1 The Message Theory, Modified for SET

theory *Message_SET*
imports *Main "HOL-Library.Nat_Bijection"*
begin

1.1 General Lemmas

Needed occasionally with *spy_analz_tac*, e.g. in *analz_insert_Key_newK*

lemma *Un_absorb3 [simp] : "A ∪ (B ∪ A) = B ∪ A"*
by *blast*

Collapses redundant cases in the huge protocol proofs

lemmas *disj_simps = disj_comms disj_left_absorb disj_assoc*

Effective with assumptions like *K ∉ range pubK* and *K ∉ invKey ‘ range pubK*

lemma *notin_image_iff: "(y ∉ f‘I) = (∀i∈I. f i ≠ y)"*
by *blast*

Effective with the assumption *KK ⊆ - range (invKey ∘ pubK)*

lemma *disjoint_image_iff: "(A ⊆ - (f‘I)) = (∀i∈I. f i ∉ A)"*
by *blast*

type_synonym *key = nat*

consts
all_symmetric :: bool — true if all keys are symmetric
invKey :: "key⇒key" — inverse of a symmetric key

specification *(invKey)*
invKey [simp]: "invKey (invKey K) = K"
invKey_symmetric: "all_symmetric ⟶ invKey = id"
by *(rule exI [of _ id], auto)*

The inverse of a symmetric key is itself; that of a public key is the private key and vice versa

definition *symKeys :: "key set"* **where**
"symKeys == {K. invKey K = K}"

Agents. We allow any number of certification authorities, cardholders merchants, and payment gateways.

datatype
agent = CA nat | Cardholder nat | Merchant nat | PG nat | Spy

Messages

datatype
msg = Agent agent — Agent names
| Number nat — Ordinary integers, timestamps, ...
| Nonce nat — Unguessable nonces

```
  | Pan    nat        — Unguessable Primary Account Numbers (??)
  | Key    key        — Crypto keys
  | Hash   msg        — Hashing
  | MPair  msg msg    — Compound messages
  | Crypt  key msg    — Encryption, public- or shared-key
```

syntax
```
  "_MTuple" :: "['a, args] ⇒ 'a * 'b"  (‹(‹indent=2 notation=‹mixfix message
tuple››{|_,/ _|})›)
```
syntax_consts
```
  "_MTuple" ⇌ MPair
```
translations
```
  "{|x, y, z|}" ⇌ "{|x, {|y, z|}|}"
  "{|x, y|}" ⇌ "CONST MPair x y"
```

definition *nat_of_agent :: "agent ⇒ nat"* **where**
```
   "nat_of_agent == case_agent (curry prod_encode 0)
                               (curry prod_encode 1)
                               (curry prod_encode 2)
                               (curry prod_encode 3)
                               (prod_encode (4,0))"
```
— maps each agent to a unique natural number, for specifications

The function is indeed injective

lemma *inj_nat_of_agent: "inj nat_of_agent"*
by *(simp add: nat_of_agent_def inj_on_def curry_def prod_encode_eq split: agent.split)*

definition

```
  keysFor :: "msg set ⇒ key set"
  where "keysFor H = invKey ‘ {K. ∃X. Crypt K X ∈ H}"
```

1.1.1 Inductive definition of all "parts" of a message.

inductive_set
```
  parts :: "msg set ⇒ msg set"
  for H :: "msg set"
  where
    Inj [intro]:               "X ∈ H ==> X ∈ parts H"
  | Fst:         "{|X,Y|}   ∈ parts H ==> X ∈ parts H"
  | Snd:         "{|X,Y|}   ∈ parts H ==> Y ∈ parts H"
  | Body:        "Crypt K X ∈ parts H ==> X ∈ parts H"
```

lemma *parts_mono: "G⊆H ==> parts(G) ⊆ parts(H)"*
apply *auto*
apply *(erule parts.induct)*
apply *(auto dest: Fst Snd Body)*

done

1.1.2 Inverse of keys

lemma *Key_image_eq [simp]: "(Key x ∈ Key‘A) = (x∈A)"*
by *auto*

lemma *Nonce_Key_image_eq [simp]: "(Nonce x ∉ Key‘A)"*
by *auto*

lemma *Cardholder_image_eq [simp]: "(Cardholder x ∈ Cardholder‘A) = (x ∈ A)"*
by *auto*

lemma *CA_image_eq [simp]: "(CA x ∈ CA‘A) = (x ∈ A)"*
by *auto*

lemma *Pan_image_eq [simp]: "(Pan x ∈ Pan‘A) = (x ∈ A)"*
by *auto*

lemma *Pan_Key_image_eq [simp]: "(Pan x ∉ Key‘A)"*
by *auto*

lemma *Nonce_Pan_image_eq [simp]: "(Nonce x ∉ Pan‘A)"*
by *auto*

lemma *invKey_eq [simp]: "(invKey K = invKey K') = (K=K')"*
apply *safe*
apply *(drule_tac f = invKey* **in** *arg_cong, simp)*
done

1.2 keysFor operator

lemma *keysFor_empty [simp]: "keysFor {} = {}"*
by *(unfold keysFor_def, blast)*

lemma *keysFor_Un [simp]: "keysFor (H ∪ H') = keysFor H ∪ keysFor H'"*
by *(unfold keysFor_def, blast)*

lemma *keysFor_UN [simp]: "keysFor (⋃i∈A. H i) = (⋃i∈A. keysFor (H i))"*
by *(unfold keysFor_def, blast)*

lemma *keysFor_mono: "G⊆H ==> keysFor(G) ⊆ keysFor(H)"*
by *(unfold keysFor_def, blast)*

lemma *keysFor_insert_Agent [simp]: "keysFor (insert (Agent A) H) = keysFor H"*
by *(unfold keysFor_def, auto)*

lemma *keysFor_insert_Nonce [simp]: "keysFor (insert (Nonce N) H) = keysFor H"*
by *(unfold keysFor_def, auto)*

lemma *keysFor_insert_Number [simp]: "keysFor (insert (Number N) H) = keysFor H"*
by *(unfold keysFor_def, auto)*

lemma *keysFor_insert_Key [simp]: "keysFor (insert (Key K) H) = keysFor H"*
by *(unfold keysFor_def, auto)*

lemma *keysFor_insert_Pan [simp]: "keysFor (insert (Pan A) H) = keysFor H"*
by *(unfold keysFor_def, auto)*

lemma *keysFor_insert_Hash [simp]: "keysFor (insert (Hash X) H) = keysFor H"*
by *(unfold keysFor_def, auto)*

lemma *keysFor_insert_MPair [simp]: "keysFor (insert {|X,Y|} H) = keysFor H"*
by *(unfold keysFor_def, auto)*

lemma *keysFor_insert_Crypt [simp]:*
"keysFor (insert (Crypt K X) H) = insert (invKey K) (keysFor H)"
by *(unfold keysFor_def, auto)*

lemma *keysFor_image_Key [simp]: "keysFor (Key`E) = {}"*
by *(unfold keysFor_def, auto)*

lemma *Crypt_imp_invKey_keysFor: "Crypt K X ∈ H ==> invKey K ∈ keysFor H"*
by *(unfold keysFor_def, blast)*

1.3 Inductive relation "parts"

lemma *MPair_parts:*
"[| {|X,Y|} ∈ parts H;
[| X ∈ parts H; Y ∈ parts H |] ==> P |] ==> P"
by *(blast dest: parts.Fst parts.Snd)*

declare *MPair_parts [elim!] parts.Body [dest!]*

NB These two rules are UNSAFE in the formal sense, as they discard the compound message. They work well on THIS FILE. *MPair_parts* is left as SAFE because it speeds up proofs. The Crypt rule is normally kept UNSAFE to avoid breaking up certificates.

lemma *parts_increasing: "H ⊆ parts(H)"*
by *blast*

lemmas *parts_insertI = subset_insertI [THEN parts_mono, THEN subsetD]*

lemma *parts_empty [simp]: "parts{} = {}"*
apply *safe*
apply *(erule parts.induct, blast+)*
done

lemma *parts_emptyE [elim!]: "X∈ parts{} ==> P"*
by *simp*

lemma *parts_singleton: "X∈ parts H ==> ∃Y∈H. X∈ parts {Y}"*
by *(erule parts.induct, fast+)*

1.3.1 Unions

lemma *parts_Un_subset1: "parts(G) ∪ parts(H) ⊆ parts(G ∪ H)"*
by *(intro Un_least parts_mono Un_upper1 Un_upper2)*

lemma *parts_Un_subset2: "parts(G ∪ H) ⊆ parts(G) ∪ parts(H)"*
apply *(rule subsetI)*
apply *(erule parts.induct, blast+)*
done

lemma *parts_Un [simp]: "parts(G ∪ H) = parts(G) ∪ parts(H)"*
by *(intro equalityI parts_Un_subset1 parts_Un_subset2)*

lemma *parts_insert: "parts (insert X H) = parts {X} ∪ parts H"*
apply *(subst insert_is_Un [of _ H])*
apply *(simp only: parts_Un)*
done

lemma *parts_insert2:*
"parts (insert X (insert Y H)) = parts {X} ∪ parts {Y} ∪ parts H"
apply *(simp add: Un_assoc)*
apply *(simp add: parts_insert [symmetric])*
done

This allows *blast* to simplify occurrences of *parts (G ∪ H)* in the assumption.

declare *parts_Un [THEN equalityD1, THEN subsetD, THEN UnE, elim!]*

lemma *parts_insert_subset: "insert X (parts H) ⊆ parts(insert X H)"*
by *(blast intro: parts_mono [THEN [2] rev_subsetD])*

1.3.2 Idempotence and transitivity

lemma *parts_partsD [dest!]: "X∈ parts (parts H) ==> X∈ parts H"*
by *(erule parts.induct, blast+)*

lemma *parts_idem [simp]: "parts (parts H) = parts H"*
by *blast*

lemma *parts_trans: "[| X∈ parts G; G ⊆ parts H |] ==> X∈ parts H"*
by *(drule parts_mono, blast)*

lemma *parts_cut:*
"[| Y∈ parts (insert X G); X∈ parts H |] ==> Y∈ parts (G ∪ H)"
by *(erule parts_trans, auto)*

lemma *parts_cut_eq [simp]: "X∈ parts H ==> parts (insert X H) = parts H"*
by *(force dest!: parts_cut intro: parts_insertI)*

1.3.3 Rewrite rules for pulling out atomic messages

lemmas *parts_insert_eq_I = equalityI [OF subsetI parts_insert_subset]*

lemma *parts_insert_Agent [simp]:*
```
     "parts (insert (Agent agt) H) = insert (Agent agt) (parts H)"

ctxt)))›
    "for proving theorems of the form X ∉ analz (knows Spy evs) ⟶ P"
```

end

3 The Public-Key Theory, Modified for SET

theory *Public_SET*
imports *Event_SET*
begin

3.1 Symmetric and Asymmetric Keys

definitions influenced by the wish to assign asymmetric keys - since the beginning - only to RCA and CAs, namely we need a partial function on type Agent

The SET specs mention two signature keys for CAs - we only have one

consts
  publicKey :: "[bool, agent] ⇒ key"
    — the boolean is TRUE if a signing key

abbreviation *"pubEK == publicKey False"*
abbreviation *"pubSK == publicKey True"*

abbreviation *"priEK A == invKey (pubEK A)"*
abbreviation *"priSK A == invKey (pubSK A)"*

By freeness of agents, no two agents have the same key. Since *True* ≠ *False*, no agent has the same signing and encryption keys.

specification *(publicKey)*
  injective_publicKey:
    "publicKey b A = publicKey c A' ⟹ b=c ∧ A=A'"
axiomatization where

  privateKey_neq_publicKey [iff]:
      "invKey (publicKey b A) ≠ publicKey b' A'"

declare *privateKey_neq_publicKey [THEN not_sym, iff]*

3.2 Initial Knowledge

This information is not necessary. Each protocol distributes any needed certificates, and anyway our proofs require a formalization of the Spy's knowledge only. However, the initial knowledge is as follows: All agents know RCA's public keys; RCA and CAs know their own respective keys; RCA (has already certified and therefore) knows all CAs public keys; Spy knows all keys of all bad agents.

overloading *initState ≡ "initState"*
begin

```
primrec initState where| initState_Spy:
    "initState Spy = Key ‘ (invKey ‘ pubEK ‘ bad ∪
                            invKey ‘ pubSK ‘ bad ∪
                            range pubEK ∪ range pubSK)"

end
```

Injective mapping from agents to PANs: an agent can have only one card

```
consts  pan :: "agent ⇒ nat"

specification (pan)
  inj_pan: "inj pan"
  — No two agents have the same PAN
declare inj_pan [THEN inj_eq, iff]

consts
  XOR :: "nat*nat ⇒ nat"  — no properties are assumed of exclusive-or
```

3.3 Signature Primitives

definition

```
  sign :: "[key, msg]⇒msg"
  where "sign K X = {|X, Crypt K (Hash X) |}"
```

definition

```
  signOnly :: "[key, msg]⇒msg"
  where "signOnly K X = Crypt K (Hash X)"
```

definition

```
  signCert :: "[key, msg]⇒msg"
  where "signCert K X = {|X, Crypt K X |}"
```

definition

```
  cert :: "[agent, key, msg, key] ⇒ msg"
  where "cert A Ka T signK = signCert signK {|Agent A, Key Ka, T|}"
```

definition

```
  certC :: "[nat, key, nat, msg, key] ⇒ msg"
  where "certC PAN Ka PS T signK =
    signCert signK {|Hash {|Nonce PS, Pan PAN|}, Key Ka, T|}"

abbreviation "onlyEnc == Number 0"
abbreviation "onlySig == Number (Suc 0)"
abbreviation "authCode == Number (Suc (Suc 0))"
```

3.4 Encryption Primitives

definition *EXcrypt :: "[key,key,msg,msg] ⇒ msg"* **where**
— Extra Encryption

```
"EXcrypt K EK M m =
   {|Crypt K {|M, Hash m|}, Crypt EK {|Key K, m|}|}"
```

definition *EXHcrypt :: "[key,key,msg,msg] ⇒ msg"* **where**
— Extra Encryption with Hashing

```
"EXHcrypt K EK M m =
   {|Crypt K {|M, Hash m|}, Crypt EK {|Key K, m, Hash M|}|}"
```

definition *Enc :: "[key,key,key,msg] ⇒ msg"* **where**
— Simple Encapsulation with SIGNATURE

```
"Enc SK K EK M =
   {|Crypt K (sign SK M), Crypt EK (Key K)|}"
```

definition *EncB :: "[key,key,key,msg,msg] ⇒ msg"* **where**
— Encapsulation with Baggage. Keys as above, and baggage b.

```
"EncB SK K EK M b =
   {|Enc SK K EK {|M, Hash b|}, b|}"
```

3.8 Specialized Methods for Possibility Theorems

ML

```
ML‹
(*Tactic for possibility theorems*)
fun possibility_tac ctxt =
    REPEAT (*omit used_Says so that Nonces start from different traces!*)
    (ALLGOALS (simp_tac (ctxt delsimps [@{thm used_Says}, @{thm used_Notes}]))
     THEN
     REPEAT_FIRST (eq_assume_tac ORELSE'
                   resolve_tac ctxt [refl, conjI, @{thm Nonce_supply}]))

(*For harder protocols (such as SET_CR!), where we have to set up some
  nonces and keys initially*)
fun basic_possibility_tac ctxt =
    REPEAT
    (ALLGOALS (asm_simp_tac (ctxt setSolver safe_solver))
     THEN
     REPEAT_FIRST (resolve_tac ctxt [refl, conjI]))
›

method_setup possibility = ‹
    Scan.succeed (SIMPLE_METHOD o possibility_tac)›
    "for proving possibility theorems"

method_setup basic_possibility = ‹
    Scan.succeed (SIMPLE_METHOD o basic_possibility_tac)›
    "for proving possibility theorems"
```

3.9 Specialized Rewriting for Theorems About `analz` and Image

```
lemma insert_Key_singleton: "insert (Key K) H = Key ‘ {K} ∪ H"
by blast

lemma insert_Key_image:
     "insert (Key K) (Key‘KK ∪ C) = Key ‘ (insert K KK) ∪ C"
by blast
```

Needed for *DK_fresh_not_KeyCryptKey*

```
lemma publicKey_in_used [iff]: "Key (publicKey b A) ∈ used evs"
by auto

lemma privateKey_in_used [iff]: "Key (invKey (publicKey b A)) ∈ used evs"
by (blast intro!: initState_into_used)
```

Reverse the normal simplification of "image" to build up (not break down) the set of keys. Based on *analz_image_freshK_ss*, but simpler.

```
lemmas analz_image_keys_simps =
       simp_thms mem_simps — these two allow its use with only:
       image_insert [THEN sym] image_Un [THEN sym]
       rangeI symKeys_neq_imp_neq
       insert_Key_singleton insert_Key_image Un_assoc [THEN sym]
```

3.10 Controlled Unfolding of Abbreviations

A set is expanded only if a relation is applied to it

lemma *def_abbrev_simp_relation:*
```
"A = B ⟹ (A ∈ X) = (B ∈ X) ∧
          (u = A) = (u = B) ∧
          (A = u) = (B = u)"
```
by *auto*

A set is expanded only if one of the given functions is applied to it

lemma *def_abbrev_simp_function:*
```
"A = B
 ⟹ parts (insert A X) = parts (insert B X) ∧
    analz (insert A X) = analz (insert B X) ∧
    keysFor (insert A X) = keysFor (insert B X)"
```
by *auto*

3.10.1 Special Simplification Rules for *signCert*

Avoids duplicating X and its components!

lemma *parts_insert_signCert:*
```
"parts (insert (signCert K X) H) =
 insert {|X, Crypt K X|} (parts (insert (Crypt K X) H))"
```
by *(simp add: signCert_def insert_commute [of X])*

Avoids a case split! [X is always available]

lemma *analz_insert_signCert:*
```
"analz (insert (signCert K X) H) =
 insert {|X, Crypt K X|} (insert (Crypt K X) (analz (insert X H)))"
```
by *(simp add: signCert_def insert_commute [of X])*

lemma *keysFor_insert_signCert: "keysFor (insert (signCert K X) H) = keysFor H"*
by *(simp add: signCert_def)*

Controlled rewrite rules for *signCert*, just the definitions of the others. Encryption primitives are just expanded, despite their huge redundancy!

lemmas *abbrev_simps [simp] =*
```
    parts_insert_signCert analz_insert_signCert keysFor_insert_signCert

```
by *(auto dest: analz_into_parts)*

end

4 The SET Cardholder Registration Protocol

theory *Cardholder_Registration*
imports *Public_SET*
begin

Note: nonces seem to consist of 20 bytes. That includes both freshness challenges (Chall-EE, etc.) and important secrets (CardSecret, PANsecret)

Simplifications involving *analz_image_keys_simps* appear to have become much slower. The cause is unclear. However, there is a big blow-up and the rewriting is very sensitive to the set of rewrite rules given.

4.1 Predicate Formalizing the Encryption Association between Keys

primrec *KeyCryptKey :: "[key, key, event list] ⇒ bool"*
where
```
  KeyCryptKey_Nil:
    "KeyCryptKey DK K [] = False"
| KeyCryptKey_Cons:
```
— Says is the only important case. 1st case: CR5, where KC3 encrypts KC2. 2nd case: any use of priEK C. Revision 1.12 has a more complicated version with separate treatment of the dependency of KC1, KC2 and KC3 on priEK (CA i.) Not needed since priEK C is never sent (and so can't be lost except at the start).
```
    "KeyCryptKey DK K (ev # evs) =
     (KeyCryptKey DK K evs |
      (case ev of
        Says A B Z ⇒
         ((∃N X Y. A ≠ Spy ∧
                DK ∈ symKeys ∧
                Z = {|Crypt DK {|Agent A, Nonce N, Key K, X|}, Y|}) |
          (∃C. DK = priEK C))
       | Gets A' X ⇒ False
       | Notes A' X ⇒ False))"
```

4.2 Predicate formalizing the association between keys and nonces

```
primrec KeyCryptNonce :: "[key, key, event list] ⇒ bool"
where
  KeyCryptNonce_Nil:
    "KeyCryptNonce EK K [] = False"
| KeyCryptNonce_Cons:
```

— Says is the only important case. 1st case: CR3, where KC1 encrypts NC2 (distinct from CR5 due to EXH); 2nd case: CR5, where KC3 encrypts NC3; 3rd case: CR6, where KC2 encrypts NC3; 4th case: CR6, where KC2 encrypts NonceCCA; 5th case: any use of `priEK C` (including CardSecret). NB the only Nonces we need to keep secret are CardSecret and NonceCCA. But we can't prove `Nonce_compromise` unless the relation covers ALL nonces that the protocol keeps secret.

```
  "KeyCryptNonce DK N (ev # evs) =
   (KeyCryptNonce DK N evs |
    (case ev of
      Says A B Z ⇒
       A ≠ Spy ∧
       ((∃X Y. DK ∈ symKeys ∧
               Z = (EXHcrypt DK X {|Agent A, Nonce N|} Y)) |
        (∃X Y. DK ∈ symKeys ∧
               Z = {|Crypt DK {|Agent A, Nonce N, X|}, Y|}) |
        (∃K i X Y.
          K ∈ symKeys ∧
          Z = Crypt K {|sign (priSK (CA i)) {|Agent B, Nonce N, X|}, Y|} ∧
          (DK=K | KeyCryptKey DK K evs)) |
        (∃K C NC3 Y.
          K ∈ symKeys ∧
          Z = Crypt K
                {|sign (priSK C) {|Agent B, Nonce NC3, Agent C, Nonce N|},
                  Y|} ∧
          (DK=K | KeyCryptKey DK K evs)) |
        (∃C. DK = priEK C))
    | Gets A' X ⇒ False
    | Notes A' X ⇒ False))"
```

4.3 Formal protocol definition

```
inductive_set
  set_cr :: "event list set"
where
```

```
  Nil:
```

— Initial trace is empty

```
        "[] ∈ set_cr"
```

```
| Fake:
```

— The spy MAY say anything he CAN say.

```
         "[| evsf ∈ set_cr; X ∈ synth (analz (knows Spy evsf)) |]
          ==> Says Spy B X  # evsf ∈ set_cr"
```

```
| Reception:
```

— If A sends a message X to B, then B might receive it

```
            "[| evsr ∈ set_cr; Says A B X ∈ set evsr |]
             ==> Gets B X  # evsr ∈ set_cr"
```

```
| SET_CR1: — CardCInitReq: C initiates a run, sending a nonce to CCA
            "[| evs1 ∈ set_cr;  C = Cardholder k;  Nonce NC1 ∉ used evs1
|]
             ==> Says C (CA i) {|Agent C, Nonce NC1|} # evs1 ∈ set_cr"

| SET_CR2: — CardCInitRes: CA responds sending NC1 and its certificates
            "[| evs2 ∈ set_cr;
                Gets (CA i) {|Agent C, Nonce NC1|} ∈ set evs2 |]
             ==> Says (CA i) C
                      {|sign (priSK (CA i)) {|Agent C, Nonce NC1|},
                        cert (CA i) (pubEK (CA i)) onlyEnc (priSK RCA),
                        cert (CA i) (pubSK (CA i)) onlySig (priSK RCA)|}
                   # evs2 ∈ set_cr"

| SET_CR3:
```

— RegFormReq: C sends his PAN and a new nonce to CA. C verifies that - nonce received is the same as that sent; - certificates are signed by RCA; - certificates are an encryption certificate (flag is onlyEnc) and a signature certificate (flag is onlySig); - certificates pertain to the CA that C contacted (this is done by checking the signature). C generates a fresh symmetric key KC1. The point of encrypting `{|Agent C, Nonce NC2, Hash (Pan (pan C))|}` is not clear.

```
"[| evs3 ∈ set_cr;  C = Cardholder k;
    Nonce NC2 ∉ used evs3;
    Key KC1 ∉ used evs3; KC1 ∈ symKeys;
    Gets C {|sign (invKey SKi) {|Agent X, Nonce NC1|},
              cert (CA i) EKi onlyEnc (priSK RCA),
              cert (CA i) SKi onlySig (priSK RCA)|}
       ∈ set evs3;
    Says C (CA i) {|Agent C, Nonce NC1|} ∈ set evs3|]
 ==> Says C (CA i) (EXHcrypt KC1 EKi {|Agent C, Nonce NC2|} (Pan(pan C)))
       # Notes C {|Key KC1, Agent (CA i)|}
       # evs3 ∈ set_cr"

| SET_CR4:
```

— RegFormRes: CA responds sending NC2 back with a new nonce NCA, after checking that - the digital envelope is correctly encrypted by `pubEK (CA i)` - the entire message is encrypted with the same key found inside the envelope (here, KC1)

```
"[| evs4 ∈ set_cr;
    Nonce NCA ∉ used evs4;  KC1 ∈ symKeys;
    Gets (CA i) (EXHcrypt KC1 EKi {|Agent C, Nonce NC2|} (Pan(pan X)))
       ∈ set evs4 |]
  ==> Says (CA i) C
          {|sign (priSK (CA i)) {|Agent C, Nonce NC2, Nonce NCA|},
            cert (CA i) (pubEK (CA i)) onlyEnc (priSK RCA),
            cert (CA i) (pubSK (CA i)) onlySig (priSK RCA)|}
       # evs4 ∈ set_cr"

| SET_CR5:
```

— CertReq: C sends his PAN, a new nonce, its proposed public signature key and its half of the secret value to CA. We now assume that C has a fixed key pair, and he submits (pubSK C). The protocol does not require this key to be fresh. The encryption below is actually EncX.

```
"[| evs5 ∈ set_cr;  C = Cardholder k;
    Nonce NC3 ∉ used evs5;  Nonce CardSecret ∉ used evs5; NC3≠CardSecret;
```

```
    Key KC2 ∉ used evs5; KC2 ∈ symKeys;
    Key KC3 ∉ used evs5; KC3 ∈ symKeys; KC2≠KC3;
    Gets C {|sign (invKey SKi) {|Agent C, Nonce NC2, Nonce NCA|},
             cert (CA i) EKi onlyEnc (priSK RCA),
             cert (CA i) SKi onlySig (priSK RCA) |}
        ∈ set evs5;
    Says C (CA i) (EXHcrypt KC1 EKi {|Agent C, Nonce NC2|} (Pan(pan C)))
         ∈ set evs5 |]
==> Says C (CA i)
         {|Crypt KC3
             {|Agent C, Nonce NC3, Key KC2, Key (pubSK C),
               Crypt (priSK C)
                 (Hash {|Agent C, Nonce NC3, Key KC2,
                         Key (pubSK C), Pan (pan C), Nonce CardSecret|})|},
           Crypt EKi {|Key KC3, Pan (pan C), Nonce CardSecret|} |}
    # Notes C {|Key KC2, Agent (CA i)|}
    # Notes C {|Key KC3, Agent (CA i)|}
    # evs5 ∈ set_cr"
```

— CertRes: CA responds sending NC3 back with its half of the secret value, its signature certificate and the new cardholder signature certificate. CA checks to have never certified the key proposed by C. NOTE: In Merchant Registration, the corresponding rule (4) uses the "sign" primitive. The encryption below is actually *EncK*, which is just *Crypt K (sign SK X)*.

```
| SET_CR6:
"[| evs6 ∈ set_cr;

done

Unicity of cardSK: it uniquely identifies the other components. This holds because a CA accepts a cardSK at most once.

lemma *cardholder_key_unicity:*
```
     "[|Says (CA i) C (Crypt KC2
          {|sign (priSK (CA i)) {|Agent C, Nonce NC3, Agent (CA i), Nonce Y|},
            certC (pan C) cardSK X onlySig (priSK (CA i)),
```

```
            cert (CA i) (pubSK (CA i)) onlySig (priSK RCA)⦈)
          ∈ set evs;
        Says (CA i) C' (Crypt KC2'
          {|sign (priSK (CA i)) {|Agent C', Nonce NC3', Agent (CA i), Nonce
Y'|},
            certC (pan C') cardSK X' onlySig (priSK (CA i)),
            cert (CA i) (pubSK (CA i)) onlySig (priSK RCA)⦈)
          ∈ set evs;
        evs ∈ set_cr |] ==> C=C' ∧ NC3=NC3' ∧ X=X' ∧ KC2=KC2' ∧ Y=Y'"
apply (erule rev_mp)
apply (erule rev_mp)
apply (erule set_cr.induct)
apply (simp_all (no_asm_simp))
apply (blast dest!: CR6_Says_imp_Notes)
done
```

Cannot show cardSK to be secret because it isn't assumed to be fresh it could be a previously compromised cardSK [e.g. involving a bad CA]

end

5 The SET Merchant Registration Protocol

theory *Merchant_Registration*
imports *Public_SET*
begin

Copmpared with Cardholder Reigstration, *KeyCryptKey* is not needed: no session key encrypts another. Instead we prove the "key compromise" theorems for sets KK that contain no private encryption keys (*priEK C*).

inductive_set
  set_mr :: "event list set"
where

```
  Nil:      — Initial trace is empty
           "[] ∈ set_mr"

| Fake:     — The spy MAY say anything he CAN say.
           "[| evsf ∈ set_mr; X ∈ synth (analz (knows Spy evsf)) |]
            ==> Says Spy B X  # evsf ∈ set_mr"

| Reception: — If A sends a message X to B, then B might receive it
            "[| evsr ∈ set_mr; Says A B X ∈ set evsr |]
             ==> Gets B X  # evsr ∈ set_mr"

```

The two certificates - for merSK and for merEK - cannot be proved to have originated together

end

6 Purchase Phase of SET

theory *Purchase*
imports *Public_SET*

begin

Note: nonces seem to consist of 20 bytes. That includes both freshness challenges (Chall-EE, etc.) and important secrets (CardSecret, PANsecret)

This version omits *LID_C* but retains *LID_M*. At first glance (Programmer's Guide page 267) it seems that both numbers are just introduced for the respective convenience of the Cardholder's and Merchant's system. However, omitting both of them would create a problem of identification: how can the Merchant's system know what transaction is it supposed to process?

Further reading (Programmer's guide page 309) suggest that there is an outside bootstrapping message (SET initiation message) which is used by the Merchant and the Cardholder to agree on the actual transaction. This bootstrapping message is described in the SET External Interface Guide and ought to generate *LID_M*. According SET Extern Interface Guide, this number might be a cookie, an invoice number etc. The Programmer's Guide on page 310, states that in absence of *LID_M* the protocol must somehow ("outside SET") identify the transaction from OrderDesc, which is assumed to be a searchable text only field. Thus, it is assumed that the Merchant or the Cardholder somehow agreed out-of-bad on the value of *LID_M* (for instance a cookie in a web transaction etc.). This out-of-band agreement is expressed with a preliminary start action in which the merchant and the Cardholder agree on the appropriate values. Agreed values are stored with a suitable notes action.

"XID is a transaction ID that is usually generated by the Merchant system, unless there is no PInitRes, in which case it is generated by the Cardholder system. It is a randomly generated 20 byte variable that is globally unique (statistically). Merchant and Cardholder systems shall use appropriate random number generators to ensure the global uniqueness of XID." –Programmer's Guide, page 267.

PI (Payment Instruction) is the most central and sensitive data structure in SET. It is used to pass the data required to authorize a payment card payment from the Cardholder to the Payment Gateway, which will use the data to initiate a payment card transaction through the traditional payment card financial network. The data is encrypted by the Cardholder and sent via the Merchant, such that the data is hidden from the Merchant unless the Acquirer passes the data back to the Merchant. –Programmer's Guide, page 271.

consts

CardSecret :: "nat ⇒ nat"
— Maps Cardholders to CardSecrets. A CardSecret of 0 means no cerificate, must use unsigned format.

PANSecret :: "nat ⇒ nat"
— Maps Cardholders to PANSecrets.

When M receives AuthRes, he knows that P signed it, including the identifying tags and the purchase amount, which he can verify. (Although the spec has SIGNED and UNSIGNED forms of AuthRes, they send the same message to M.) The conclusion is weak: M is existentially quantified! That is because Authorization Response does not refer to M, while the digital envelope weakens the link between *MsgAuthRes* and *priSK M*. Changing the precondition to refer to *Crypt K (sign SK M)* requires assuming *K* to be secure, since otherwise the Spy could create that message.

```
theorem M_verifies_AuthRes:

When P receives an AuthReq and a dual signature, he knows that C and M agree on the essential details. PurchAmt however is never sent by M to P; instead C and M both send *HOD = Hash {|Number OrderDesc, Number PurchAmt|}* and P compares the two copies of HOD.

Agreement can't be proved for some things, including the symmetric keys used in the digital envelopes. On the other hand, M knows the true identity of PG (namely j'), and sends AReq there; he can't, however, check that the EXcrypt involves the correct PG's key.

```
