Understanding Smartphone Usage

Daniel T. Wagner, Andrew Rice, Alastair R. Beresford

On a typical day you will visit places that are **3.8 km** apart. 1 in 5 people will move **1.5 km** on average per day, one will move **66.4 km** on average per day. The furthest we've seen anybody travel in a single day is **18886 km**.

On days when wifi is turned on for at least one hour, you see an average of **17** unique networks. Devices in our dataset have seen on average **584** networks.

On a typical day you send and receive **2** text messages a day. However, the average is **11** messages a day. The average message has **55** characters.

Half of your phone calls last no longer than **one** minute and **89%** are shorter than **5** minutes.

Every **third** call is not answered and half of all callers give up after **20** seconds, which is **4** seconds longer than it takes you to answer **90%** of your calls.

Most days you start no more than **9** apps, including core system components. One in five days you only start **4** apps.

Bluetooth

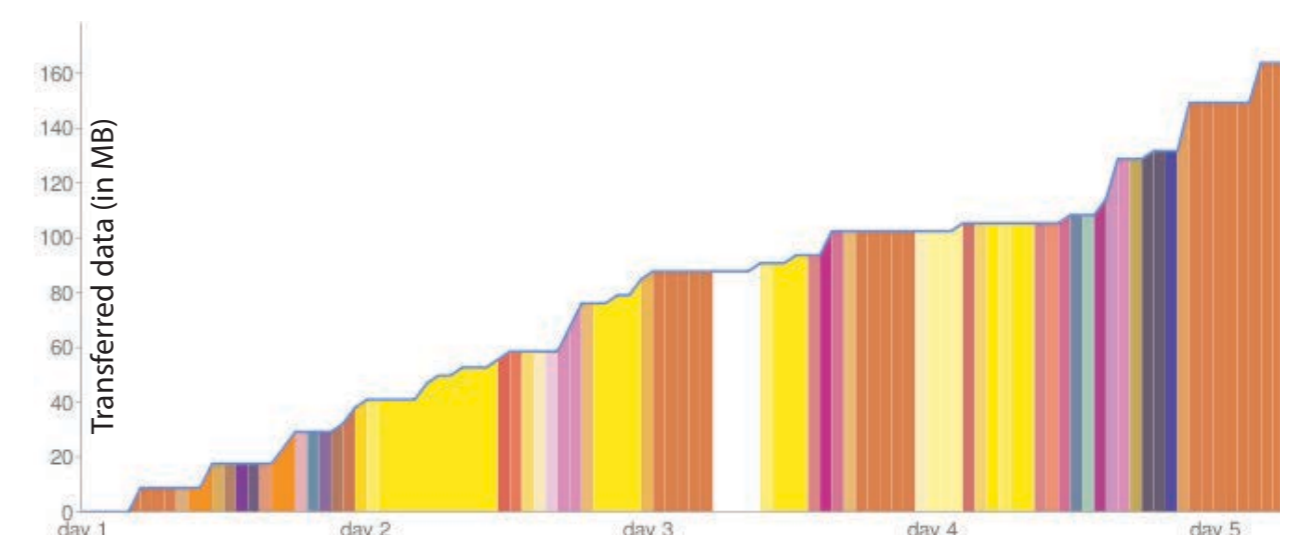

One in **10** people spends over **76%** of time on a 2G network. A typical user spends **70%** of time on either 3G or WiFi.

You turn the screen of your phone on **57** times a day but 1 in 5 times will switch it off again within **4.1** seconds.

When you plug your phone into an AC charger you will unplug it within **9** minutes 1 in 5 times. Equally likely, it will remain plugged in for at least **5h 7m**.

Over night, the longest 20% of charges last at least **8h 30m**.

Over half of our participants activate Bluetooth at most **1 in 14** days. On those days Bluetooth is active for **52** minutes for a typical user.

These statistics are based on over 1,400 years of usage data. 12,500 participants contributed data from 920 types of Android phones.

Why collect this data?

- If you want to make informed choices when designing mobile devices it is necessary to know how current devices are used
- It is difficult to know what people do with their smart phones
- Diary studies cover only small numbers of people and often suffer from omissions and low level of detail
- Network operators know some aspects of your phone use, but don't have the ability to characterize modern smartphone use well

How do we protect Personal Data?

- Hashing & aliases protect identifying data
- In-app overview of last sampled data
- There is in-app information about the possible privacy implications of sharing data
- A periodic reminder ensures that users are aware that their data is being collected
- Users can specify that they want their data to be released to University of Cambridge only
- Different types of data can be excluded from a publicly shared dataset
- There is a 3 month period where users can review their data before it is published.
- If the user is concerned about the privacy impact of sharing the reviewed data they can change sharing preferences or withdraw from the study entirely.
- We will delete all data on request

What is the Motivation for contributing?

- Participate in research
- Get statistics about your own phone use
- Analyze your usage history on the website and compare yourself with other people
- Find new applications based on your usage
- Get phone tariff recommendations based on your past usage behavior
