MPhil in Advanced Computer Science
Interactive Formal Verification

Leader:	Mike Gordon (course lecturer: Dr. Tjark Weber)
Timing:	Lent
Prerequisites:	familiarity with elementary logic, functional programming and operational semantics
Structure:	12 Lectures and 4 Practical Classes

AIMS

This module introduces students to interactive theorem proving using Isabelle. It includes techniques for specifying formal models of software and hardware systems and for deriving properties of these models.

SYLLABUS

1. Introduction to interactive theorem provers and higher-order logic.
2. Theories. Declaring recursive datatypes and functions.
3. Proofs. Simplification heuristics.
4. Recursion, Induction and Simplification.
5. Predicate Logic in Isabelle.
6. Set-theoretic primitives, notation and reasoning methods.
7. Inductive definitions and proofs involving them.
8. Structured proofs.
9. Applications and case studies.

OBJECTIVES

On completion of this module students should

- possess basic skills in the use of Isabelle
- be able to specify inductive definitions and perform proofs by induction
- be able to express a variety of specifications in higher-order logic
- be able to write structured proofs of nontrivial results.

COURSEWORK

Each candidate will undertake two small formalisations, which will serve as the basis for assessment.

PRACTICAL WORK

Four supervised practical sessions will allow students to develop skills.

ASSESSMENT

Each student must undertake two small verification projects, delivering a practical write-up accompanied by an Isabelle theory file. These will be started during the practical sessions but will probably be completed on the student's own time. These projects will assess the extent to which each candidate has absorbed the syllabus and develop practical skills. The course lecturer will set and mark the assessments. The mark will be reported as a percentage.
