1.11.22 The topology generated by some (open) subsets

In the definition below of a generated topology, the *Empty* case is not necessary, as it follows from *UN* taking for *K* the empty set. However, it is convenient to have, and is never a problem in proofs, so I prefer to write it down explicitly.

We do not require *UNIV* to be an open set, as this will not be the case in applications. (We are thinking of a topology on a subset of *UNIV*, the remaining part of *UNIV* being irrelevant.)

inductive *generate_topology_on* **for** *S* **where**
Empty: *generate_topology_on S* {}
| *Int*: *generate_topology_on S a* ⟹ *generate_topology_on S b* ⟹ *generate_topology_on S* (*a* ∩ *b*)

1.11.25 Pullback topology

Pulling back a topology by map gives again a topology. *subtopology* is a special case of this notion, pulling back by the identity. We introduce the general notion as we will need it to define the strong operator topology on the space of continuous linear operators, by pulling back the product topology on the space of all functions.

pullback_topology A f T is the pullback of the topology T by the map f on the set A.

definition *pullback_topology*::('*a set*) ⇒ ('*a* ⇒ '*b*) ⇒ ('*b topology*) ⇒ ('*a topology*)
where *pullback_topology A f T* = *topology* (λ*S*. ∃ *U*. *openin T U* ∧ *S* = *f*−‘*U* ∩ *A*)

2.2.1 Abstract

The following document presents a proof that the Continuum is uncountable. It is formalised in the Isabelle/Isar theorem proving system.

Theorem: The Continuum $\mathbb{R}$ is not denumerable. In other words, there does not exist a function f: $\mathbb{N} \Rightarrow \mathbb{R}$ such that f is surjective.

Outline: An elegant informal proof of this result uses Cantor's Diagonalisation argument. The proof presented here is not this one.

First we formalise some properties of closed intervals, then we prove the Nested Interval Property. This property relies on the completeness of the Real numbers and is the foundation for our argument. Informally it states that an intersection of countable closed intervals (where each successive interval is a subset of the last) is non-empty. We then assume a surjective function f: $\mathbb{N} \Rightarrow \mathbb{R}$ exists and find a real x such that x is not in the range of f by generating a sequence of closed intervals then using the Nested Interval Property.

theorem *real_non_denum*: $\nexists f$ :: *nat* $\Rightarrow$ *real*. *surj f*
proof
assume $\exists f$::*nat* $\Rightarrow$ *real*. *surj f*
then obtain *f* :: *nat* $\Rightarrow$ *real* **where** *surj f* **..**

First we construct a sequence of nested intervals, ignoring *range f*.

have *a* < *b* $\Longrightarrow$ $\exists$ *ka kb*. *ka* < *kb* $\wedge$ {*ka*..*kb*} $\subseteq$ {*a*..*b*} $\wedge$ *c* $\notin$ {*ka*..*kb*} **for** *a b c* :: *real*
by (*auto simp add*: *not_le cong*: *conj_cong*)
(*metis dense le_less_linear less_linear less_trans order_refl*)

```
  then obtain i j where ij:
    a < b ⟹ i a b c < j a b c
      a < b ⟹ {i a b c .. j a b c} ⊆ {a .. b}
      a < b ⟹ c ∉ {i a b c .. j a b c}
    for a b c :: real
    by metis

  define ivl where ivl =
    rec_nat (f 0 + 1, f 0 + 2) (λn x. (i (fst x) (snd x) (f n), j (fst x) (snd x) (f
n)))
  define I where I n = {fst (ivl n) .. snd (ivl n)} for n

  have ivl [simp]:
    ivl 0 = (f 0 + 1, f 0 + 2)
    ⋀n. ivl (Suc n) = (i (fst (ivl n)) (snd (ivl n)) (f n), j (fst (ivl n)) (snd (ivl n))
(f n))
    unfolding ivl_def by simp_all
```

This is a decreasing sequence of non-empty intervals.

```
  have less: fst (ivl n) < snd (ivl n) for n
    by (induct n) (auto intro!: ij)

  have decseq I
    unfolding I_def decseq_Suc_iff ivl fst_conv snd_conv
    by (intro ij allI less)
```

Now we apply the finite intersection property of compact sets.

```
  have I 0 ∩ (⋂ i. I i) ≠ {}
  proof (rule compact_imp_fip_image)
    fix S :: nat set
    assume fin: finite S
    have {} ⊂ I (Max (insert 0 S))
      unfolding I_def using less[of Max (insert 0 S)] by auto
    also have I (Max (insert 0 S)) ⊆ (⋂ i∈insert 0 S. I i)
      using fin decseqD[OF ‹decseq I›, of _ Max (insert 0 S)]
      by (auto simp: Max_ge_iff)
    also have (⋂ i∈insert 0 S. I i) = I 0 ∩ (⋂ i∈S. I i)
      by auto
    finally show I 0 ∩ (⋂ i∈S. I i) ≠ {}
      by auto
  qed (auto simp: I_def)
  then obtain x where x ∈ I n for n
    by blast
  moreover from ‹surj f› obtain j where x = f j
    by blast
  ultimately have f j ∈ I (Suc j)
    by blast
  with ij(3)[OF less] show False
    unfolding I_def ivl fst_conv snd_conv by auto
```

2.5 Function Topology

We want to define the general product topology.

The product topology on a product of topological spaces is generated by the sets which are products of open sets along finitely many coordinates, and the whole space along the other coordinates. This is the coarsest topology for which the projection to each factor is continuous.

To form a product of objects in Isabelle/HOL, all these objects should be subsets of a common type 'a. The product is then $Pi_E\ I\ X$, the set of elements from $'i$ to $'a$ such that the i-th coordinate belongs to $X\ i$ for all $i \in I$.

Hence, to form a product of topological spaces, all these spaces should be subsets of a common type. This means that type classes can not be used to define such a product if one wants to take the product of different topological spaces (as the type 'a can only be given one structure of topological space using type classes). On the other hand, one can define different topologies (as introduced in *thy*) on one type, and these topologies do not need to share the same maximal open set. Hence, one can form a product of topologies in this sense, and this works well. The big caveat is that it does not interact well with the main body of topology in Isabelle/HOL defined in terms of type classes... For instance, continuity of maps is not defined in this setting.

As the product of different topological spaces is very important in several areas of mathematics (for instance adeles), I introduce below the product topology in terms of topologies, and reformulate afterwards the consequences in terms of type classes (which are of course very handy for applications).

Given this limitation, it looks to me that it would be very beneficial to revamp the theory of topological spaces in Isabelle/HOL in terms of topologies, and keep the statements involving type classes as consequences of more general statements in terms of topologies (but I am probably too naive here).

Here is an example of a reformulation using topologies. Let

$$\begin{aligned}&\mathit{continuous\_map}\ T1\ T2\ f =\\ &\quad((\forall\ U.\ \mathit{openin}\ T2\ U \longrightarrow \mathit{openin}\ T1\ (f-`U \cap \mathit{topspace}(T1)))\\ &\qquad\wedge\ (f`(\mathit{topspace}\ T1) \subseteq (\mathit{topspace}\ T2)))\end{aligned}$$

be the natural continuity definition of a map from the topology *T1* to the topology *T2*. Then the current *continuous_on* (with type classes) can be redefined as

continuous_on s f =
continuous_map (*top_of_set s*) (*topology euclidean*) *f*

In fact, I need *continuous_map* to express the continuity of the projection on subfactors for the product topology, in Lemma *continuous_on_restrict_product_topology*, and I show the above equivalence in Lemma *continuous_map_iff_continuous*.

I only develop the basics of the product topology in this theory. The most important missing piece is Tychonov theorem, stating that a product of compact spaces is always compact for the product topology, even when the product is not finite (or even countable).

I realized afterwards that this theory has a lot in common with `~~/src/HOL/Library/Finite_Map.thy`.

2.5.1 The product topology

We can now define the product topology, as generated by the sets which are products of open sets along finitely many coordinates, and the whole space along the other coordinates. Equivalently, it is generated by sets which are one open set along one single coordinate, and the whole space along other coordinates. In fact, this is only equivalent for nonempty products, but for the empty product the first formulation is better (the second one gives an empty product space, while an empty product should have exactly one point, equal to *undefined* along all coordinates.

So, we use the first formulation, which moreover seems to give rise to more straightforward proofs.

definition *product_topology*::('*i* ⇒ ('*a topology*)) ⇒ ('*i set*) ⇒ (('*i* ⇒ '*a*) *topology*)
where *product_topology T I* =
topology_generated_by {(Π$_E$ *i*∈*I*. *X i*) |*X*. (∀ *i*. *openin* (*T i*) (*X i*)) ∧ *finite* {*i*. *X i* ≠ *topspace* (*T i*)}}

abbreviation *powertop_real* :: '*a set* ⇒ ('*a* ⇒ *real*) *topology*
where *powertop_real* ≡ *product_topology* (λ*i*. *euclideanreal*)

The total set of the product topology is the product of the total sets along each coordinate.

5.4 Homotopy of Maps

theory *Homotopy*
imports *Path_Connected Product_Topology Uncountable_Sets*
begin

definition *homotopic_with*
where
homotopic_with P X Y f g ≡
(∃ *h*. *continuous_map* (*prod_topology* (*top_of_set* {*0..1*::*real*}) *X*) *Y h* ∧
(∀ *x*. *h*(*0*, *x*) = *f x*) ∧
(∀ *x*. *h*(*1*, *x*) = *g x*) ∧
(∀ *t* ∈ {*0..1*}. *P*(λ*x*. *h*(*t*,*x*))))

p, *q* are functions $X \to Y$, and the property P restricts all intermediate maps. We often just want to require that P fixes some subset, but to include the case of a loop homotopy, it is convenient to have a general property P.

abbreviation *homotopic_with_canon* ::
