0.1 Digital Communication II

Lecturers: Jon Crowcroft, Dr I.A.Pratt, plus guests (`jon.crowcroft@cl.cam.ac.uk`
`ian.pratt@cl.cam.ac.uk`)
 No. of lectures: 16, or so
 Prerequisite course: Digital Communication I
 This course is a prerequisite for Security (*Part II*).

Aims

This course aims to provide a detailed understanding of how computer networks operate, through the examples of the Internet, and presents ways to build such systems. It also covers a selection of topics which relate to recent trends in digital communications systems. The material falls roughly into two halves: Protocols, and Technologies/Performance.

Lectures

- **Introduction.** Course overview. Abstraction, layering. The OSI reference model. JAC

- **The Internet: IP.** IP overview/review. Networking in Unix: structures, buffering, sockets, network interfaces. IP addresses and (simple) routing. Subnetting. IP checksum. Fragmentation. JAC

- **The Internet: routing.** ROADS and CIDR. Terminology: AS, IGP, EGP. Routing protocols: distance vector *versus* link state. Examples: RIP, OSPF. AS routing: I-BGP/E-BGP, metrics. JAC

- **The Internet: UDP, TCP** TCP operation, state transitions. Handling loss: acks and retransmissions. Estimating RTT. Basic congestion control. Improving things: TCP vegas, SACKs, ECN. [JAC, 2 lectures]

- **The Internet: network resource management.** Differentiated and Integrated Services. Signaling (RSVP) and Admission Control, Forwarding and Scheduling, Policing and Shaping. The future. JAC

- **The Internet: Applications, Multimedia, NFS & HTTP** RTP operation, Playout adaption; RPC & Network File Systems; HTTP, HTTP 1.1 - making it all work JAC

- **The Internet: multicast and QoS routing.** Other TCP details. Internet multicast model. Applications. Basic implementation. Refinements. JAC

- **Pricing and other Miscellany.** Model and motivation. Practical considerations. The future. JAC

- **ATM case study** Multiplexing and virtual circuits. Signalling. ATM Adaption Layers. Quality of Service CBR, VBR, ABR. IAP

- **Wide Area Networks.** Fibre Technology. Long-haul link design. Dense Wave Division Multiplexing. Sonet/SDH. MPLS. Packet over SONET. Optical switching. IAP

- **Access Networks.** Cable Modems. xDSL. Fixed wireless. Satellite. Firewalls and Network Address Translation. IAP

- **Local Area Networks and System Area Networks.** Fast/Gigabit Ethernet. Optimising latency. Host interface design. User-space protocol processing. IAP

Objectives

At the end of the course students should be able to

- enumerate and explain the layers of the OSI reference model

- compare and contrast connectionless and connection-oriented networks

- explain how IP routing works

- describe the components of the Internet resource management system

- describe how and why TCP attempts to handle congestion in the network
