

Usability of Programming Languages

MPhil ACS module R201 - Alan Blackwell

Overview

- ▶ Practical experimental course
 - ▶ lectures are only introductory
- ▶ Lecture 1 - theoretical principles
 - ▶ classic approaches
 - ▶ current trends in leading research.
- ▶ Lecture 2 - candidate research methods
 - ▶ advantages and disadvantages
- ▶ Lecture 3 - specific classes of user
- ▶ Lecture 4 - directed by your research interests

Reading List

- ▶ Hoc, Green, Samurçay and Gilmore (1990)
 - ▶ Psychology of Programming.
- ▶ Psychology of Programming Interest Group
 - ▶ www.ppig.org
- ▶ Cambridge guidance on human participants
- ▶ Cairns and Cox (2008)
 - ▶ Research Methods for Human-Computer Interaction
- ▶ Carroll (2003)
 - ▶ HCI Models, Theories and Frameworks: Toward a multidisciplinary science

Lecture 1: Principles of human factors in programming

Cognitive models in HCI

- ▶ Engineering model of human 'I/O subsystems' and 'central processor'
 - ▶ Derived from human factors/ergonomics
 - ▶ Speed and accuracy of movement
 - ▶ Include working memory capacity
 - ▶ 7 +/- 2 'chunks'
 - ▶ Single visual scene
- ▶ Programming as 'cognitive ergonomics'?

Cognitive models of programming

- ▶ Deciding what to do is harder than doing it
 - ▶ HCI models assume a 'correct' sequence of actions
- ▶ Classic cognitive models derived from GOFAI
 - ▶ problem solving
 - ▶ planning
 - ▶ knowledge representation
- ▶ PoP book
 - ▶ ch 1.4 - Human Cognition and Programming
 - ▶ ch 3.1 - Expert Programming Knowledge: A Schema-based Approach
 - ▶ ch 2.3 - Language Semantics, Mental Models and Analogy
 - ▶ cf user interface "metaphor"

Software Development Context

- ▶ Cognitive science: individuals in controlled contexts
 - ▶ carefully construct experimental tasks to explore schemas, plans, analogy etc
 - ▶ correspond to AI constraints of toy problems
- ▶ Compare to *wicked problems*
 - ▶ goals and criteria under-specified, constraints conflict etc
- ▶ Commercial software development is more social
 - ▶ understand problem domain, negotiate specification change
- ▶ PoP book
 - ▶ ch 1.3 - The Tasks of Programming
 - ▶ ch 3.3 - Expert Software Design Strategies
 - ▶ ch 4.1 - The Psychology of Programming in the Large: Team and Organizational Behaviour
 - ▶ cf Information Systems literature

Individual Variation

- ▶ Cognitive theories are general theories
 - ▶ Consistent aspects of human performance
- ▶ But some programmers are far more productive
 - ▶ Always more productive in a language they know
 - ▶ Performance also correlated with
 - ▶ general intelligence
 - ▶ self-efficacy
 - ▶ diagnostic tests for autism
- ▶ "expert" vs "novice"
 - ▶ Study knowledge by comparing those with to those without
 - ▶ Study naïve users who are not 'crippled' or 'mutilated'
 - ▶ Real expert performance may include design research

Major research centres and programmes

Venues

- ▶ Psychology of Programming Interest Group (PPIG)
 - ▶ annual conference - proceedings available online
 - ▶ “Work in Progress” meeting (PPIG-WIP)
- ▶ European Association for Cognitive Ergonomics (EACE)
- ▶ Empirical Studies of Programmers foundation (ESP)
- ▶ IEEE Visual Languages and Human Centric Computing
 - ▶ ESP symposia in 2002, 2003
- ▶ International conference/workshop on Program Comprehension (ICPC, formerly IWPC)
- ▶ ACM CHI
- ▶ Evaluation and Assessment in Software Engineering (EASE)

NSF EUSES

- ▶ End-Users Shaping Effective Software
 - ▶ Margaret Burnett at Oregon State University
 - ▶ Brad Myers at Carnegie Mellon University
 - ▶ Mary Beth Rosson at Penn State University
 - ▶ Susan Wiedenbeck at Drexel University
 - ▶ Gregg Rothermel at University of Nebraska
 - ▶ Alan Blackwell at Cambridge
- ▶ See brand new publication
 - ▶ Ko, A.J., Abraham, R., Beckwith, L., Blackwell, A.F., Burnett, M., Erwig, M., Lawrence, J., Lieberman, H., Myers, B., Rosson, M.-B., Rothermel, G., Scaffidi, C., Shaw, M., and Wiedenbeck, S. (2011). The State of the Art in End-User Software Engineering. ACM Computing Surveys 43(3), Article 21.

UK/European centres

- ▶ PPIG UK
 - ▶ Salford (Maria Kutar – chair)
 - ▶ York (Thomas Green)
 - ▶ Sheffield Hallam (Chris Roast)
 - ▶ Open University (Marian Petre and Judith Segal)
 - ▶ Sussex (Judith Good)
 - ▶ Cambridge (Alan Blackwell)
- ▶ Joensuu, Finland (Sajaniemi, Tukiainen, Bednarik)
- ▶ Limerick, Ireland (Buckley)
- ▶ INRIA Eiffel group, Paris (Détienne, Visser)
- ▶ Fraunhofer (Wulf)

Other US centres

- ▶ University of Colorado at Boulder
 - ▶ Gerhard Fischer & Alex Reppenning
- ▶ MIT Media Lab
 - ▶ Henry Lieberman
- ▶ IBM Research TJ Watson
 - ▶ Rachel Bellamy
- ▶ IBM Research Almaden
 - ▶ Allen Cypher
- ▶ Microsoft Research Redmond
Human Interactions in Programming (HIP) group
 - ▶ Rob DeLine, Gina Venolia & Andrew Begel

Current areas of theoretical attention

Cognitive Dimensions of Notations

- ▶ Programming as interaction with an information structure (Ch 2.2 of PoP book)
- ▶ Sample dimension
 - ▶ Viscosity: a viscous system is difficult to change
- ▶ Resources:
 - ▶ Visual language usability paper in JVLC by Green & Petre
 - ▶ Tutorial by Green & Blackwell
 - ▶ Questionnaire by Blackwell & Green
 - ▶ Chapter in Carroll book

CDs Theory

- ▶ Any visible notation encodes an information structure.
 - ▶ The structure has different parts
 - ▶ The parts have various relationships to each other
- ▶ Notational Layers
 - ▶ one structure is often derived from another with similar parts and relationships
 - ▶ e.g. web page, from PHP program, from UML diagram, from whiteboard sketch, from business plan

Notational Activities

- ▶ Search:
 - ▶ finding information in a familiar structure
- ▶ Exploratory understanding:
 - ▶ understand a structure you haven't seen
- ▶ Incrementation:
 - ▶ add new items to existing structure
- ▶ Modification:
 - ▶ change an existing structure
- ▶ Transcription:
 - ▶ create a new structure derived from an existing layer
- ▶ Exploratory design:
 - ▶ create a structure you don't understand yet

Attention Investment

- ▶ Cost-benefit equation - compare mental effort:
 - ▶ to carry out a programming task
 - ▶ against effort saved by the program
- ▶ With associated risk/uncertainty:
 - ▶ In estimate of effort to finish the program
 - ▶ In actual benefit if the program has a bug
 - ▶ In chance of damage resulting from a severe bug

Attention Investment Biases

- ▶ Some expert programmers:
 - ▶ under-estimate costs, and over-estimate benefits
- ▶ Novices might be reluctant to engage in programming:
 - ▶ If they over-estimate the costs
 - ▶ If they over-estimate risk of negative return
 - ▶ Tools can provide 'gentle slope' to reduce this bias
 - ▶ E.g. surprise – explain - reward

Gender HCI

- ▶ Attention investment + self-efficacy theory
- ▶ You need confidence to start programming
 - ▶ Attention investment means that female students are less inclined to explore programming options.
- ▶ You need to do programming to gain confidence
 - ▶ Self-efficacy develops through time spent experimenting
- ▶ Encourage 'tinkering' to explore behaviour
 - ▶ But note that the same kind of tinkering can result in poorer learning for males, who have a tendency to be over-confident, and not to think about what they are doing

Programming by Example

- ▶ Based on machine learning techniques
- ▶ Infer programs from examples of required output
- ▶ Attention Investment benefits:
 - ▶ examples can be provided through normal direct manipulation, so reduced perceived cost
 - ▶ inferred program is offered to user when already functional, so reduced perceived risk

Natural Programming

- ▶ Programme of Myers' group at Carnegie Mellon
- ▶ Study natural/everyday description of algorithms
- ▶ Design programming languages compatible with naïve knowledge
 - ▶ Pane's HANDS (for children)
 - ▶ Miller's LAPIS (for text manipulation)
 - ▶ Ko's CITRUS (constraint-based MVC platform)

Variable Roles

- ▶ Programme of Sajaniemi's group at Joensuu
- ▶ Based on analysis of source code corpuses
- ▶ Unlike Myer's focus on naïve knowledge, this focuses on expert knowledge
- ▶ Variables are used in only a few ways:
 - ▶ fixed, stepper, follower, gatherer etc
- ▶ Originally used for educational visualisation, instruction
- ▶ May be used for intelligent compilers in future

Agile/Pair Programming

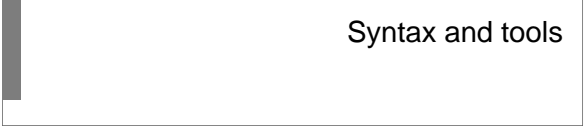

- ▶ Study interaction between people doing pair programming
- ▶ theoretical focus on sociology rather than psychology
- ▶ See Computer-Supported Collaborative Work (CSCW) rather than HCI.

Programming Aptitude

- ▶ How to identify good programmers?
 - ▶ good programmers are commercially valuable
 - ▶ Identify talented students
 - ▶ Identify students needing additional help
- ▶ Seldom any theoretical explanation, just psychometric correlations
 - ▶ cognitive style
 - ▶ personality measures
 - ▶ autism spectrum diagnoses

Organizational Contexts

- ▶ Speciality of Microsoft HIP group
- ▶ Long-term studies of professional programmers in realistic teams
- ▶ Maintaining code bases on an industrial scale
 - ▶ E.g. what activities are involved when a new programmer joins an established team?
- ▶ Hard to achieve for academics
 - ▶ beyond the resources of academic research budgets
 - ▶ relies on access to commercially sensitive information

Syntax and tools

Integrated Development Environments

- ▶ The language is not the only usability problem
 - ▶ Manage modules & dependencies
 - ▶ integrated editors
 - ▶ debugging and visualisation tools
- ▶ Some research using custom plug-ins for Eclipse
- ▶ Burnett's Forms/3 research platform
- ▶ Complete novel IDEs for education use
 - ▶ Bluej & Scratch
 - ▶ Extensions to CMU Alice
 - ▶ Ko's WhyLine
 - ▶ Kelleher's storytelling Alice
 - ▶ (compare Good's struggles with Neverwinter Nights)

Visual Languages

- ▶ The ambition dates back to 60s and 70s
 - ▶ Idea of measuring improvement arrived at IEEEVL 1996
 - ▶ IEEEVL became IEEEVL/HCC soon afterward
- ▶ Pioneering commercial products
 - ▶ National Instruments LabVIEW
 - ▶ Prograph
- ▶ Recent examples
 - ▶ Yahoo Pipes
 - ▶ Microsoft Kodu
 - ▶ Google AppInventor
- ▶ Most could benefit from evaluation, or application of Cognitive Dimensions

Spreadsheets

- ▶ Widely used, sometimes for surprising purposes
 - ▶ A large proportion of commercial spreadsheets contain errors (Panko)
 - ▶ Spreadsheet research corpus (Scaffidi)
- ▶ Empirical studies and extensions:
 - ▶ Excel
 - ▶ Burnett's Forms/3, with free-format cells
- ▶ Specific usability improvements:
 - ▶ testing and debugging facilities such as WYSIWYT (Burnett)
 - ▶ type systems and generators (Erwig)
 - ▶ Functional programming in Excel (Peyton-Jones, Blackwell, Burnett)

Scripting Languages

- ▶ Allow users to customize and extend products, e.g.
 - ▶ LISP variants in AutoCAD and EMACS
 - ▶ Linden Scripting Language (LSL) in Second Life
 - ▶ Apple Automator (and earlier Hypercard)
- ▶ Key research concern in end-user programming (later)
 - ▶ Note that many evolve into professional languages (Perl, Flash)
 - ▶ While others never really considered end-user needs (TCL, JavaScript)
- ▶ Can address attention investment by starting with macro recording, then exposing source code for modification
 - ▶ Visual Basic in Microsoft Word
 - ▶ CoScripter for Firefox (Allen Cypher)

Lecture 2: Research methods in the study of programming.

Ethical Issues in Research

- ▶ Review the Cambridge Technology Ethics guide
 - ▶ What kind of study are you planning?
 - ▶ What potential concerns might there be?
 - ▶ What will you do to address them?
- ▶ Submit a proposal to the Computer Lab Ethics committee, giving above details.

Controlled Experimental Methods

- ▶ **Participants** (subjects), potentially in **groups**
- ▶ Experimental **task**
- ▶ Performance **measures** (speed & accuracy)
- ▶ Trials
- ▶ **Conditions** / Treatments / Manipulations
 - ▶ modify the programming language
 - ▶ use different languages
 - ▶ Use different features of the programming environment
- ▶ **Effect** of treatments on sample means
 - ▶ Within-subjects (each participant uses all versions)
 - ▶ Between-subjects (different groups use different versions)

Controlled Experiments

- ▶ Based on a number of observations:
 - ▶ How long did Fred take to fix this bug (speed)?
 - ▶ Did he get it right (accuracy)?
- ▶ But every observation is different.
- ▶ So we compare averages:
 - ▶ Over a number of trials
 - ▶ Over a range of people (participants)
- ▶ Results often have a normal distribution
 - ▶ Compare difference of means
- ▶ Require significance testing
 - ▶ What likelihood that result could occur at random?
 - ▶ Is difference of means large relative to variance?

Typical experimental tasks

- ▶ Production tasks
 - ▶ write a program that is correct, and write it quickly
- ▶ Comprehension tasks
 - ▶ understanding, interpretation or recall
- ▶ Search tasks
 - ▶ find code responsible for functionality, or bug
- ▶ May be possible to use standardised tasks, for comparison to previous PPIG research
 - ▶ See Blackwell list
 - ▶ But 'toy problems can lack external validity
- ▶ Perhaps use the six Cognitive Dimensions activities?

Experimental Manipulations

- ▶ Compare productivity gains (effect size) of version with new feature to one without?
 - ▶ Will system work without the new feature?
 - ▶ Will the experimental task be meaningful if the feature is disabled?
 - ▶ Must new feature be presented second in a within-subjects comparison (order effect)
 - ▶ Is your system sufficiently well-designed for external validity of productivity measure?
- ▶ Test a fundamental research question?
 - ▶ e.g. imperative vs declarative paradigms, textual vs visual syntax
 - ▶ Are your two languages properly representative of the paradigms, yet also equivalent in other respects?
 - ▶ Are your experimental tasks equally suited to different paradigms?
- ▶ Is full implementation necessary?
 - ▶ Can you simulate features with Wizard of Oz technique?

Measurement

- ▶ Speed (classically 'reaction time')
 - ▶ E.g. time to write program
- ▶ Accuracy (number of (non)errors).
 - ▶ Is program correct?
- ▶ Trade-off between speed and accuracy?
 - ▶ Or poor performance on both?
 - ▶ Check correlation between them
- ▶ Task completion:
 - ▶ Stop after a fixed amount of time (ideally < 1 hour)
 - ▶ Measure proportion of the overall task completed

Self-Report

- ▶ Did you find this easy to use? (Likert scale)
 - ▶ applied value: appeal to customers
 - ▶ theoretical value: estimate 'cognitive load'
- ▶ Danger of bias
 - ▶ Subjective impressions of performance inaccurate
 - ▶ Suffer from experimental demand
 - ▶ Participants want to be nice to the experimenter
 - ▶ Should disguise which manipulation is the novel one
- ▶ May be necessary to capture affect measures:
 - ▶ Did you enjoy it, feel creative/ enthusiastic?
- ▶ Alternative is to collect 'richer' data ...

Think-aloud

- ▶ "Tell me everything you are thinking"
 - ▶ 'concurrent verbalisation'
- ▶ Problems:
 - ▶ Hard tasks become even harder while speaking aloud
 - ▶ During the most intense (interesting) periods, participants simply stop talking,
- ▶ Alternative:
 - ▶ make video recording, or eye-tracking trace
 - ▶ playback for participant to narrate
 - ▶ 'retrospective verbal report'

Qualitative Data

- ▶ Protocol analysis methods, e.g.
 - ▶ verbal protocol – transcript of recorded verbal data
 - ▶ video protocol – recording of actions
- ▶ Hypothesis-, or theory-driven
 - ▶ Create ‘coding frame’ for hypothesised categories of behaviour
 - ▶ Segment the protocol into episodes, utterances, phrases etc
 - ▶ Classify these into relevant categories (with inter-rater reliability)
 - ▶ Compare frequency or order statistically
- ▶ Grounded theory (ch 7 of HCI Research Methods)
 - ▶ Open coding, looking for patterns in the data
 - ▶ Stages of thematic grouping and generalization
 - ▶ Constant comparison of emerging framework to original data
 - ▶ More interpretive, danger of subjective bias

Experiment Design

- ▶ Arrangement of participants, groups, tasks, trials, conditions, measures, and hypothesized effects of treatments
- ▶ Within-subjects designs are preferred
 - ▶ because so much variation between programmers
- ▶ This leads to order effects:
 - ▶ first condition may seem worse, because of learning effect
 - ▶ last condition may suffer from fatigue effect
 - ▶ task familiarity – can’t use the same task twice
- ▶ Precautions:
 - ▶ Prior training to reduce learning effects
 - ▶ Minimise experimental session length to reduce fatigue effects
 - ▶ Use different tasks in each condition, but ‘balance’ with treatment and order
- ▶ These are typically combined in a ‘latin square’ where each participant gets a different combination

Analysis

- ▶ For an easy life, plan your analysis before collecting data!
- ▶ Will quantitative data be normally distributed?
 - ▶ t-test to compare two groups
 - ▶ ANOVA to compare effect of multiple conditions (which include latin square of task and order)
 - ▶ Pearson correlation to compare relationship between measures
- ▶ Distributions of task times are often skewed:
 - ▶ a small number of individuals complete the task quite slowly
 - ▶ don’t exclude ‘outliers’ who have difficulty with your system
 - ▶ log transform of time is usually found to be normally distributed
- ▶ Subjective ratings are seldom normally distributed
 - ▶ chi-square test of categories
 - ▶ ‘non-parametric’ comparison of means

Evaluation

- ▶ Rather than testing hypothesis, or comparing treatments
 - ▶ ask ‘is my language usable?’
- ▶ More typical of commercial practice, for short-term goals, rather than general understanding
 - ▶ Formative evaluation assesses options early in design process
 - ▶ Summative evaluation identifies usability problems in a system you have built
 - ▶ Repeated for iterative refinement in user-centred design
- ▶ Weaker research, because no direct contribution to theory
 - ▶ However some mainstream applied research venues are starting to require evidence of any claims made for new tools
 - ▶ e.g. ICSE, OOPSLA/SPLASH

Field Study Methods

- ▶ Laboratory studies are not adequate for:
 - ▶ organizational context of software development
 - ▶ interaction within software development teams
 - ▶ behaviour of programmers in actual work context
- ▶ Typical methods:
 - ▶ 'contextual inquiry' interviews
 - ▶ 'focus group' discussions
 - ▶ 'case studies' of projects or organisations
 - ▶ 'ethnographic' field work as participant-observer
- ▶ All result in qualitative data, often transcribed, and analysed using grounded theory approaches
- ▶ You won't have time!

Lecture 3: Special classes of programming language use

Educational Languages

- ▶ Computer Science Education vs programming for children
 - ▶ Papert's Logo
 - ▶ Kay's Smalltalk
 - ▶ Repenning's AgentSheets
 - ▶ Cypher and Smith's StageCast
 - ▶ Kahn's ToonTalk
 - ▶ Kolling's Greenfoot
 - ▶ Carnegie Mellon's Alice
 - ▶ MIT's Scratch
- ▶ Many use VL techniques, to overcome syntax problems
 - ▶ Is it 'cheating' to avoid teaching syntax?
 - ▶ Or motivate children by making it easy for them to do things that interest them (videogames or animations)
 - ▶ 'learning to program' or 'programming to learn'?
 - ▶ 'user-centred' or 'curriculum-centred' design?
- ▶ If curriculum, what theoretical principles? Logic? Functional? Objects?

End-User Programming

- ▶ In Information Systems 'user' is a (professional) organisation
 - ▶ 'end-user' is a person who will actually use the system
 - ▶ an 'end-user programmer' both writes the program and uses it.
 - ▶ 'end-user development' (EUD)
 - ▶ 'end-user customisation' (EUC)
- ▶ Interesting research because:
 - ▶ An externally valid source of 'novice' programmers
 - ▶ Ubiquitous computing increases market for customisation
 - ▶ Professional programmers don't complain enough

End-User Programming

- ▶ EUP is usually defined to refer to a person who has
 - ▶ not trained as a programmer
 - ▶ not primarily employed as a programmer
 - ▶ does not program for its own sake, but as a means to an end
- ▶ Motivation for end-user software engineering (e.g. testing and debugging)
 - ▶ programs may be used by other people
 - ▶ programs may be business-critical
- ▶ Domain-specific languages
 - ▶ Programming 'novices' are often domain experts
 - ▶ LabView, MATLAB are both DSLs
 - ▶ Even some mainstream tools are increasingly domain-specific, e.g. VPF

Creative mashups and composition

- ▶ Not like military, industrial, bureaucratic domains
 - ▶ those are well structured, with ample resources.
 - ▶ leisure, media and the arts imply 'discretionary-use'
- ▶ digital media creators collage, sample & mash-up
 - ▶ art strategies are next generation agile methods
- ▶ Current generation of artist languages
 - ▶ Max/MSP (+ Jitter)
 - ▶ Processing
 - ▶ SuperCollider
- ▶ Current research in Cambridge
 - ▶ Flow in composition
 - ▶ Live coding
 - ▶ EUSE for improvisation processes

Domestic automation

- ▶ Classic domestic HCI challenges
 - ▶ home heating controls
 - ▶ VCR programming
 - ▶ privacy configuration
- ▶ Home networking
 - ▶ WiFi, Zigbee, X10
 - ▶ AutoHAN
 - ▶ software plumber or software DIY?
- ▶ Research opportunities
 - ▶ Understand domestic economy of digital technology
 - ▶ Apply gentle slope and attention investment

Lecture 4: Planning practical empirical studies.

Goal

- ▶ Prepare for design of your study
- ▶ Previous lectures followed:
 - ▶ theories of programming
 - ▶ experimental methods
 - ▶ specific users and programming technologies
- ▶ We use reverse order:
 - ▶ specific programming technologies and users
 - ▶ experimental methods
 - ▶ theories of programming

Candidate programming languages/tools

- ▶ your own personal research
 - ▶ e.g. MPhil dissertation
- ▶ Other research
 - ▶ other research in Cambridge
 - ▶ recent product releases
 - ▶ research prototypes developed elsewhere
- ▶ Who is the intended user?
- ▶ What will they be trying to achieve?

Representative tasks and measures

- ▶ Identify user activities you plan to observe
 - ▶ assigned tasks (controlled experiment)
 - ▶ or user's goal (observational study)
- ▶ Will these explore an interesting research question?
- ▶ What measures are relevant to that question?
- ▶ Will qualitative data analysis be necessary?
- ▶ Will there be a threat to external validity?
 - ▶ From task, measure or analysis

Review of study design options

- ▶ Do you wish to carry out a comparison, an evaluation, or an open exploratory study?
- ▶ If you plan to conduct a controlled experiment, will it be possible to use a within-subjects design?
- ▶ What data analysis method will you use?
- ▶ What would you need to do in order to complete a pilot study?
- ▶ What ethical issues are raised by your planned research?

Theoretical goal

- ▶ What do you expect to learn from conducting your study?
- ▶ What contribution will it make to the research literature relevant to usability of programming languages?
- ▶ Where would you publish the results?

Course structure

- ▶ Assignment A, presented at seminars 1 & 2
 - ▶ Target language, paradigm, tool or environment
 - ▶ Review of relevant literature
 - ▶ Study design
 - ▶ Outline of analytic methods
- ▶ Assignment B, presented at seminars 3 & 4
 - ▶ Full experimental report
 - ▶ Data analysis and findings
 - ▶ Suitable for publication at venue such as PPIG
