

Computational Thinking in Multiple Representations

Alistair G. Stead

Introduction

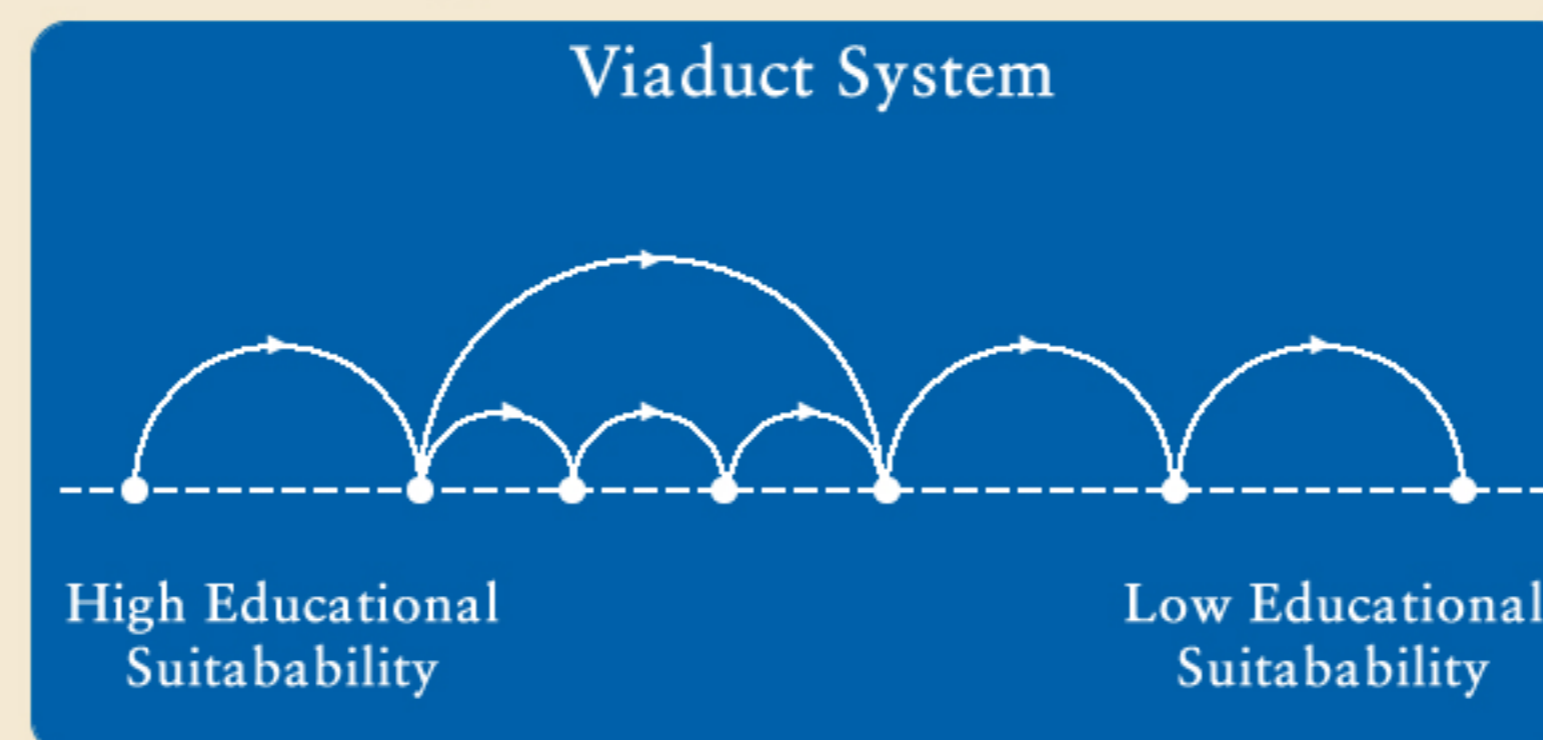

Some computational thinking concepts are easily taught using tangible or pictorial media, while others are best expressed with conventional textual languages. Teachers often combine different media and programming styles – our goal is to identify ways that multi-representation systems can support this.

Each tool uses a different representation that is particularly suited for teaching appropriate CT concepts. During student learning, there are **two** transitions -- educational suitability, and tangibility of the supporting system.

Research Methods

- Each change of representation brings new concepts and barriers.
- We can reduce these barriers by supporting students' needs using an appropriate representation for their understanding, and ensuring the transition between representations is smooth and well-supported.

- We are currently conducting semi-structured interviews with teachers regarding current tools and practices. The results will inform the design of the system and its use of representation.
- We have developed a prototype demonstration that uses three representations. We hope to gain early feedback on design.
- We are investigating whether it is possible and appropriate for higher-ability students to skip representations.
