

Easter 2010

DEVELOPING COMMERCIAL SOFTWARE

Product vs. Technology

- Technology is written for the sake of the technology
 - Research
 - Prototyping
 - Platform Development
- Product is written to be sold
 - Has an identified market
 - Output is something which can be sold

The Commercial Software Team

The SQL Response 2.0 Project Team

| # | Role | Responsibility |
|---|------------------------------|--|
| 1 | Scrum Master/Project Manager | Scrum master, coordinates backlog. |
| 1 | Product Manager/Owner | Commercial input. Represents users. |
| 1 | Usability Engineer | Designs visual aspects of product. |
| 1 | Technical Author | Responsible for all text in the product. |
| 5 | Software Engineers | Architect and develop the software |
| 4 | Software Testers | Ensure the software complies with user stories |

This is just one team within Red Gate but the ratios are fairly standard.

As product and project needs change we will vary the number of people and ratios.

Stages of a Project

| Stage | Length | Output | People Involved |
|----------------------|--------------------|--------------------------|-----------------------|
| Research Phase | 1 month – 5+ years | Business case approval | PM, UX |
| Pre-greenlight | 2 weeks – 2 months | Project Approval | PM, SM, UX, Dev |
| Greenlight | 1-4 weeks | Backlog | SM, PM, UX, Dev, Test |
| Pre-EA | n Sprints | 1 st EA Build | SM, Dev, UX, Test, PM |
| EA Program | m Sprints | m EA Builds Beta 1 | SM, Dev, UX, Test, PM |
| Beta | 4-8 weeks | Release Candidate 1 | SM, Test, Dev, UX |
| Release Candidate | 2-4 weeks | Release Build | SM, Test, Dev |
| General Availability | - | - | - |
| Research Phase | 1 month – 5+ years | Business case approval | |

Product Management

- NOT the source of all ideas
- Responsible for pulling together desperate sources of information & collating into a roadmap
 - Often has P&L Responsibility for a product
- Differs from Marketing
 - Product Marketing Manager TALKS
 - Product Manager LISTENS

Research Methods

- Customer Visits
- Surveys
- Competitive Analysis
- Customer Feedback
- Support Requests
- Analyst Reports
- Partner Customer Research Reports
- Corporate Annual Statements
- Win/Loss Analysis
- Any other way of getting data on the market!

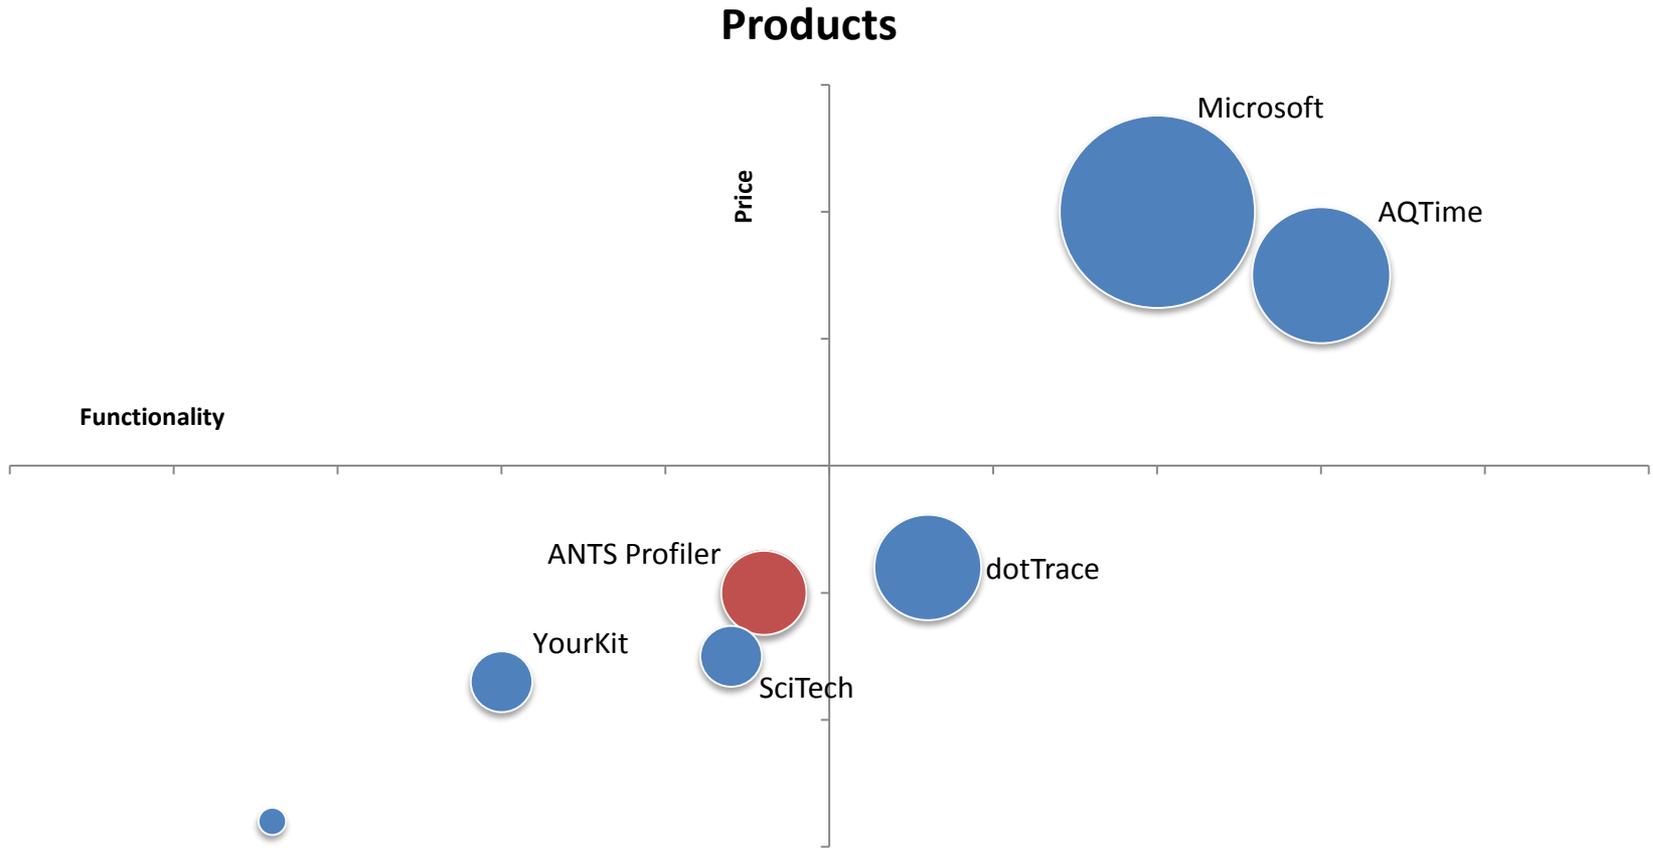

ANTS PROFILER V4

Win/Loss Analysis

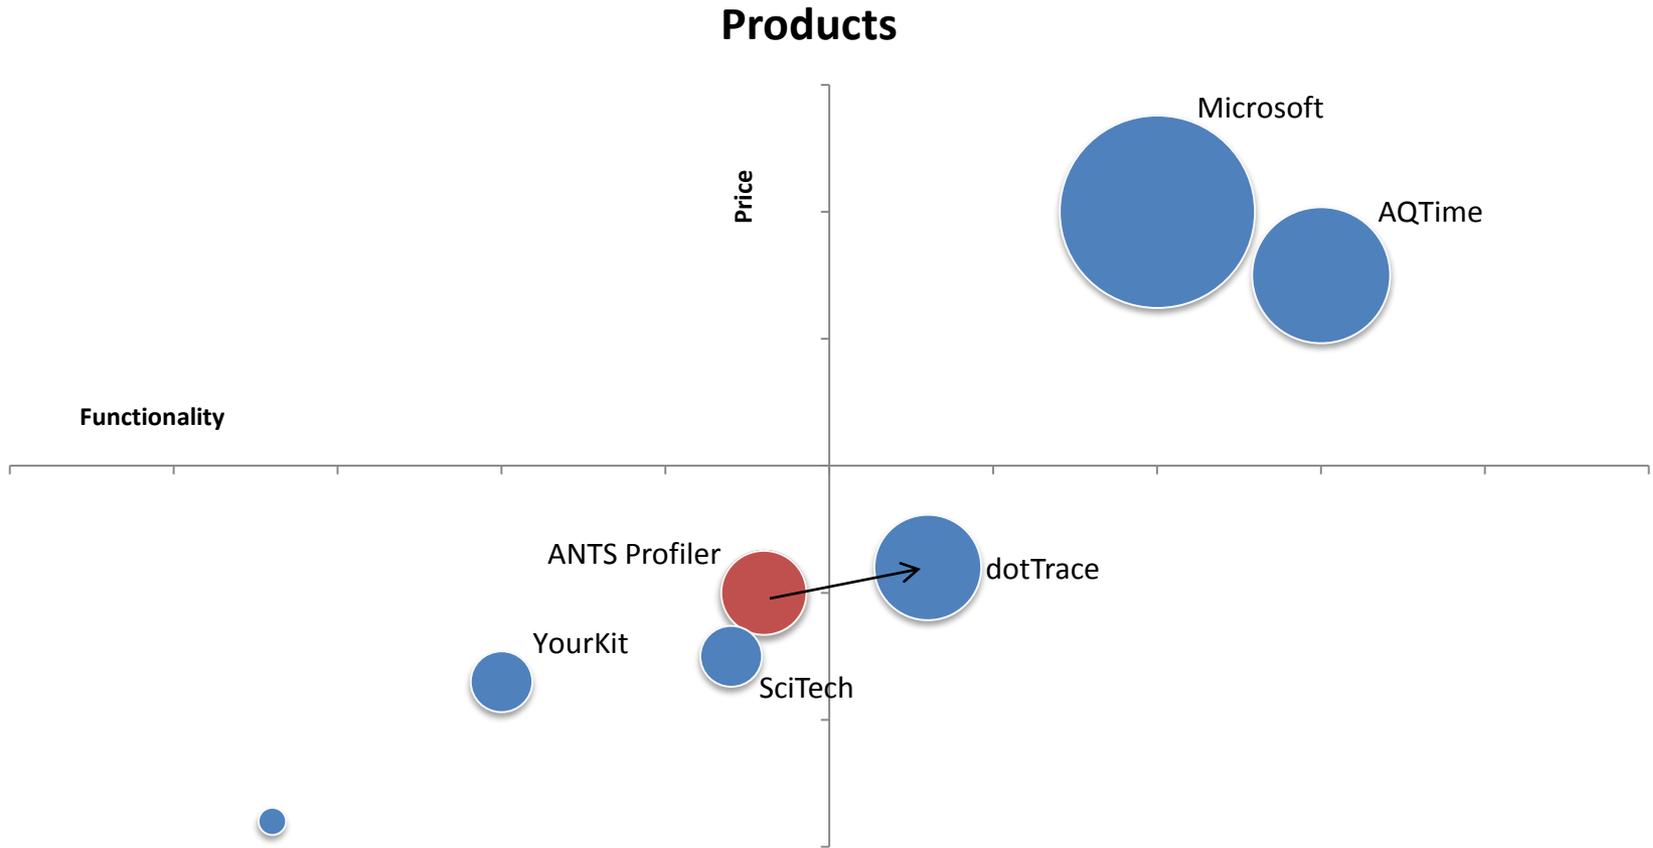

| Win | Loss (Bought competitor) | Loss (No Purchase) |
|---------------------------|---------------------------------|---------------------------|
| Ease of use | Speed | Trial solved my problem |
| Price | Ease of use | No native code support |
| Good support | Price | Too expensive |
| Used it at a previous job | Used it at a previous job | Looking to purchase soon |
| | Supported platform X | |
| | Could not get it to work | |
| | Has Attach to Process | |

n=20 *n=15* *n=45*

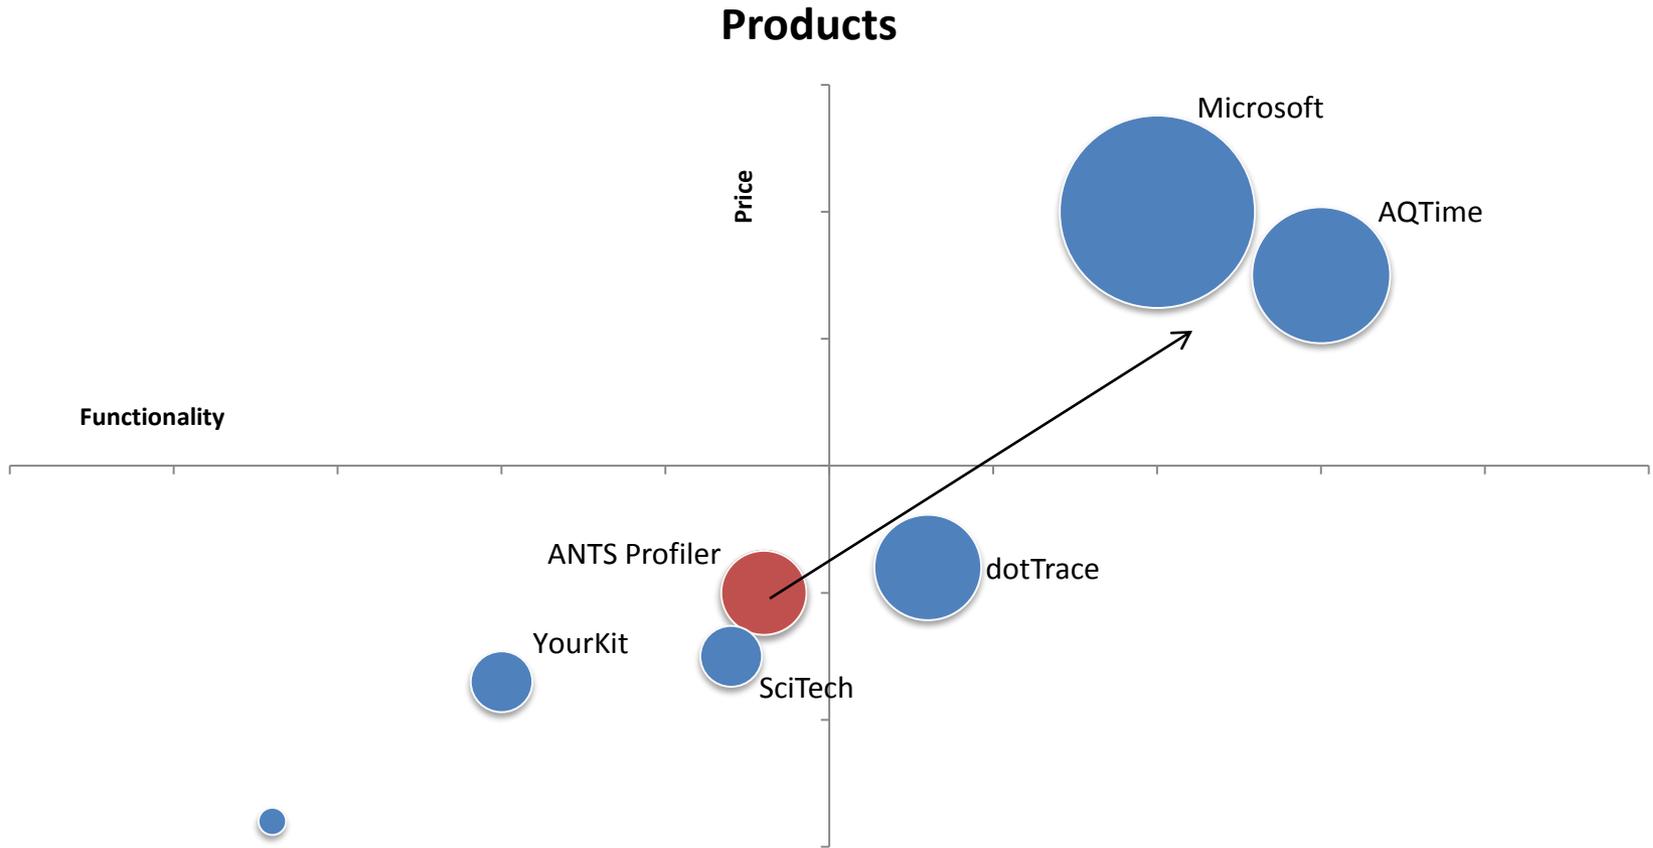

Competitive Positioning

Competitive Positioning

Competitive Positioning

Surveys

- Use to check your Hypothesis
- Cheap
- Hard to be statistically significant
 - We normally try to get 300-500 responses

ANTS Profiler v4: Key Findings

- Speed of Performance Profiler
- Attach to existing process so the user can look at part of a run
- Memory profiler could not deal with large amounts of data
- Memory Profiler overhead was too large
- Some customers preferred the competitors GUI

The Business Case

- Clear idea of what we wanted to achieve
- Is it worth doing it?
 - Need Revenue Projections
 - Need Cost Projections

Modelling the Business

- Projecting Revenue directly is tricky and error prone
- Build a simple model of the business
 - Keep it simple
 - Use numbers you can have some control over

Modelling the Business

- Downloads: Number of people trying out the tool
- Conversion Ratio: The percentage of these people who purchase the tool
- Average Transaction Value: The average spend of a customer

Revenue = Conversion Ratio x Downloads x Average Transaction Value

Average Transaction Value \propto Price

Modelling the Business

- *Use simple cost models unless something more sophisticated is needed*

$$\text{Monthly Project Cost} = \text{Number of People} \times 23 \times \$1,000$$

$$\text{Cost of Project} = \text{Monthly Project Cost} \times \text{Number of Project Months}$$

Return on Investment

- Given identical risk profiles and the following projection of cash flow should we invest Project A, Project B or neither of them?

| Year | Project A | Project B |
|------|-------------|-------------|
| 1 | (3,000,000) | (3,000,000) |
| 2 | 0 | 1,000,000 |
| 3 | 500,000 | 1,000,000 |
| 4 | 1,000,000 | 1,000,000 |
| 5 | 1,500,000 | 1,000,000 |
| 6 | 2,000,000 | 1,000,000 |

Future Value

- If you have £100 today how much is that worth in 2 years time?

$$\textit{Future Value} = \textit{Present Value} \times (1 + i)^t$$

i = Interest rate

t = Number of time periods (years)

$$\textit{Future Value} = 100 \times (1 + 0.05)^2 = 110.25$$

Discount Cash Flow/Net Present Value

- I will offer you a contract whereby I will pay you £100 in two years time. How much is that contract worth today?

$$\textit{Discounted Present Value} = \textit{Future Value} \times (1 - d)^t$$

where $d = i/(1 + i)$

$$\textit{Discounted Present Value} = 100 \times \left(1 - \left(\frac{0.05}{1 + 0.05}\right)\right)^2 = 90.70$$

Discount Cash Flow/Net Present Value

- For a cash flow:

$$\text{Net Present Value} = \sum_{t=1}^N \frac{C_t}{(1+i)^t}$$

| <i>i</i> | Project A | Project B |
|----------|-----------|-----------|
| 5% | 1,065,198 | 1,266,168 |
| 10% | 391,728 | 718,897) |

Internal Rate of Return

- For a cash flow:

$$\text{Net Present Value} = \sum_{t=1}^N \frac{C_t}{(1+i)^t}$$

- If we have costs and expected return then set NPV = 0 and solve for i

$$IRR(i) = -3,000,000 + \frac{1,000,000}{(1+i)^1} + \frac{1,000,000}{(1+i)^2} + \frac{1,000,000}{(1+i)^3} + \frac{1,000,000}{(1+i)^4} + \frac{1,000,000}{(1+i)^5} = 0$$

Internal Rate of Return

- Secants Method:

$$r_{n+1} = r_n - \frac{r_n - r_{n-1}}{IRR(r_n) - IRR(r_{n-1})} IRR(r_n)$$

- Approximate r_0 and r_1 then repeat until solution converges

| Iteration | r0 | r1 | r2 | r3 | r4 | r5 | r6 |
|-----------|--------|--------|--------|--------|--------|--------|--------|
| Project B | 25.00% | 35.00% | 18.38% | 20.28% | 19.87% | 19.86% | 19.86% |

Pitfalls with NPV, DCF and IRR

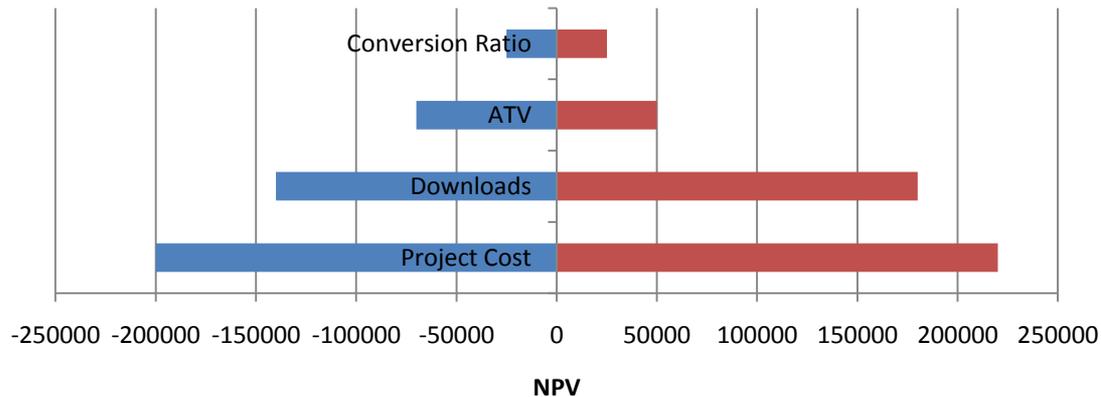

- Negative NPV projects might still be worth doing
- NPV calculations compound discount rates
 - Do not adjust for risk
- DO NOT discount known future costs
- NPV is an absolute number
 - Represents accretive value to shareholders
- IRR is expected return on capital
 - Does not include the cost of capital itself

Dealing with Uncertainty

- Lots of uncertainty in model
- Use Monte-Carlo Analysis
 - Replace single valued inputs with PDFs
 - Run the model thousands of times collecting output values
- For example:
 - Project Length: $U(9,18)$
 - Accretive Conversion Ratio: $N(0.05, 0.03)$
 - Additional Number of Leads: $U(1000,5000)$

Sensitivity Analysis

- What is the effect of each assumption?
- Use Monte-Carlo Analysis
 - Replace single valued inputs with PDFs
 - Run the model thousands of times, but only vary a single pdf, collecting output values
- Tornado chart:

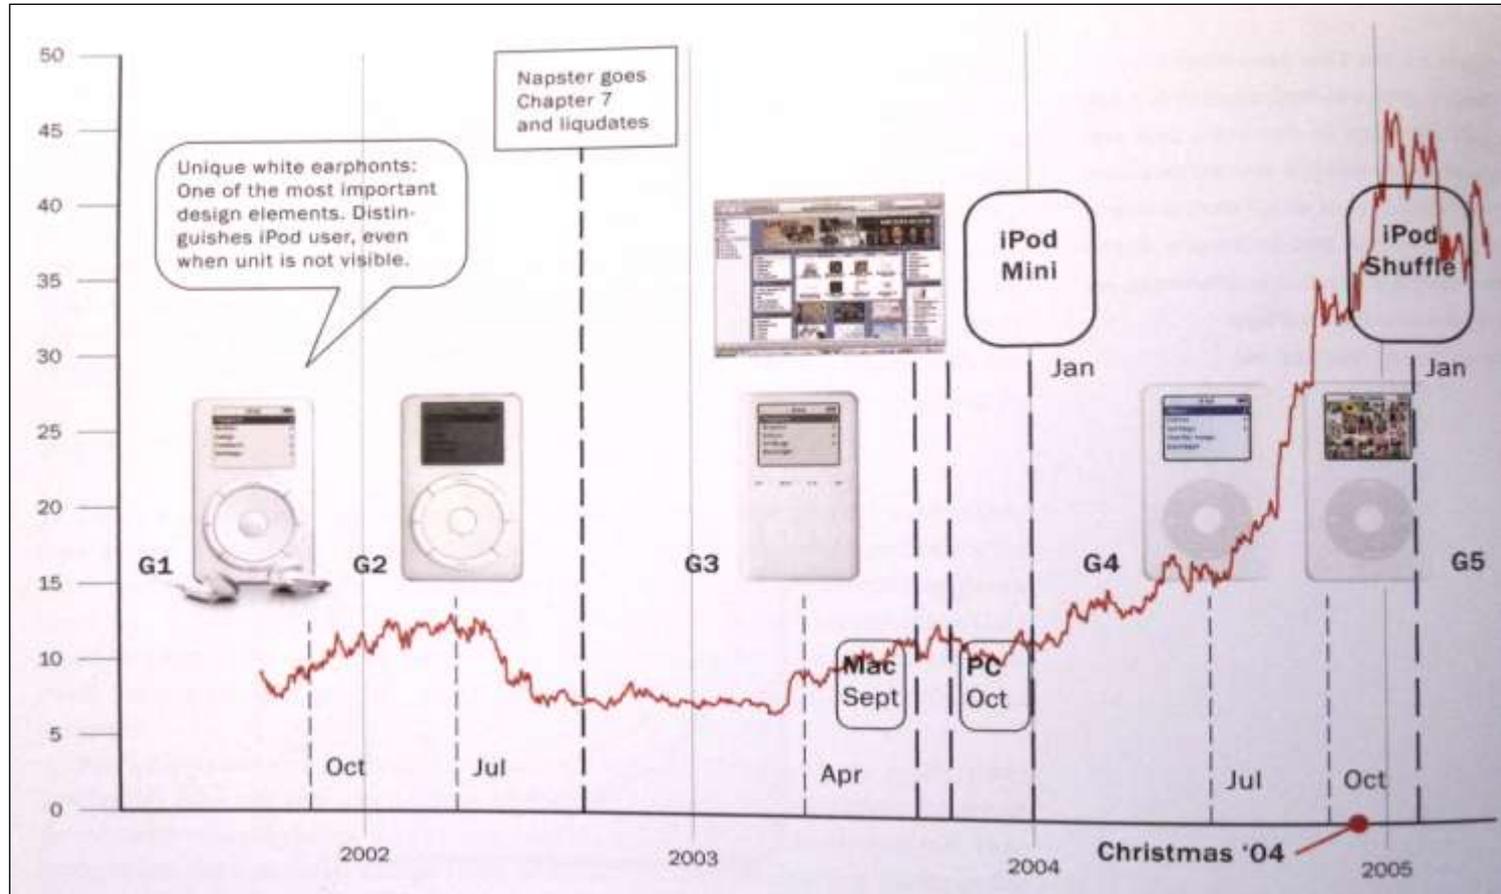

USABILITY

????

The iPod

Bill Buxton, Sketching User Experiences, p48, 2007

Improving Ease of Use

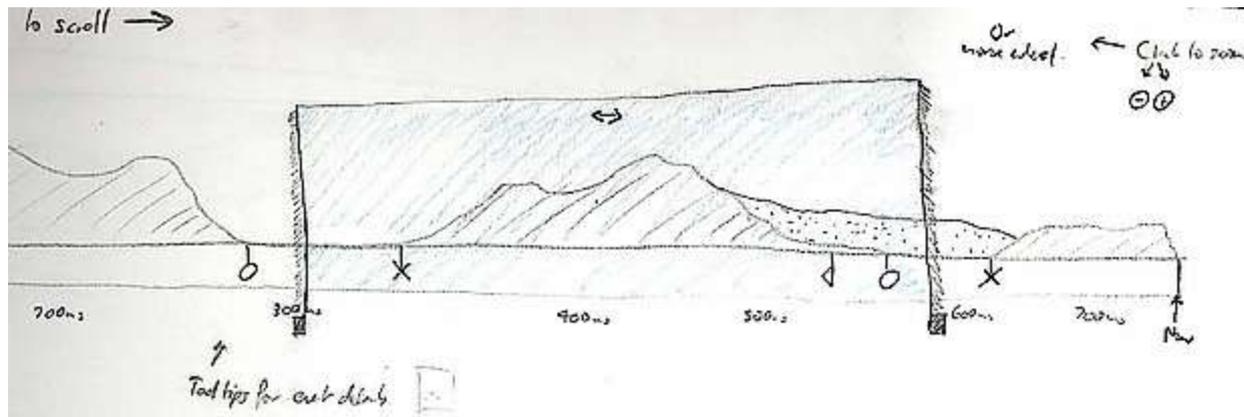

- Had idea of how to solve speed issue
- Wanted to make sure we kept all of our options open

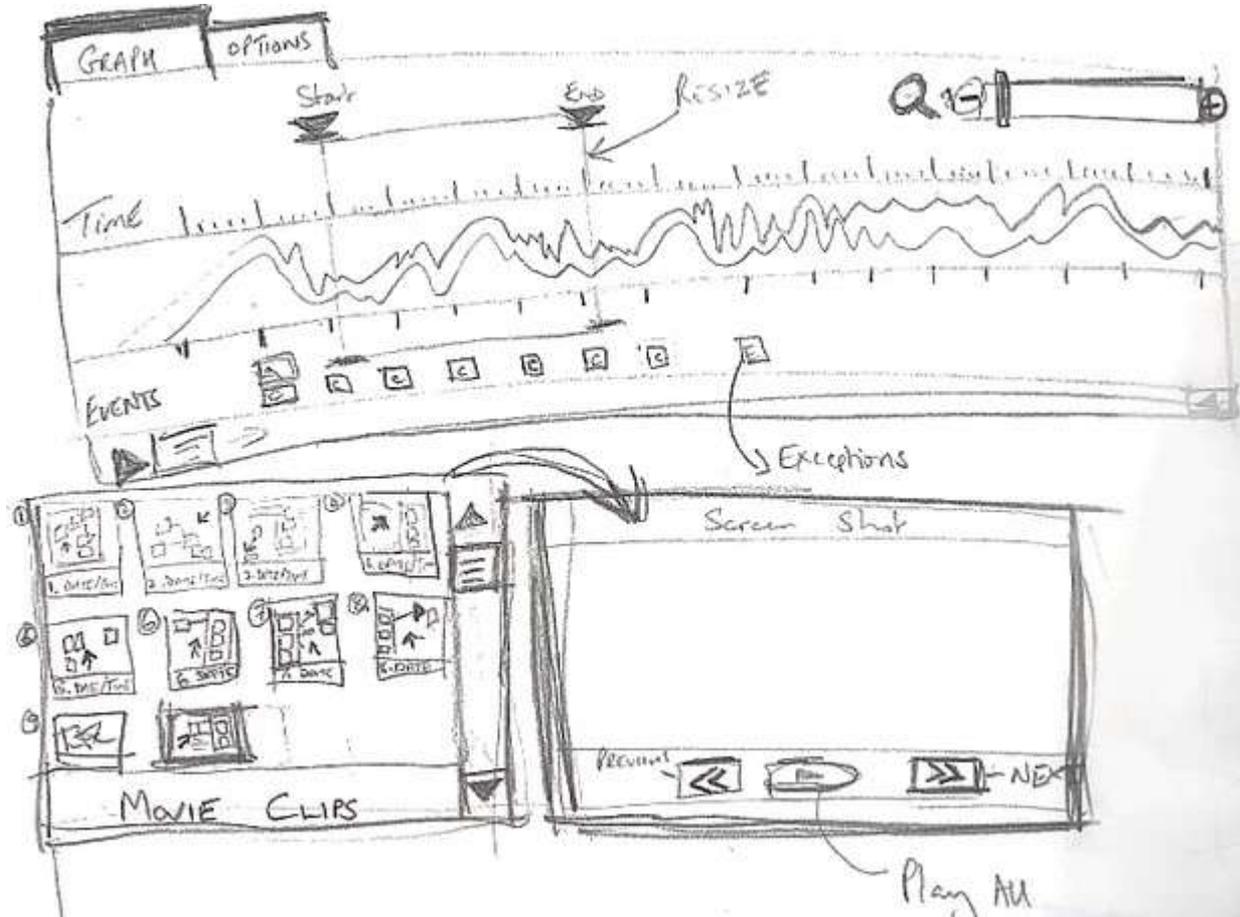

Improving Ease of Use

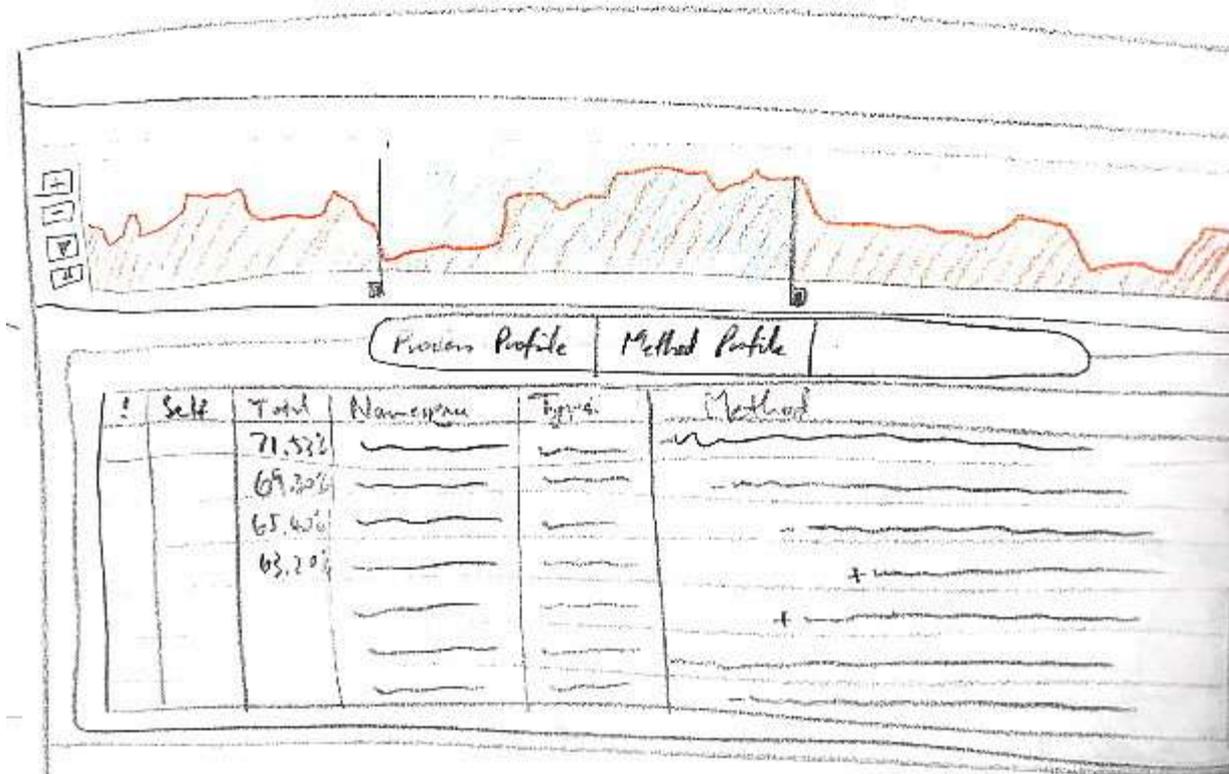

Improving Ease of Use

Running Usability Sessions

- Easy to do!
- Keep it cheap
- Explain the aims of the session to the user:
 - You are testing the software NOT the user
 - Don't always answer their questions
 - Real users don't have an expert sat next to them
- If they struggle for too long help them out with the specific issue
- If you know there is a problem help them sooner
- Remote sessions are fine

ANY QUESTIONS?
