

Statistical Machine Translation

Lecture 5

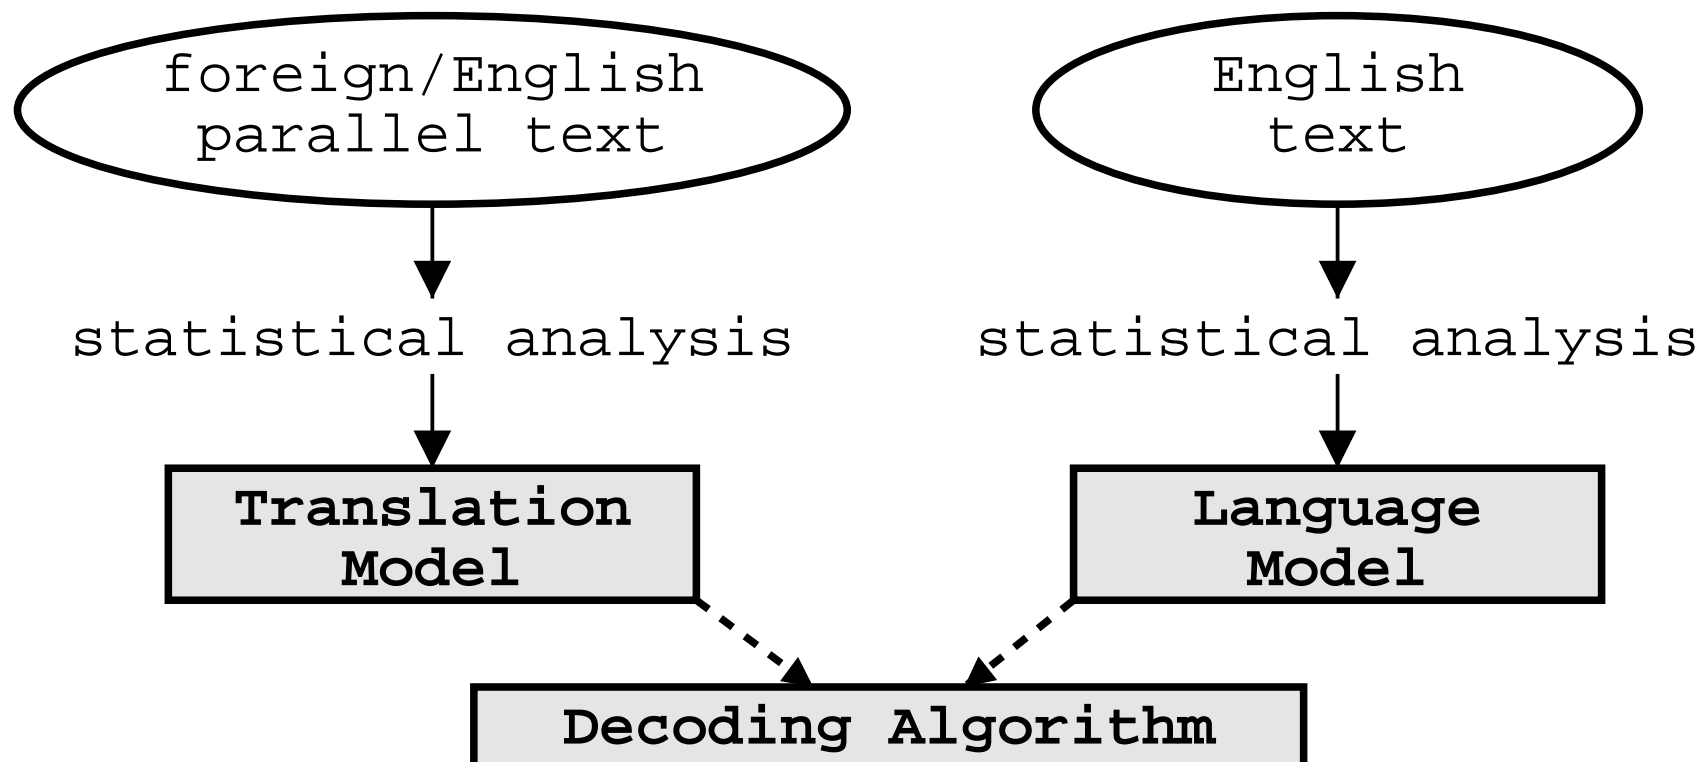

Decoding with Phrase-Based Models

Stephen Clark

based on slides by Phillip Koehn

Statistical Machine Translation

- Components: Translation model, language model, decoder

Phrase-Based Translation

- Foreign input is segmented in phrases
 - any sequence of words, not necessarily linguistically motivated
- Each phrase is translated into English
- Phrases are reordered

Phrase Translation Table

- Phrase Translations for “den Vorschlag”:

English	$\phi(\mathbf{e} \mathbf{f})$	English	$\phi(\mathbf{e} \mathbf{f})$
the proposal	0.6227	the suggestions	0.0114
's proposal	0.1068	the proposed	0.0114
a proposal	0.0341	the motion	0.0091
the idea	0.0250	the idea of	0.0091
this proposal	0.0227	the proposal ,	0.0068
proposal	0.0205	its proposal	0.0068
of the proposal	0.0159	it	0.0068
the proposals	0.0159

Decoding Process

Maria	no	dio	una	bofetada	a	la	bruja	verde
-------	----	-----	-----	----------	---	----	-------	-------

- Build translation left to right
 - select foreign words to be translated

Decoding Process

- Build translation left to right
 - select foreign words to be translated
 - find English phrase translation
 - add English phrase to end of partial translation

Decoding Process

María	no	dio	una	bofetada	a	la	bruja	verde
-------	----	-----	-----	----------	---	----	-------	-------

Mary

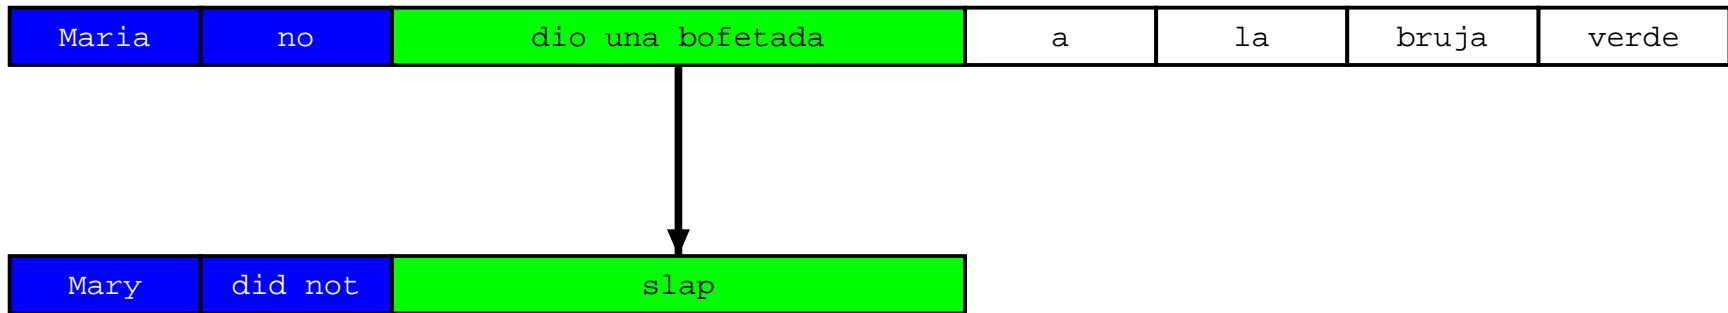

- Build translation left to right
 - select foreign words to be translated
 - find English phrase translation
 - add English phrase to end of partial translation
 - mark foreign words as translated

Decoding Process

- One to many translation

Decoding Process

- Many to one translation

Decoding Process

- Many to one translation

Decoding Process

- Reordering

Decoding Process

- Translation finished

Translation Options

Maria	no	dio	una	bofetada	a	la	bruja	verde
-------	----	-----	-----	----------	---	----	-------	-------

<u>Mary</u>	<u>not</u>	<u>give</u>	<u>a</u>	<u>slap</u>	<u>to</u>	<u>the</u>	<u>witch</u>	<u>green</u>
	<u>did not</u>		<u>a slap</u>		<u>by</u>		<u>green witch</u>	
	<u>no</u>		<u>slap</u>		<u>to the</u>			
	<u>did not give</u>				<u>to</u>			
					<u>the</u>			
			<u>slap</u>			<u>the witch</u>		

- Look up possible phrase translations
 - many different ways to segment words into phrases
 - many different ways to translate each phrase

Hypothesis Expansion

Maria	no	dio	una	bofetada	a	la	bruja	verde
-------	----	-----	-----	----------	---	----	-------	-------

<u>Mary</u>	<u>not</u>	<u>give</u>	<u>a</u>	<u>slap</u>	<u>to</u>	<u>the</u>	<u>witch</u>	<u>green</u>
	<u>did not</u>		<u>a</u>	<u>slap</u>	<u>by</u>		<u>green</u>	<u>witch</u>
	<u>no</u>		<u>slap</u>		<u>to the</u>			
	<u>did not give</u>				<u>to</u>			
					<u>the</u>			
			<u>slap</u>			<u>the</u>	<u>witch</u>	

```
e:
f: -----
p: 1
```

- Start with empty hypothesis
 - e: no English words
 - f: no foreign words covered
 - p: probability 1

Hypothesis Expansion

Maria	no	dio	una	bofetada	a	la	bruja	verde
Mary	<u>not</u>	<u>give</u>	<u>a</u>	<u>slap</u>	<u>to</u>	<u>the</u>	<u>witch</u>	<u>green</u>
	<u>did not</u>		<u>a slap</u>		<u>by</u>		<u>green witch</u>	
	<u>no</u>		<u>slap</u>		<u>to the</u>			
	<u>did not give</u>				<u>to</u>			
					<u>the</u>			
				<u>slap</u>			<u>the witch</u>	

- Pick translation option
- Create hypothesis
 - e: add English phrase Mary
 - f: first foreign word covered
 - p: probability 0.534

A Quick Word on Probabilities

- Not going into detail here, but...
- Translation Model
 - phrase translation probability $p(\text{Mary}|\text{Maria})$
 - reordering costs
 - phrase/word count costs
 - ...
- Language Model
 - uses trigrams:
 - $p(\text{Mary did not}) = p(\text{Mary} | \langle s \rangle) * p(\text{did} | \text{Mary}, \langle s \rangle) * p(\text{not} | \text{Mary did})$

Hypothesis Expansion

Maria	no	dio	una	bofetada	a	la	bruja	verde
-------	----	-----	-----	----------	---	----	-------	-------

Mary not give a slap to the witch green
did not a slap by green witch
no slap to the
did not give to
slap the witch

- Add another hypothesis

Hypothesis Expansion

Maria	no	dio una bofetada	a	la	bruja	verde
-------	----	------------------	---	----	-------	-------

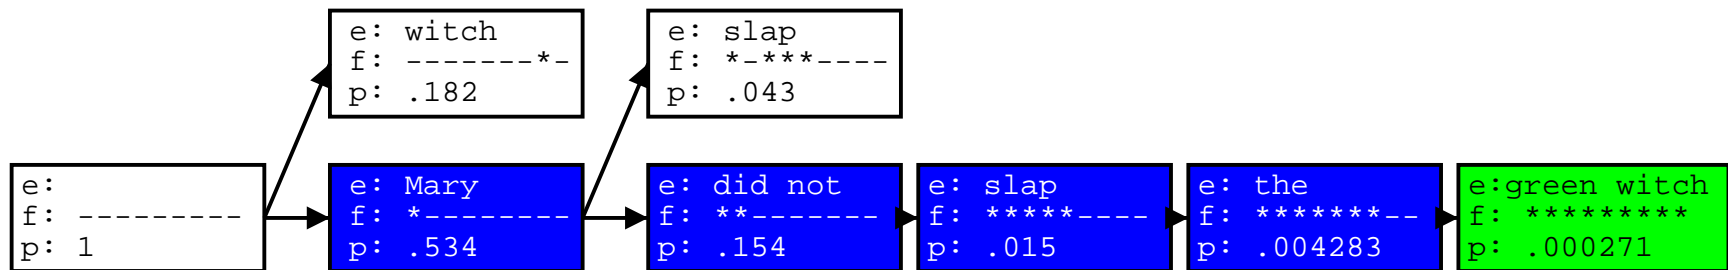

Mary not give a slap to the witch green
did not a slap by green witch
no slap to the
did not give to
the
slap the witch

- Further hypothesis expansion

Hypothesis Expansion

Maria	no	dio una bofetada	a la	bruja verde				
Mary	not	give	a	slap	to	the	witch	green
	did not		a	slap	by		green	witch
	no		slap		to the			
	did not give				to			
					the			
			slap			the	witch	

- ... until all foreign words covered
 - find best hypothesis that covers all foreign words
 - backtrack to read off translation

Explosion of Search Space

- Number of hypotheses is exponential with respect to sentence length
- ⇒ Decoding is NP-complete [Knight, 1999]
- ⇒ Need to reduce search space
 - risk free: hypothesis recombination
 - risky: histogram/threshold pruning

Hypothesis Recombination

- Different paths to the same partial translation

Hypothesis Recombination

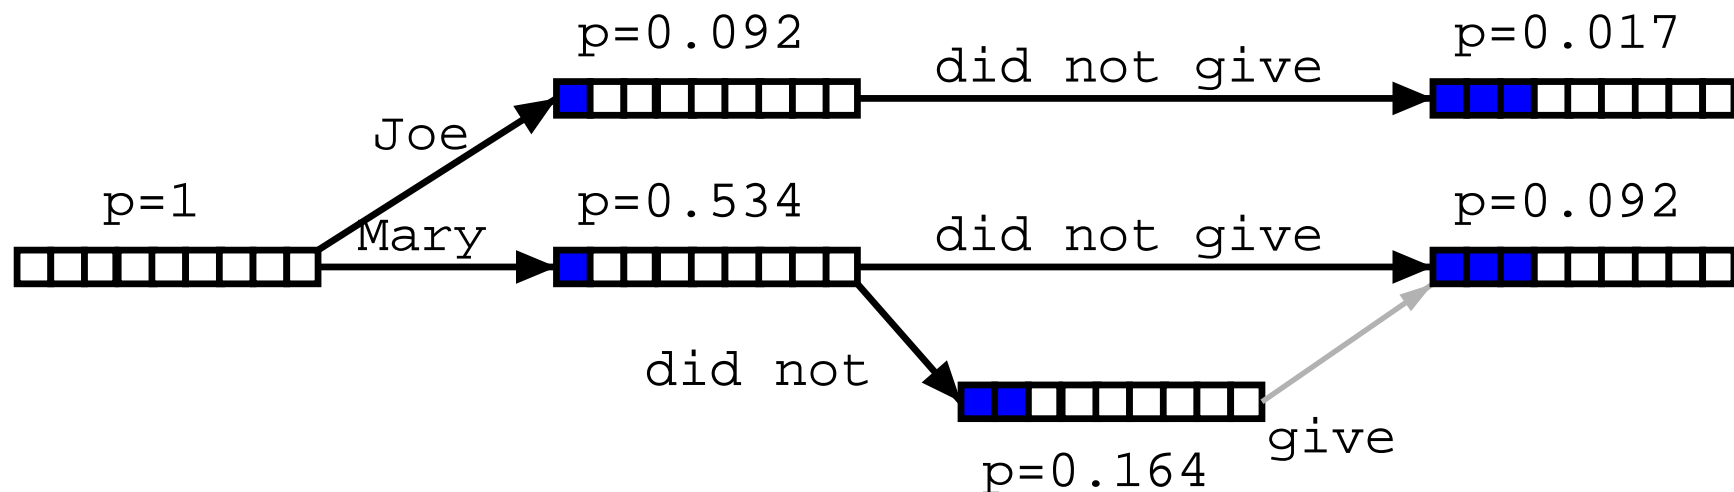

- Different paths to the same partial translation

⇒ Combine paths

- drop weaker hypothesis
- keep pointer from worse path

Hypothesis Recombination

- Recombined hypotheses do not have to match completely
- No matter what is added, weaker path can be dropped, if:
 - last two English words match (matters for language model)
 - foreign word coverage vectors match (affects future path)

Hypothesis Recombination

- Recombined hypotheses do not have to match completely
- No matter what is added, weaker path can be dropped, if:
 - last two English words match (matters for language model)
 - foreign word coverage vectors match (effects future path)

⇒ Combine paths

Pruning

- Hypothesis recombination is not sufficient

⇒ Heuristically discard weak hypotheses

- Organize Hypothesis in stacks, e.g. by
 - same foreign words covered
 - same number of foreign words covered
 - same number of English words produced
- Compare hypotheses in stacks, discard bad ones
 - histogram pruning: keep top n hypotheses in each stack (e.g., $n=100$)
 - threshold pruning: keep hypotheses that are at most α times the cost of best hypothesis in stack (e.g., $\alpha = 0.001$)

Hypothesis Stacks

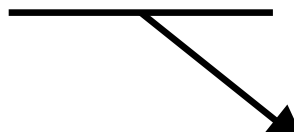

- Organization of hypothesis into stacks
 - here: based on number of foreign words translated
 - during translation all hypotheses from one stack are expanded
 - expanded Hypotheses are placed into stacks

Comparing Hypotheses

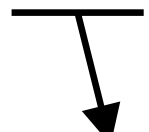

- Comparing hypotheses with same number of foreign words covered

Maria no dio una bofetada a la bruja verde

```
e: Mary did not
f: **-----
p: 0.154
```

**better
partial
translation**

```
e: the
f: -----**--
p: 0.354
```

**covers
easier part
--> lower cost**

- Hypothesis that covers easy part of sentence is preferred

⇒ Need to consider future cost of uncovered parts
