Knapsack

KNAPSACK is a problem which generalises many natural scheduling and optimisation problems, and through reductions has been used to show many such problems **NP**-complete.

In the problem, we are given n items, each with a positive integer value v_i and weight w_i .

We are also given a maximum total weight W , and a minimum total value V .

Can we select a subset of the items whose total weight does not exceed W , and whose total value exceeds V ?

Scheduling

Some examples of the kinds of scheduling tasks that have been proved **NP**-complete include:

Timetable Design

Given a set H of *work periods*, a set W of *workers* each with an associated subset of H (available periods), a set T of *tasks* and an assignment $r : W \times T \rightarrow \mathbb{N}$ of *required work*, is there a mapping $f : W \times T \times H \rightarrow \{0, 1\}$ which completes all tasks?

Scheduling

Sequencing with Deadlines

Given a set T of *tasks* and for each task a *length* $l \in \mathbb{N}$, a release time $r \in \mathbb{N}$ and a deadline $d \in \mathbb{N}$, is there a work schedule which completes each task between its release time and its deadline?

Job Scheduling

Given a set T of *tasks*, a number $m \in \mathbb{N}$ of processors a length $l \in \mathbb{N}$ for each task, and an overall deadline $D \in \mathbb{N}$, is there a multi-processor schedule which completes all tasks by the deadline?

Responses to NP-Completeness

Confronted by an NP-complete problem, say constructing a timetable, what can one do?

- It's a single instance, does asymptotic complexity matter?
- What's the critical size? Is scalability important?
- Are there guaranteed restrictions on the input? Will a special purpose algorithm suffice?
- Will an approximate solution suffice? Are performance guarantees required?
- Are there useful heuristics that can constrain a search? Ways of ordering choices to control backtracking?

Validity

We define **VAL**—the set of *valid* Boolean expressions—to be those Boolean expressions for which every assignment of truth values to variables yields an expression equivalent to **true**.

$$\phi \in \text{VAL} \Leftrightarrow \neg\phi \notin \text{SAT}$$

By an exhaustive search algorithm similar to the one for **SAT**, **VAL** is in $\text{TIME}(n^2 2^n)$.

Is $\text{VAL} \in \text{NP}$?

Validity

$\overline{\text{VAL}} = \{\phi \mid \phi \notin \text{VAL}\}$ —the *complement* of **VAL** is in **NP**.

Guess a *falsifying* truth assignment and verify it.

Such an algorithm does not work for **VAL**.

In this case, we have to determine whether *every* truth assignment results in **true**—a requirement that does not sit as well with the definition of acceptance by a nondeterministic machine.

Complementation

If we interchange accepting and rejecting states in a deterministic machine that accepts the language L , we get one that accepts \overline{L} .

If a language $L \in \text{P}$, then also $\overline{L} \in \text{P}$.

Complexity classes defined in terms of nondeterministic machine models are not necessarily closed under complementation of languages.

Define,

co-NP – the languages whose complements are in **NP**.

Succinct Certificates

The complexity class **NP** can be characterised as the collection of languages of the form:

$$L = \{x \mid \exists y R(x, y)\}$$

Where R is a relation on strings satisfying two key conditions

1. R is decidable in polynomial time.
2. R is *polynomially balanced*. That is, there is a polynomial p such that if $R(x, y)$ and the length of x is n , then the length of y is no more than $p(n)$.

Succinct Certificates

y is a *certificate* for the membership of x in L .

Example: If L is **SAT**, then for a satisfiable expression x , a certificate would be a satisfying truth assignment.

co-NP

As **co-NP** is the collection of complements of languages in **NP**, and **P** is closed under complementation, **co-NP** can also be characterised as the collection of languages of the form:

$$L = \{x \mid \forall y |y| < p(|x|) \rightarrow R'(x, y)\}$$

NP – the collection of languages with succinct certificates of membership.

co-NP – the collection of languages with succinct certificates of disqualification.

Any of the situations is consistent with our present state of knowledge:

- $P = NP = \text{co-NP}$
- $P = NP \cap \text{co-NP} \neq NP \neq \text{co-NP}$
- $P \neq NP \cap \text{co-NP} = NP = \text{co-NP}$
- $P \neq NP \cap \text{co-NP} \neq NP \neq \text{co-NP}$
