Complexity Theory

3

## Outline

A rough lecture-by-lecture guide, with relevant sections from the text by Papadimitriou (or Sipser, where marked with an S).

- Algorithms and problems. 1.1–1.3.
- Time and space. 2.1–2.5, 2.7.
- Time Complexity classes. 7.1, S7.2.
- Nondeterminism. 2.7, 9.1, S7.3.
- NP-completeness. 8.1–8.2, 9.2.
- Graph-theoretic problems. 9.3

### Texts

The main texts for the course are: Computational Complexity. Christos H. Papadimitriou. Introduction to the Theory of Computation. Michael Sipser. Other useful references include:

Computers and Intractability: A guide to the theory of NP-completeness. Michael R. Garey and David S. Johnson.

Structural Complexity. Vols I and II. J.L. Balcázar, J. Díaz and J. Gabarró. Computability and Complexity from a Programming Perspective. Neil Jones.

#### Complexity Theory

Outline - contd.

- Sets, numbers and scheduling. 9.4
- **coNP.** 10.1–10.2.
- Cryptographic complexity. 12.1–12.2.
- **Space Complexity** 7.1, 7.3, S8.1.
- Hierarchy 7.2, S9.1.
- Descriptive Complexity 5.6, 5.7.

number of steps.

Complexity Theory

solvable at all, algorithmically.

## **Algorithms and Problems**

Insertion Sort runs in time  $O(n^2)$ , while Merge Sort is an  $O(n \log n)$  algorithm.

The first half of this statement is short for:

If we count the number of steps performed by the Insertion **Sort** algorithm on an input of size n, taking the largest such number, from among all inputs of that size, then the function of n so defined is eventually bounded by a constant multiple of  $n^2$ .

It makes sense to compare the two algorithms, because they seek to solve the same problem.

But, what is the complexity of the sorting problem?

## Review

The complexity of an algorithm (whether measuring number of steps, or amount of memory) is usually described asymptotically:

### Definition

For functions  $f : \mathbb{N} \to \mathbb{N}$  and  $q : \mathbb{N} \to \mathbb{N}$ , we say that:

- f = O(q), if there is an  $n_0 \in \mathbb{N}$  and a constant c such that for all  $n > n_0$ , f(n) < cq(n);
- $f = \Omega(q)$ , if there is an  $n_0 \in \mathbb{N}$  and a constant c such that for all  $n > n_0$ ,  $f(n) \ge cg(n)$ .
- $f = \theta(q)$  if f = O(q) and  $f = \Omega(q)$ .

Usually, O is used for upper bounds and  $\Omega$  for lower bounds.

Complexity Theory

## Lower and Upper Bounds

**Complexity Theory** 

Complexity Theory seeks to understand what makes certain

In Data Structures and Algorithms, we saw how to measure the

In Computation Theory, we saw that certain problems were not

Both of these are prerequisites for the present course.

complexity of specific algorithms, by asymptotic measures of

problems algorithmically difficult to solve.

What is the running time complexity of the fastest algorithm that sorts a list?

By the analysis of the Merge Sort algorithm, we know that this is no worse than  $O(n \log n)$ .

The complexity of a particular algorithm establishes an *upper bound* on the complexity of the problem.

To establish a *lower bound*, we need to show that no possible algorithm, including those as yet undreamed of, can do better.

In the case of sorting, we can establish a lower bound of  $\Omega(n \log n)$ , showing that Merge Sort is asymptotically optimal.

Sorting is a rare example where known upper and lower bounds match.

## **Travelling Salesman**

#### Given

- V a set of nodes.
- $c: V \times V \to \mathbb{N}$  a cost matrix.

Find an ordering  $v_1, \ldots, v_n$  of V for which the total cost:

$$c(v_n, v_1) + \sum_{i=1}^{n-1} c(v_i, v_{i+1})$$

is the smallest possible.

To work for all permutations of the input list, the tree must have at least n! leaves and therefore height at least  $\log_2(n!) = \theta(n \log n)$ .

## **Complexity of TSP**

Obvious algorithm: Try all possible orderings of V and find the one with lowest cost.

The worst case running time is  $\theta(n!)$ .

Lower bound: An analysis like that for sorting shows a lower bound of  $\Omega(n \log n)$ .

Upper bound: The currently fastest known algorithm has a running time of  $O(n^2 2^n)$ .

 $a_i < a_i$  $a_i$  $a_i < a_i$  $a_i$  $a_i$ 

Lower Bound on Sorting

An algorithm A sorting a list of n distinct numbers  $a_1, \ldots, a_n$ .
