# The halting problem

**Definition.** A register machine H decides the Halting Problem if for all  $e, a_1, \ldots, a_n \in \mathbb{N}$ , starting H with

$$R_0 = 0$$
  $R_1 = e$   $R_2 = \lceil [a_1, \dots, a_n] \rceil$ 

and all other registers zeroed, the computation of H always halts with  $R_0$  containing 0 or 1; moreover when the computation halts,  $R_0 = 1$  if and only if

the register machine program with index e eventually halts when started with  $R_0 = 0$ ,  $R_1 = a_1, \ldots, R_n = a_n$  and all other registers zeroed.

**Definition.** A register machine H decides the Halting Problem if for all  $e, a_1, \ldots, a_n \in \mathbb{N}$ , starting H with

$$R_0 = 0$$
  $R_1 = e$   $R_2 = \lceil [a_1, \dots, a_n] \rceil$ 

and all other registers zeroed, the computation of H always halts with  $R_0$  containing 0 or 1; moreover when the computation halts,  $R_0 = 1$  if and only if

the register machine program with index e eventually halts when started with  $R_0 = 0$ ,  $R_1 = a_1, \ldots, R_n = a_n$  and all other registers zeroed.

**Theorem.** No such register machine  $\mathbf{H}$  can exist.

Assume we have a RM H that decides the Halting Problem and derive a contradiction, as follows:

► Let H' be obtained from H by replacing START → by START →  $\boxed{Z ::= R_1}$  →  $\boxed{\begin{array}{c} push \ Z \\ to \ R_2 \end{array}}$  → (where Z is a register not mentioned in H's program).

Let C be obtained from H' by replacing each HALT (& each erroneous halt) by  $\longrightarrow R_0^- \longrightarrow R_0^+$ .

each erroneous halt) by  $\longrightarrow R_0^- \longrightarrow R_0^+$ .

HALT

▶ Let  $c \in \mathbb{N}$  be the index of C's program.

Assume we have a RM H that decides the Halting Problem and derive a contradiction, as follows:

C started with  $R_1=c$  eventually halts if & only if H' started with  $R_1=c$  halts with  $R_0=0$ 

<u>L</u>5

Assume we have a RM H that decides the Halting Problem and derive a contradiction, as follows:

```
C started with R_1=c eventually halts if & only if H' started with R_1=c halts with R_0=0 if & only if H started with R_1=c, R_2=\lceil [c\rceil \rceil halts with R_0=0
```

Assume we have a RM H that decides the Halting Problem and derive a contradiction, as follows:

```
C started with R_1=c eventually halts if & only if H' started with R_1=c halts with R_0=0 if & only if H started with H started
```

### Computable functions

#### Recall:

**Definition.**  $f \in \mathbb{N}^n \rightarrow \mathbb{N}$  is (register machine) computable if there is a register machine M with at least n+1 registers  $R_0, R_1, \ldots, R_n$  (and maybe more) such that for all  $(x_1, \ldots, x_n) \in \mathbb{N}^n$  and all  $y \in \mathbb{N}$ , the computation of M starting with  $R_0 = 0$ ,  $R_1 = x_1, \dots, R_n = x_n$  and all other registers set to 0, halts with  $R_0 = y$ if and only if  $f(x_1, \ldots, x_n) = y$ .

Note that the same RM M could be used to compute a unary function (n = 1), or a binary function (n = 2), etc. From now on we will concentrate on the unary case...

.5

# Enumerating computable functions

For each  $e \in \mathbb{N}$ , let  $\varphi_e \in \mathbb{N} \rightarrow \mathbb{N}$  be the unary partial function computed by the RM with program prog(e). So for all  $x, y \in \mathbb{N}$ :

 $\varphi_e(x) = y$  holds iff the computation of prog(e) started with  $R_0 = 0$ ,  $R_1 = x$  and all other registers zeroed eventually halts with  $R_0 = y$ .

Thus

$$e \mapsto \varphi_e$$

defines an <u>onto</u> function from  $\mathbb{N}$  to the collection of all computable partial functions from  $\mathbb{N}$  to  $\mathbb{N}$ .

L5 5.

# Enumerating computable functions

For each  $e \in \mathbb{N}$ , let  $\varphi_e \in \mathbb{N} \rightarrow \mathbb{N}$  be the unary partial function computed by the RM with program prog(e). So for all  $x, y \in \mathbb{N}$ :

$$\varphi_e(x) = y$$
 holds iff the computation of  $prog(e)$  started with  $R_0 = 0$ ,  $R_1 = x$  and all other registers zeroed eventually halts with  $R_0 = y$ .

 $e \mapsto \varphi_e$  So this is countable defines an onto function from N to the collection of all computable partial functions from  $\mathbb N$  to  $\mathbb N$ .

Thus

### An uncomputable function

Let  $f \in \mathbb{N} \to \mathbb{N}$  be the partial function with graph  $\{(x,0) \mid \varphi_x(x) \uparrow \}$ .

$$\{(x,0) \mid \varphi_x(x) \uparrow \}.$$
Thus  $f(x) = \begin{cases} 0 & \text{if } \varphi_x(x) \uparrow \\ undefined & \text{if } \varphi_x(x) \downarrow \end{cases}$ 

# An uncomputable function

Let  $f \in \mathbb{N} \rightarrow \mathbb{N}$  be the partial function with graph

$$\{(x,0) \mid \varphi_x(x) \uparrow \}.$$
Thus  $f(x) = \begin{cases} 0 & \text{if } \varphi_x(x) \uparrow \\ undefined & \text{if } \varphi_x(x) \downarrow \end{cases}$ 

f is not computable, because if it were, then  $f = \varphi_e$  for some  $e \in \mathbb{N}$ and hence

- ightharpoonup if  $\varphi_e(e)\uparrow$ , then f(e)=0 (by def. of f); so  $\varphi_e(e)=0$  (since  $f = \varphi_e$ ), hence  $\varphi_e(e) \downarrow$
- ▶ if  $\varphi_e(e)\downarrow$ , then  $f(e)\downarrow$  (since  $f=\varphi_e$ ); so  $\varphi_e(e)\uparrow$  (by def. of f)

—contradiction! So f cannot be computable.

### (Un)decidable sets of numbers

Given a subset  $S \subseteq \mathbb{N}$ , its characteristic function

$$\chi_S \in \mathbb{N} \rightarrow \mathbb{N}$$
 is given by:  $\chi_S(x) \triangleq \begin{cases} 1 & \text{if } x \in S \\ 0 & \text{if } x \notin S. \end{cases}$ 

### (Un)decidable sets of numbers

**Definition.**  $S \subseteq \mathbb{N}$  is called (register machine) decidable if its characteristic function  $\chi_S \in \mathbb{N} \to \mathbb{N}$  is a register machine computable function. Otherwise it is called undecidable.

So S is decidable iff there is a RM M with the property: for all  $x \in \mathbb{N}$ , M started with  $R_0 = 0$ ,  $R_1 = x$  and all other registers zeroed eventually halts with  $R_0$  containing 1 or 0; and  $R_0 = 1$  on halting iff  $x \in S$ .

\_5 5

### (Un)decidable sets of numbers

**Definition.**  $S \subseteq \mathbb{N}$  is called (register machine) decidable if its characteristic function  $\chi_S \in \mathbb{N} \to \mathbb{N}$  is a register machine computable function. Otherwise it is called undecidable.

So S is decidable iff there is a RM M with the property: for all  $x \in \mathbb{N}$ , M started with  $R_0 = 0$ ,  $R_1 = x$  and all other registers zeroed eventually halts with  $R_0$  containing 1 or 0; and  $R_0 = 1$  on halting iff  $x \in S$ .

Basic strategy: to prove  $S \subseteq \mathbb{N}$  undecidable, try to show that decidability of S would imply decidability of the Halting Problem.

For example. . .

# Claim: $S_0 \triangleq \{e \mid \varphi_e(0)\downarrow\}$ is undecidable.

**Claim:**  $S_0 \triangleq \{e \mid \varphi_e(0)\downarrow\}$  is undecidable.

**Proof (sketch):** Suppose  $M_0$  is a RM computing  $\chi_{S_0}$ . From  $M_0$ 's program (using the same techniques as for constructing a universal RM) we can construct a RM H to carry out:

```
let e = R_1 and \lceil [a_1, \ldots, a_n] \rceil = R_2 in R_1 := \lceil (R_1 := a_1); \cdots; (R_n := a_n); prog(e) \rceil; R_2 := 0; run M_0
```

Then by assumption on  $M_0$ , H decides the Halting Problem—contradiction. So no such  $M_0$  exists, i.e.  $\chi_{S_0}$  is uncomputable, i.e.  $S_0$  is undecidable.

# **Claim:** $S_1 \triangleq \{e \mid \varphi_e \text{ a total function}\}$ is undecidable.

**Claim:**  $S_1 \triangleq \{e \mid \varphi_e \text{ a total function}\}\$  is undecidable.

**Proof (sketch):** Suppose  $M_1$  is a RM computing  $\chi_{S_1}$ . From  $M_1$ 's program we can construct a RM  $M_0$  to carry out:

let 
$$e = R_1$$
 in  $R_1 := \lceil R_1 := 0$ ;  $prog(e) \rceil$ ; run  $M_1$ 

Then by assumption on  $M_1$ ,  $M_0$  decides membership of  $S_0$  from previous example (i.e. computes  $\chi_{S_0}$ )—contradiction. So no such  $M_1$  exists, i.e.  $\chi_{S_1}$  is uncomputable, i.e.  $S_1$  is undecidable.
