#### Computer Graphics & Image Processing Peter Robinson

Sixteen lectures for Part IB CST Four supervisions suggested Two exam questions on Paper 4

# What are Computer Graphics & Image Processing?

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# Why bother with CG & IP?

 $+ A \parallel$  visual computer output depends on CG

- printed output (laser/ink jet/phototypesetter)
- monitor (CRT/LCD/plasma/DMD)
- all visual computer output consists of real images generated by the computer from some internal digital image

Much other visual imagery depends on CG & IP

- TV & movie special effects & post-production
- most books, magazines, catalogues, flyers, brochures, junk mail, newspapers, packaging, posters

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dedgson & Peter Robinson

#### What are CG & IP used for?

#### + 2D computer graphics

- graphical user interfaces: Mac, Windows, X…
- graphic design: posters, cereal packets...
- typesetting: book publishing, report writing...

#### Image processing

- photograph retouching: publishing, posters...
- photocollaging: satellite imagery...
- art: new forms of artwork based on digitised images
- + 3D computer graphics
  - visualisation: scientific, medical, architectural...
  - Computer Aided Design (CAD)
  - entertainment: special effect, games, movies...

## **Course Structure**

+ Background [2L]

- images, colour, human vision, resolution
- Simple rendering [2L]
  - perspective, surface reflection, geometric models, ray tracing
- + Graphics pipeline [4L]
  - ◆ polygonal models, transformations, projection (3D→2D), hardware and OpenGL, lighting and shading, texture
- Underlying algorithms [4L]
  - drawing lines and curves, clipping, filling, depth, anti-aliasing
- + Colour and displays [2L]
- Image processing [2L]
  - filtering, compositing, half-toning, dithering, encoding

# **Course books**

+ Fundamentals of Computer Graphics

 Shirley & Marschner CRC Press 2009 (3<sup>rd</sup> edition)

+ Computer Graphics: Principles & Practice

- Hughes, van Dam, McGuire, Skalar, Foley, Feiner & Akele Addison-Wesley 2013 (3<sup>rd</sup> edition)
- + Computer Graphics & Virtual Environments
  - Slater, Steed, & Chrysanthou Addison Wesley 2001

+ Digital Image Processing

Gonzalez & Woods
Prentice Hall 2007 (3<sup>rd</sup> edition)

## **Computer Graphics & Image Processing**

#### + Background

- Digital images
- Lighting and colour
- Human vision
- Simple rendering
- + Graphics pipeline
- Underlying algorithms
- + Colour and displays
- +Image processing

### Background

+ what is a digital image?

- what are the constraints on digital images?
- how does human vision work?
  - what are the limits of human vision?
  - what can we get away with given these constraints & limits?
- + what are the implications?

Later on in the course we will ask:

- + how do we represent colour?
- + how do displays & printers work?
  - how do we fool the human eye into seeing what we want?

## What is an image?

+two dimensional function

value at any point is an intensity or colour

+ not digital!

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# What is a *digital* image?

+a contradiction in terms

- if you can see it, it's not digital
- if it's digital, it's just a collection of numbers
- +a sampled and quantised version of a real image
- + a rectangular array of intensity or colour values

### Image capture

+a variety of devices can be used

- scanners
  - line CCD (charge coupled device) in a flatbed scanner

flatbed scanner

www.nuggetlab.com

- spot detector in a drum scanner
- cameras
  - area CCD
  - CMOS camera chips

area CCD www.hll.mpg.de

The image of the Heidelberg drum scanner and many other images in this section come from "Handbook of Print Media".

by Helmutt Comparer G Springer-Verlag, 2001

Heidelberg drum scanner

#### Image capture example

A digital image

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## Image display

- A digital image is an array of integers, how do you display it?
- reconstruct a real image on some sort of display device
  - LCD portable computer, video projector
  - DMD video projector
  - EPS electrophoretic display "e-paper"
  - printer ink jet, laser printer, dot matrix, dye sublimation, commercial typesetter

# Different ways of displaying the same digital image

Nearest-neighbourGaussianHalf-toninge.g. LCDe.g. cathode ray tubee.g. inkjet printer

the display device has a significant effect on the appearance of the displayed image

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# Sampling

- a digital image is a rectangular array of intensity values
- + each value is called a *pixel*

"picture element"

- sampling resolution is normally measured in pixels per inch (ppi) or dots per inch (dpi)
  - computer monitors have a resolution around 100 ppi
  - laser and ink jet printers have resolutions between 300 and I 200 ppi
  - typesetters have resolutions between 1000 and 3000 ppi

# **Sampling resolution**

64×64

128×128

256×256

Conviger Graphics & Image Processing 2014 (c) 1996-2014 Neige Bodgson & Peter Robinson 6×16

32×32

## Quantisation

+ each intensity value is a number

- for digital storage the intensity values must be quantised
  - Iimits the number of different intensities that can be stored
  - Iimits the brightest intensity that can be stored

#### how many intensity levels are needed for human consumption

- 8 bits often sufficient
- some applications use 10 or 12 or 16 bits
- more detail later in the course

#### + colour is stored as a set of numbers

usually as 3 numbers of 5–16 bits each

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## **Quantisation levels**

8 bits (256 levels)

7 bits

6 bits (64 levels)

5 bits (32 levels)

l bit 2 bits 4 bits Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson (2 levels) (4 levels) (16 levels)

# What is required for vision?

#### + illumination

some source of light

+ objects

which reflect (or transmit) the light

to capture the light as an image

transmission

reflection

#### Light: wavelengths & spectra

- Iight is electromagnetic radiation
  - visible light is a tiny part of the electromagnetic spectrum
  - visible light ranges in wavelength from 700nm (red end of spectrum) to 400nm (violet end)
- + every light has a spectrum of wavelengths that it emits
- every object has a spectrum of wavelengths that it reflects (or transmits)
- the combination of the two gives the spectrum of wavelengths that arrive at the eye

#### The spectrum

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# Illuminants have different characteristics

- different lights emit different intensities of each wavelength
  - sunlight is reasonably uniform

- incandescent light bulbs are very red
- sodium street lights emit almost pure yellow

www.gelighting.com/na/business lighting/education resources/learn about light/

# Illuminant × reflection = reflected light

#### incandescent light bulb

#### Comparison of illuminants

compare these things:

 colour of the monkey's nose and paws: more red under certain lights

oranges & yellows(similar in all)

blues & violets
(considerably
different)

Completera sura light ge Processing 2024 og en 6 ight but but bod over hera d) binson

#### The workings of the human visual system

 to understand the requirements of displays (resolution, quantisation and colour) we need to know how the human eye works...

#### Structure of the human eye

- the retina is an array of light detection cells
- the fovea is the high resolution area of the retina
- the optic nerve takes signals from the retina to the visual cortex in the brain

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Fig. 2.1 from Gonzalez & Woods

## The retina

- consists of about 150 million light receptors
- + retina outputs information to the brain along the optic nerve
  - there are about one million nerve fibres in the optic nerve
  - the retina performs significant pre-processing to reduce the number of signals from 150M to 1M
  - pre-processing includes:
    - averaging multiple inputs together
    - colour signal processing
    - Iocal edge detection

### **Detailed structure of retinal processing**

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson www.phys.ufl.edu/~avery/course/3400/vision/retina\_schema.jpg

# Light detectors in the retina

#### two classes

- rods
- cones
- + cones come in three types
  - sensitive to short, medium and long wavelengths
  - allow you to see in colour
- the cones are concentrated in the macula, at the centre of the retina
- the fovea is a densely packed region in the centre of the macula
  - contains the highest density of cones
  - provides the highest resolution vision

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## **Foveal vision**

#### + 150,000 cones per square millimetre in the fovea

- high resolution
- 🔶 colour
- + outside fovea: mostly rods
  - lower resolution
    - many rods' inputs are combined to produce one signal to the visual cortex in the brain
  - principally monochromatic
    - there are very few cones, so little input available to provide colour information to the brain
  - provides peripheral vision
    - allows you to keep the high resolution region in context
    - without peripheral vision you would walk into things, be unable to find things easily, and generally find life much more difficult

## **Distribution of rods & cones**

cones in the fovea

(1) cones in the fovea are squished together more tightly than outside the fovea: higher resolution vision;

(2) as the density of cones drops the gaps between them are filled with rods

Fig. 2.2 from Computer & Woohigs & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinsbide the fovea www.cis.rit.edu/people/faculty/montag/vandplite/pages/chap\_9/ch9p1.html

# **Colour vision**

Normalised absorbance

- there are three types of cone
- each responds to a different spectrum
  - *very* roughly long, medium, and short wavelengths
  - each has a response function:  $l(\lambda), m(\lambda), s(\lambda)$
- different numbers of the different types
  - far fewer of the short wavelength receptors
  - so cannot see fine detail in blue
- overall intensity response of the cones can be calculated
  - $y(\lambda) = l(\lambda) + m(\lambda) + s(\lambda)$
  - $y = k \int P(\lambda) y(\lambda) d\lambda$  is the perceived *luminance* in the fovea
  - $y = k \int P(\lambda) r(\lambda) d\lambda$  is the perceived *luminance* outside the fovea Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson function of the rods

# **Distribution of different cone types**

# simulated cone distribution at the centre of the fovea

- this is about 1° of visual angle
- + distribution is:
  - 7% short, 37% medium, 56% long
- short wavelength receptors
  - regularly distributed
  - not in the central <sup>1</sup>/3°
  - outside the fovea, only 1% of cones are short
- Iong & medium
  - about 3:2 ratio long:medium

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson www.cis.rit.edu/people/faculty/montag/vandplite/pages/chap\_9/ch9p1.html

# Colour signals sent to the brain

the signal that is sent to the brain is pre-processed by the retina

wavelength (nanometers)

### Chromatic metamerism

- many different spectra will induce the same response in our cones
  - the values of the three perceived values can be calculated as:
    - $1 = k \int P(\lambda) l(\lambda) d\lambda$
    - $m = k \int P(\lambda) m(\lambda) d\lambda$
    - $s = k \int P(\lambda) s(\lambda) d\lambda$
  - $\blacksquare$  k is some constant,  $P(\lambda)$  is the spectrum of the light incident on the retina
  - two different spectra (e.g.  $P_1(\lambda)$  and  $P_2(\lambda)$ ) can give the same values of l, m, s
  - we can thus fool the eye into seeing (almost) any colour by mixing correct proportions of some small number of lights

# Mixing coloured lights

by mixing different amounts of red, green, and blue lights we can generate a wide range of responses in the human eye

Complie Gradine Orlagerso ceasing bee 4 created in this general representation
# Some of the processing in the eye

#### + discrimination

discriminates between different intensities and colours

#### + adaptation

- adapts to changes in illumination level and colour
- can see about 1:100 contrast at any given time
- but can adapt to see light over a range of 10<sup>10</sup>

#### + persistence

- integrates light over a period of about 1/30 second
- + edge detection and edge enhancement
  - visible in e.g. Mach banding effects

# **Intensity adaptation**

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Fig. 2.4 from Gonzalez & Woods

# Intensity differentiation

the eye can obviously differentiate between different colours and different intensities

 Weber's Law tells us how good the eye is at distinguishing different intensities using just noticeable differences

for a range of values of I

- start with  $\Delta I=0$ increase  $\Delta I$  until human observer can just see a difference
- start with  $\Delta I$  large decrease  $\Delta I$  until human observer can just *not* see a difference

# **Intensity differentiation**

+ results for a "normal" viewer

- a human can distinguish about a 2% change in intensity for much of the range of intensities
- discrimination becomes rapidly worse as you get close to the darkest or brightest intensities that you can currently see

## Simultaneous contrast

the eye performs a range of non-linear operations
for example, as well as responding to changes in overall light, the eye responds to local changes

The centre square is the same intensity in all four cases but does not appear to be because your visual system is taking the local contrast into account

## Mach bands

 show the effect of edge enhancement in the retina's pre-processing

Each of the nine rectangles is a constant colour but you will see each rectangle being slightly brighter at the end which is near a darker rectangle and slightly darker at the end which is near a lighter rectangle

## **Ghost squares**

#### +another effect caused by retinal pre-processing

- the edge detectors *Outside* the fovea cause you to see grey squares at the corners where four black squares join
- the fovea has sufficient resolution to avoid this "error"

## Summary of what human eyes do...

- + sample the image that is projected onto the retina
- +adapt to changing conditions
- + perform non-linear pre-processing
  - makes it very hard to model and predict behaviour
- combine a large number of basic inputs into a much smaller set of signals
  - which encode more complex data
    - e.g. presence of an edge at a particular location with a particular orientation rather than intensity at a set of locations
- pass pre-processed information to the visual cortex
   which performs extremely complex processing
   Computer discussed in Pthessing/2004/15/19/65/04 NOULES goon & Peter Robinson

## Implications of vision on resolution

The acuity of the eye is measured as the ability to see a white gap, I minute wide, between two black lines

- about 300dpi at 30cm
- the corresponds to about 2 cone widths on the fovea
- +Resolution decreases as contrast decreases
- + Colour resolution is lower than intensity resolution
  - this is exploited in video encoding
    - the colour information in analogue television has half the spatial resolution of the intensity information
    - the colour information in digital television has less spatial resolution and fewer quantisation levels than the intensity information

# Implications of vision on quantisation

- Humans can distinguish, at best, about a 2% change in intensity
  - not so good at distinguishing colour differences
- We need to know what the brightest white and darkest black are
  - most modern display technologies (LCD or DLP) have static contrast ratios quoted in the thousands
    - actually in the hundreds other in a completely dark room
  - movie film has a contrast ratio of about 1000:1
- $\Rightarrow$  12–16 bits of intensity information
  - assuming intensities are distributed linearly
    - this allows for easy computation
- Computer 8 and a reasoft energice 2014 ble, exception in Perpendia Peter Egripson

# Storing images in memory

+8 bits became a *de facto* standard for greyscale images

- 8 bits = 1 byte
- I6 bits is now being used more widely, I6 bits = 2 bytes
- an 8 bit image of size W × H can be stored in a block of W × H bytes
- one way to do this is to store pixel [x] [y] at memory location base + x + W × y

memory is ID, images are 2D

## **Colour images**

- tend to be 24 bits per pixel
  - 3 bytes: one red, one green, one blue
  - increasing use of 48 bits per pixel, 2 bytes per colour plane
- can be stored as a contiguous block of memory
  - of size  $W \times H \times 3$
- more common to store each colour in a separate "plane"
  - **each** plane contains just  $W \times H$  values
- the idea of planes can be extended to other attributes associated with each pixel
  - alpha plane (transparency), z-buffer (depth value), A-buffer (pointer to a data structure containing depth and coverage information), overlay planes (e.g. for displaying pop-up menus) see later in the course for details

## The frame buffer

most computers have a special piece of memory reserved for storage of the current image being displayed

the frame buffer normally consists of dual-ported Dynamic RAM (DRAM)

sometimes referred to as Video RAM (VRAM)

## **Double buffering**

- if we allow the currently displayed image to be updated then we may see bits of the image being displayed halfway through the update
  - this can be visually disturbing, especially if we want the illusion of smooth animation
- double buffering solves this problem: we draw into one frame buffer and display from the other
  - when drawing is complete we flip buffers

## Modern graphics cards

- most graphics processing is now done on a separate graphics card
- the CPU communicates primitive data over the bus to the special purpose Geometry Processing Unit (GPU)
- there is additional video memory on the graphics card, mostly used for storing textures, which are mostly used in 3D games

## **Graphics card architecture**

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson based on nVIDIA's GeForce 6 architecture

# **Computer Graphics & Image Processing**

#### ✦ Background

#### Simple rendering

- Projection, depth and perspective
- Reflection from surfaces
- Ray tracing
- + Graphics pipeline
- Underlying algorithms
- + Colour and displays
- +Image processing

# **3D** ⇒ **2D** projection

#### +to make a picture

- ♦ 3D world is projected to a 2D image
  - like a camera taking a photograph
  - the three dimensional world is projected onto a plane

The 3D world is described as a set of (mathematical) objects

e.g. sphere	radius (3.4) centre (0,2,9)
e.g. box	size (2,4,3) centre (7, 2, 9) orientation (27°, 156°)

# **Types of projection**

#### + parallel

- e.g.  $(x, y, z) \rightarrow (x, y)$
- useful in CAD, architecture, etc
- looks unrealistic
- perspective
  - e.g.  $(x, y, z) \rightarrow \left(\frac{x}{z}, \frac{y}{z}\right)$
  - things get smaller as they get farther away
  - looks realistic
    - this is how cameras work

Cabinet projection

Parallel to X axis

Parallel to Y axis

Parallel to Z axis

## **Depth cues**

## **Rendering depth**

## Wrong perspective

 Adoring saints
 Lorenzo Monaco 1407-09
 National Gallery London

## Perspective

 Holy Trinity fresco
 Masaccio (Tommaso di Ser Giovanni di Simone) 1425
 Santa Maria Novella Florence

## **More perspective**

- The Annunciation with Saint Emidius
- + Carlo Crivelli 1486
- National Gallery London

## **Perspective projection examples**

Gates Building – the rounded version (Stanford)

Gates Building – the rectilinear version (Cambridge)

# **False perspective**

64

# Calculating perspective

65

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

1. Section States and 1

## Illumination and shading

- Dürer's method allows us to calculate what part of the scene is visible in any pixel
- But what colour should it be?
- + Depends on:
  - lighting
  - shadows
  - properties of surface material

### **Different materials have different reflectances**

Processing 2014 Graphics & I

Neil A Dodason & Peter Robinson

67

### BRDF

# Bidirectional Reflectance Distribution Function

## BRDF

# Bidirectional Reflectance Distribution Function

•  $\rho(\theta_i, \phi_i; \theta_o, \phi_o)$ 

# BRDF

# Bidirectional Reflectance Distribution Function

•  $\rho(\theta_i, \phi_i; \theta_o, \phi_o)$ 

#### + Isotropic material

- Invariant when material is rotated
- BRDF is 3D
- $\rho(\theta_i, \theta_o, \phi_{diff})$

#### We can lookup the ρ value for a point (e.g., a vertex) if we know:

- the light's position
- the camera's position
- position and normal at the point

## Capturing an anisotropic BRDF

# **Equations for lighting**

 Rather than using a BRDF look-up table, we might prefer a simple equation

- This is the sort of trade-off that has occurred often in the history of computing
- Early years: memory is expensive, so use a calculated approximation to the truth
- More recently: memory is cheap, so use a large look-up table captured from the real world to give an accurate answer
- Examples include: surface properties in graphics, sounds for electric pianos/organs, definitions of 3D shape

### How do surfaces reflect light?

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Johann Lambert, 18<sup>th</sup> century German mathematician

## **Comments on reflection**

the surface can absorb some wavelengths of light

e.g. shiny gold or shiny copper

 specular reflection has "interesting" properties at glancing angles owing to occlusion of micro-facets by one another

- specular reflection in the light's colour
- diffuse reflection in the plastic's colour

## Calculating the shading of a surface

#### gross assumptions:

- there is only diffuse (Lambertian) reflection
- all light falling on a surface comes directly from a light source
  - there is no interaction between objects
- no object casts shadows on any other
  - so can treat each surface as if it were the only object in the scene
- light sources are considered to be infinitely distant from the object
  - the vector to the light is the same across the whole surface
- observation:
  - the colour of a flat surface will be uniform across it, dependent only on the colour & position of the object and the colour & position of the light sources

## **Diffuse shading calculation**

$$I = I_l k_d \cos \theta$$
$$= I_l k_d (N \cdot L)$$

*L* is a normalised vector pointing in the direction of the light source

N is the normal to the surface

- $I_l$  is the intensity of the light source
- $k_d$  is the proportion of light which is diffusely reflected by the surface

*I* is the intensity of the light reflected by the surface

use this equation to calculate the colour of a pixel

## Diffuse shading: comments

- can have different  $I_l$  and different  $k_d$  for different wavelengths (colours)
- watch out for  $\cos\theta < 0$ 
  - implies that the light is behind the polygon and so it cannot illuminate this side of the polygon
- do you use one-sided or two-sided surfaces?
  - one sided: only the side in the direction of the normal vector can be illuminated
    - if  $\cos\theta < 0$  then both sides are black
  - two sided: the sign of cosθ determines which side of the polygon is illuminated
    - need to invert the sign of the intensity for the back side
- this is essentially a simple one-parameter ( $\theta$ ) BRDF

## **Specular reflection**

 Phong developed an easy-tocalculate *approximation* to specular reflection

$$I = I_l k_s \cos^n \alpha$$
  
=  $I_l k_s (R \cdot V)^n$ 

- *L* is a normalised vector pointing in the direction of the light source
- *R* is the vector of perfect reflection
- N is the normal to the surface
- *V* is a normalised vector pointing at the viewer
- $I_l$  is the intensity of the light source
- $k_s$  is the proportion of light which is specularly reflected by the surface
- n is Phong's ad hoc "roughness" coefficient
- *I* is the intensity of the specularly reflected light

Phong Buc Juppe filtura instant in the generated pictures", CACM, 18(6), 1975, 311-7

Computer Graphics & Image Prodiffingeone (Lection) 14 Neil A Dodgson & Peter Robinson

## The gross assumptions revisited

- only diffuse reflection
  - now have a method of approximating specular reflection
- no shadows
  - need to do ray tracing or shadow mapping to get shadows
- lights at infinity
  - can add local lights at the expense of more calculation
    - need to interpolate the L vector
- no interaction between surfaces
  - cheat!
    - assume that all light reflected off all other surfaces onto a given surface can be amalgamated into a single constant term: "ambient illumination", add this onto the diffuse and specular illumination

## Shading: overall equation

 the overall shading equation can thus be considered to be the ambient illumination plus the diffuse and specular reflections from each light source

$$I = I_a k_a + \sum_i I_i k_d (L_i \cdot N) + \sum_i I_i k_s (R_i \cdot V)^n$$

the more lights there are in the scene, the longer this calculation will take

## Illumination & shading: comments

- how good is this shading equation?
  - gives reasonable results but most objects tend to look as if they are made out of plastic
  - Cook & Torrance have developed a more realistic (and more expensive) shading model which takes into account:
    - micro-facet geometry (which models, amongst other things, the roughness of the surface)
    - Fresnel's formulas for reflectance off a surface
  - there are other, even more complex, models
- is there a better way to handle inter-object interaction?
  - "ambient illumination" is a gross approximation
  - distributed ray tracing can handle specular inter-reflection
  - radiosity can handle diffuse inter-reflection

## Ray tracing

Identify point on surface and calculate illumination
 Given a set of 3D objects, shoot a ray from the eye through the centre of every pixel and see what surfaces it hits

shoot a ray through each pixel

whatever the ray hits determines the colour of that pixel

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## Ray tracing: examples

ray tracing easily handles reflection, refraction, shadows and blur

ray tracing is computationally expensive

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## Ray tracing algorithm

## Intersection of a ray with an object 1

polygon or disc

intersection the ray with the plane of the polygon

o as above

then check to see whether the intersection point lies inside the polygon

• a 2D geometry problem (which is simple for a disc) Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## Intersection of a ray with an object 2

## Ray tracing: shading

- once you have the intersection of a ray with the nearest object you can also:
  - calculate the normal to the object at that intersection point
  - shoot rays from that point to all of the light sources, and calculate the diffuse and specular reflections off the object at that point
    - this (plus ambient illumination) gives the colour of the object (at that point)

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## Ray tracing: shadows

 because you are tracing rays from the intersection point to the light, you can check whether another object is between the intersection and the light and is hence casting a shadow

> also need to watch for selfshadowing

## **Ray tracing: reflection**

 if a surface is totally or partially reflective then new rays can be spawned to find the contribution to the pixel's colour given by the reflection

> this is perfect (mirror) reflection

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## Ray tracing: transparency & refraction

- objects can be totally or partially transparent
  - this allows objects behind the current one to be seen through it
- transparent objects can have refractive indices
  - bending the rays as they pass through the objects
- transparency + reflection
   means that a ray can split into
   two parts

## Sampling

- we have assumed so far that each ray passes through the centre of a pixel
  - i.e. the value for each pixel is the colour of the object which happens to lie exactly under the centre of the pixel
- this leads to:
  - stair step (jagged) edges to objects
  - small objects being missed completely
  - thin objects being missed completely or split into small pieces

## **Anti-aliasing**

- these artefacts (and others) are jointly known as aliasing
- methods of ameliorating the effects of aliasing are known as anti-aliasing
  - in signal processing *aliasing* is a precisely defined technical term for a particular kind of artefact
  - in computer graphics its meaning has expanded to include most undesirable effects that can occur in the image
    - this is because the same anti-aliasing techniques which ameliorate true aliasing artefacts also ameliorate most of the other artefacts

## Sampling in ray tracing

#### single point

- shoot a single ray through the pixel's centre
- super-sampling for anti-aliasing
  - shoot multiple rays through the pixel and average the result
  - regular grid, random, jittered, Poisson disc
- adaptive super-sampling
  - shoot a few rays through the pixel, check the variance of the resulting values, if similar enough stop, otherwise shoot some more rays

## **Types of super-sampling 1**

#### regular grid

- divide the pixel into a number of sub-pixels and shoot a ray through the centre of each
- problem: can still lead to noticable aliasing unless a very high resolution sub-pixel grid is used

#### random

- shoot N rays at random points in the pixel
- replaces aliasing artefacts with noise artefacts
  - the eye is far less sensitive to noise than to aliasing

## Types of super-sampling 2

#### Poisson disc

- shoot N rays at random points in the pixel with the proviso that no two rays shall pass through the pixel closer than ε to one another
- for N rays this produces a better looking image than pure random sampling

very hard to implement properly

## **Types of super-sampling 3**

#### jittered

- $\blacksquare$  divide pixel into N sub-pixels and shoot one ray at a random point in each sub-pixel
- an approximation to Poisson disc sampling
- for N rays it is better than pure random sampling
- easy to implement

## jittered

#### Poisson disc

#### pure random

# More reasons for wanting to take multiple samples per pixel

- super-sampling is only one reason why we might want to take multiple samples per pixel
- many effects can be achieved by distributing the multiple samples over some range
  - called distributed ray tracing
    - N.B. *distributed* means distributed over a range of values
- can work in two ways
  - Deach of the multiple rays shot through a pixel is allocated a random value from the relevant distribution(s)
    - all effects can be achieved this way with sufficient rays per pixel
  - 2 each ray spawns multiple rays when it hits an object
    - this alternative can be used, for example, for area lights

## **Examples of distributed ray tracing**

- distribute the samples for a pixel over the pixel area
  - get random (or jittered) super-sampling
  - used for anti-aliasing
- distribute the rays going to a light source over some area
  - allows area light sources in addition to point and directional light sources
  - produces soft shadows with penumbrae
- distribute the camera position over some area
  - allows simulation of a camera with a finite aperture lens
  - produces depth of field effects
- distribute the samples in time
  - produces motion blur effects on any moving objects

## **Anti-aliasing**

one sample per pixel

multiple samples per pixel

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

### Area vs point light source

an area light source produces soft shadows

a point light source produces hard shadows

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## **Finite aperture**

102

left, a pinhole camera below, a finite aperture camera below left, 12 samples per pixel below right, 120 samples per pixel note the depth of field blur: only objects at the correct distance are in focus

## Distributed ray tracing for specular reflection

- previously we could only calculate the effect of perfect reflection
- we can now distribute the reflected rays over the range of directions from which specularly reflected light could come
- provides a method of handling some of the inter-reflections between objects in the scene
- requires a very large number of rays per pixel

## Handling direct illumination

#### diffuse reflection

- handled by ray tracing and polygon scan conversion
- assumes that the object is a perfect Lambertian reflector

#### + specular reflection

- also handled by ray tracing and polygon scan conversion
- use Phong's approximation to true specular reflection

## Handing indirect illumination: 1

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## Handing indirect illumination: 2

## **Multiple inter-reflection**

- light may reflect off many surfaces on its way (diffuse | specular)\*
   from the light to the camera
- standard ray tracing and polygon scan conversion can handle a single diffuse or specular bounce
- distributed ray tracing can handle multiple specular bounces
- radiosity can handle multiple diffuse bounces
- the general case cannot be handled by any efficient algorithm

diffuse | specular

(diffuse | specular) (specular)\*

(diffuse)\*

(diffuse | specular )\*

## **Computer Graphics & Image Processing**

- + Background
- + Simple rendering
- + Graphics pipeline
  - Polyhedral models
  - Perspective, shading and texture
  - OpenGL
- Underlying algorithms
- + Colour and displays
- +Image processing

## Unfortunately...

+ Ray tracing is computationally expensive

- used by hobbyists and for super-high visual quality
- Video games and user interfaces need something faster
  So:
  - Model surfaces as polyhedra meshes of polygons
  - Use composition to build scenes
  - Apply perspective transformation and project into plane of screen
  - Work out which surface was closest
  - Fill pixels with colour of nearest visible polygon

+ Modern graphics cards have hardware to support this

## **Three-dimensional objects**

 Polyhedral surfaces are made up from meshes of multiple connected polygons

- Polygonal meshes
  - open or closed
  - manifold or non-manifold
- Curved surfaces
  - must be converted to polygons to be drawn

# Surfaces in 3D: polygons

- ♦ 3 vertices (triangle) must be planar
- > 3 vertices, not necessarily planar

# Splitting polygons into triangles

- Most Graphics Processing Units (GPUs) are optimised to draw triangles
- Split polygons with more than three vertices into triangles

which is preferable?

# **2D transformations**

#### + why?

- it is extremely useful to be able to transform predefined objects to an arbitrary location, orientation, and size
- any reasonable graphics package will include transforms
  - 2D → Postscript
  - 3D → OpenGL

### **Basic 2D transformations**

#### scale

- about origin
- by factor *m*

#### rotate

- about origin
- by angle θ
- translate
  - along vector  $(x_o, y_o)$

$$x' = mx$$
$$y' = my$$

$$x' = x \cos \theta - y \sin \theta$$
$$y' = x \sin \theta + y \cos \theta$$

$$x' = x + x_o$$
$$y' = y + y_o$$

#### shear

- parallel to x axis
- by factor *a*

$$x' = x + ay$$
$$y' = y$$

# Matrix representation of transformations

+ scale

• about origin, factor *m* 

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} m & 0 \\ 0 & m \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

🔶 do nothing

identity

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

+ rotate

ullet about origin, angle  $\theta$ 

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

+ shear

• parallel to x axis, factor a

 $\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & a \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$ 

### Homogeneous 2D co-ordinates

 translations cannot be represented using simple 2D matrix multiplication on 2D vectors, so we switch to homogeneous co-ordinates

$$(x, y, w) \equiv \left(\frac{x}{w}, \frac{y}{w}\right)$$

- an infinite number of homogeneous co-ordinates map to every 2D point
- w=0 represents a point at infinity
- usually take the inverse transform to be:  $(x, y) \equiv (x, y, 1)$

# Matrices in homogeneous co-ordinates

#### + scale

about origin, factor m

$\begin{bmatrix} x' \end{bmatrix}$		$\lceil m \rceil$	0	0	$\begin{bmatrix} x \end{bmatrix}$
У'	=	0	т	0	У
_w'_		0	0	1	W

#### + do nothing

identity

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

• about origin, angle  $\theta$ 

$\begin{bmatrix} x' \end{bmatrix}$	$\int \cos \theta$	$-\sin\theta$	0	$\begin{bmatrix} x \end{bmatrix}$
y' =	$= \sin \theta$	$\cos\theta$	0	У
_w'_	0	0	1	$\lfloor w \rfloor$

#### 🔶 shear

+ rotate

• parallel to x axis, factor a  $\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & a & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$ 

### **Translation by matrix algebra**

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & 0 & x_o \\ 0 & 1 & y_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

In homogeneous coordinates

$$x' = x + wx_o \qquad \qquad y' = y + wy_o \qquad \qquad w' = w$$

In conventional coordinates

$$\frac{x'}{w'} = \frac{x}{w} + x_0 \qquad \qquad \frac{y'}{w'} = \frac{y}{w} + y_0$$

# **Concatenating transformations**

- often necessary to perform more than one transformation on the same object
- can concatenate transformations by multiplying their matrices e.g. a shear followed by a scaling:

# Transformation are not commutative

 be careful of the order in which you concatenate transformations

# Scaling about an arbitrary point

scale by a factor *m* about point (x<sub>o</sub>,y<sub>o</sub>)
translate point (x<sub>o</sub>,y<sub>o</sub>) to the origin
scale by a factor *m* about the origin
translate the origin to (x<sub>o</sub>,y<sub>o</sub>)

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & 0 & -x_o \\ 0 & 1 & -y_o \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix} \qquad 2 \begin{bmatrix} x'' \\ y'' \\ w'' \end{bmatrix} = \begin{bmatrix} m & 0 & 0 \\ 0 & m & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x' \\ y' \\ w' \end{bmatrix}$$

$$\begin{bmatrix} x''' \\ y''' \\ w''' \end{bmatrix} = \begin{bmatrix} 1 & 0 & x_o \\ 0 & 1 & y_o \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} m & 0 & 0 \\ 0 & m & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & -x_o \\ 0 & 1 & -y_o \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

$$\begin{bmatrix} x''' \\ y''' \\ w''' \end{bmatrix} = \begin{bmatrix} 1 & 0 & x_o \\ 0 & 1 & y_o \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x'' \\ y'' \\ w'' \end{bmatrix}$$

Exercise: show how to perform rotation about an arbitrary point

# **3D transformations**

# ◆ 3D homogeneous co-ordinates (x, y, z, w) → (<sup>x</sup>/<sub>w</sub>, <sup>y</sup>/<sub>w</sub>, <sup>z</sup>/<sub>w</sub>)

#### 3D transformation matrices

translation	identity	rotation about <i>X</i> -axis
$\begin{bmatrix} 1 & 0 & 0 & t_x \end{bmatrix}$	$\begin{bmatrix} 1 & 0 & 0 \end{bmatrix}$	$\begin{bmatrix} 1 & 0 & 0 & 0 \end{bmatrix}$
$\begin{bmatrix} 0 & 1 & 0 & t_y \end{bmatrix}$	0 1 0 0	$0 \cos\theta - \sin\theta = 0$
$\begin{bmatrix} 0 & 0 & 1 & t_z \end{bmatrix}$	0 0 1 0	$0  \sin \theta  \cos \theta  0$
scale	rotation about <i>Z</i> -axis	rotation about <i>y</i> -axis
$\begin{bmatrix} m_x & 0 & 0 & 0 \end{bmatrix}$	$\begin{bmatrix} \cos \theta & -\sin \theta & 0 \end{bmatrix}$	$\begin{bmatrix} \cos\theta & 0 & \sin\theta & 0 \end{bmatrix}$
$\begin{bmatrix} 0 & m_y & 0 & 0 \end{bmatrix}$	$\sin\theta$ $\cos\theta$ 0 0	0 1 0 0
$\begin{vmatrix} 0 & 0 & m_z & 0 \end{vmatrix}$	0 0 1 0	$-\sin\theta  0  \cos\theta  0$

### 3D transformations are not commutative

the graphics package Open Inventor defines a cylinder to be:

- centre at the origin, (0,0,0)
- radius 1 unit
- height 2 units, aligned along the y-axis
- this is the only cylinder that can be drawn, but the package has a complete set of 3D transformations
- we want to draw a cylinder of:
  - radius 2 units
  - the centres of its two ends located at (1,2,3) and (2,4,5)
    - Its length is thus 3 units
- what transforms are required?
  - and in what order should they be applied?

125

+ rotation is a multi-step process

- break the rotation into steps, each of which is rotation about a principal axis
- work these out by taking the desired orientation back to the original axis-aligned position
  - the centres of its two ends located at (1,2,3) and (2,4,5)
- desired axis: (2,4,5)–(1,2,3) = (1,2,2)

original axis: y-axis = (0,1,0)

- desired axis: (2,4,5)-(1,2,3) = (1,2,2)
- original axis: y-axis = (0,1,0)
- zero the z-coordinate by rotating about the x-axis

then zero the x-coordinate by rotating about the z-axis
we now have the object's axis pointing along the y-axis

$$\mathbf{R}_{2} = \begin{bmatrix} \cos \varphi & -\sin \varphi & 0 & 0\\ \sin \varphi & \cos \varphi & 0 & 0\\ 0 & 0 & 1 & 0\\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\varphi = \arcsin \frac{1}{\sqrt{1^{2} + \sqrt{8}^{2}}}$$

$$(0, \sqrt{1^{2} + \sqrt{8}^{2}}, 0) = (0, 3, 0)$$

$$(0, \sqrt{1^{2} + \sqrt{8}^{2}}, 0) = (0, 3, 0)$$

+ the overall transformation is:

- first scale
- then take the inverse of the rotation we just calculated
- finally translate to the correct position

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \mathbf{T} \times \mathbf{R}_1^{-1} \times \mathbf{R}_2^{-1} \times \mathbf{S} \times \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}$$

# **Application: display multiple instances**

 transformations allow you to define an object at one location and then place multiple instances in your scene

#### **Geometry of perspective projection**

### **Projection as a matrix operation**

This is useful in the *z*-buffer algorithm where we need to interpolate 1/z values rather than *z* values.

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

remember  $\begin{vmatrix} x \\ y \\ z \end{vmatrix} \rightarrow \begin{bmatrix} x/w \\ y/w \\ z/w \end{bmatrix}$ 

# Perspective projection with an arbitrary camera

- we have assumed that:
  - screen centre at (0,0,d)
  - screen parallel to xy-plane
  - *z*-axis into screen
  - y-axis up and x-axis to the right
  - eye (camera) at origin (0,0,0)
- for an arbitrary camera we can either:
  - work out equations for projecting objects about an arbitrary point onto an arbitrary plane
  - transform all objects into our standard co-ordinate system (viewing co-ordinates) and use the above assumptions

# A variety of transformations

- the modelling transform and viewing transform can be multiplied together to produce a single matrix taking an object directly from object co-ordinates into viewing co-ordinates
- either or both of the modelling transform and viewing transform matrices can be the identity matrix
  - e.g. objects can be specified directly in viewing co-ordinates, or directly in world co-ordinates
- this is a useful set of transforms, not a hard and fast model of how things should be done

#### + the problem:

 to transform an arbitrary co-ordinate system to the default viewing co-ordinate system

+ camera specification in world co-ordinates

- eye (camera) at  $(e_x, e_y, e_z)$
- look point (centre of screen) at  $(l_x, l_y, l_z)$
- up along vector  $(u_x, u_y, u_z)$

perpendicular to el

• translate eye point,  $(e_x, e_y, e_z)$ , to origin, (0, 0, 0)

$$\mathbf{T} = \begin{bmatrix} 1 & 0 & 0 & -e_x \\ 0 & 1 & 0 & -e_y \\ 0 & 0 & 1 & -e_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

scale so that eye point to look point distance,  $|\mathbf{el}|$ , is distance from origin to screen centre, *d*

$$\overline{\mathbf{el}} = \sqrt{(l_x - e_x)^2 + (l_y - e_y)^2 + (l_z - e_z)^2} \qquad \mathbf{S} = \begin{bmatrix} \frac{d}{|\mathbf{el}|} & 0 & 0 & 0\\ 0 & \frac{d}{|\mathbf{el}|} & 0 & 0\\ 0 & 0 & \frac{d}{|\mathbf{el}|} & 0\\ 0 & 0 & 0 & 1 \end{bmatrix}$$

- $\bullet$  need to align line **el** with *z*-axis
  - first transform e and l into new co-ordinate system

 $\mathbf{e}^{\prime\prime} = \mathbf{S} \times \mathbf{T} \times \mathbf{e} = \mathbf{0}$   $\mathbf{l}^{\prime\prime} = \mathbf{S} \times \mathbf{T} \times \mathbf{l}$ 

• then rotate e''l'' into yz-plane, rotating about y-axis

$$\mathbf{R}_{1} = \begin{bmatrix} \cos\theta & 0 & -\sin\theta & 0 \\ 0 & 1 & 0 & 0 \\ \sin\theta & 0 & \cos\theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \qquad (0, l''_{x}, \sqrt{l''_{x}}^{2} + l''_{z})^{2}$$

$$\theta = \arccos \frac{l''_{z}}{\sqrt{l''_{x}}^{2} + l''_{z}^{2}}$$

 having rotated the viewing vector onto the yz plane, rotate it about the x-axis so that it aligns with the z-axis

$$\mathbf{l}^{\prime\prime\prime\prime} = \mathbf{R}_1 \times \mathbf{l}^{\prime\prime}$$

the final step is to ensure that the up vector actually points up,
 i.e. along the positive y-axis

actually need to rotate the up vector about the z-axis so that it lies in the positive y half of the yz plane

$$\mathbf{u}^{\prime\prime\prime\prime\prime} = \mathbf{R}_2 \times \mathbf{R}_1 \times \mathbf{u}$$

$$\mathbf{R}_{3} = \begin{bmatrix} \cos \psi & -\sin \psi & 0 & 0 \\ \sin \psi & \cos \psi & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$
$$\psi = \arccos \frac{u'''_{y}}{\sqrt{u'''_{x}}^{2} + u'''_{y}}$$

why don't we need to multiply **u** by **S** or **T**?

u is a vector rather than a point, vectors do not get translated

scaling **u** by a uniform scaling matrix would make no difference to the direction in which it points

 we can now transform any point in world co-ordinates to the equivalent point in viewing co-ordinate

$$\begin{bmatrix} x'\\y'\\z'\\w' \end{bmatrix} = \mathbf{R}_3 \times \mathbf{R}_2 \times \mathbf{R}_1 \times \mathbf{S} \times \mathbf{T} \times \begin{bmatrix} x\\y\\z\\w \end{bmatrix}$$

- in particular:  $\mathbf{e} \rightarrow (0,0,0) \quad \mathbf{l} \rightarrow (0,0,d)$
- the matrices depend only on e, l, and u, so they can be premultiplied together

$$\mathbf{M} = \mathbf{R}_3 \times \mathbf{R}_2 \times \mathbf{R}_1 \times \mathbf{S} \times \mathbf{T}$$

# **Illumination & shading**

- + Drawing polygons with uniform colours gives poor results
- Interpolate colours across polygons

# **Illumination & shading**

+Interpolating colours across polygons needs

- colour at each vertex
- algorithm to blend between the colours across the polygon
- +Works for ambient lighting and diffuse reflection
- Specular reflection requires more information than just the colour

# Gouraud shading

- for a polygonal model, calculate the diffuse illumination at each vertex
  - calculate the normal at the vertex, and use this to calculate the diffuse illumination at that point
  - normal can be calculated directly if the polygonal model was derived from a curved surface
- interpolate the colour between the vertices across the polygon
- surface will look smoothly curved
  - rather than looking like a set of polygons
  - surface outline will still look polygonal

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Henri Gouraud, "Continuous Shading of Curved Surfaces", *IEEE Trans Computers*, 20(6), 1971

# Flat vs Gouraud shading

 note how the interior is smoothly shaded but the outline remains polygonal

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson http://computer.howstuffworks.com/question484.htm

# Phong shading

- similar to Gouraud shading, but calculate the specular component in addition to the diffuse component
- therefore need to interpolate the *normal* across the polygon in order to be able to calculate the reflection vector

 N.B. Phong's approximation to specular reflection ignores (amongst other things) the effects of glancing incidence

## Surface detail

- so far we have assumed perfectly smooth, uniformly coloured surfaces
- real life isn't like that:
  - multicoloured surfaces
    - e.g. a painting, a food can, a page in a book
  - bumpy surfaces
    - e.g. almost any surface! (very few things are perfectly smooth)
  - textured surfaces
    - e.g. wood, marble

## **Texture mapping**

#### without

## all surfaces are smooth and of uniform colour

with

most surfaces are textured with 2D texture maps the pillars are textured with a solid texture

## **Basic texture mapping**

a texture is simply an image,
 with a 2D coordinate system
 (u,v)

- each 3D object is parameterised
  in (u,v) space
- each pixel maps to some part of the surface
- that part of the surface maps to part of the texture

## **Paramaterising a primitive**

polygon: give (u,v)
 coordinates for three
 vertices, or treat as part of
 a plane

 plane: give *u*-axis and *v*-axis directions in the plane

 cylinder: one axis goes up the cylinder, the other around the cylinder

## Sampling texture space

"Texture space"

Object (on screen)

Find (u,v) coordinate of the sample point on the object and map this into texture space

Sample texture space to determine the pixel's colour

## Sampling texture space: finding the value<sup>153</sup>

Nearest neighbour: the sample value is the nearest pixel value to the sample point.

**Bi-linear**: the sample value is the weighted mean of the four pixels around the sample point.

Bi-cubic (not shown): the sample value is the weighted mean of the sixteen Complited Graphics & the sample point 2014 (c) # 996 2014 Netl & BBB and the sample point 2014 (c) # 996 2014 Netl & BBB and the sample point 2014 (c) # 996 2014 Netl & BBB and the sample point 2014 (c) # 996 2014 Netl & BBB and the sample point 2014 (c) # 996 2014 Netl & BBB and the sample point 2014 (c) # 996 2014 Netl & BBB and the sample point 2014 (c) # 996 2014 Netl & BBB and the sample point 2014 Netl & BBB

Computer Graphics & Image Processing 2014 (1998) 2014 A to the heiter Doligion hapdt competed image to compare the two interpolation methods

nearest-

neighbour

blocky

artefacts

**Up-sampling** 

- + if one pixel in the texture map covers several pixels in the final image, you get visible artefacts
- only practical way to prevent this is to ensure that texture map is of sufficiently high resolution that it does not happen

bicubic

blurry artefacts

## **Down-sampling**

 if the pixel covers quite a large area of the texture, then it will be necessary to average the texture across that area, not just take a sample in the middle of the area

## **Down-sampling**

#### without area averaging

#### with area averaging

## **Multi-resolution texture**

- rather than down-sampling when necessary, pre-calculate multiple versions of the texture at different resolutions and pick the appropriate resolution to sample from...
- can use tri-linear interpolation to get an even better result: that is, use bi-linear interpolation in the two nearest levels and then linearly interpolate between the two interpolated values

## The MIP map

- An efficient memory arrangement for a multiresolution colour image
- pixel (x,y) is a bottom level pixel location (level 0);
  for an image of size (m,n), it is stored at these
  locations in level k:

$$\left(\left\lfloor\frac{m+x}{2^{k}}\right\rfloor, \left\lfloor\frac{y}{2^{k}}\right\rfloor\right)$$
$$\left(\left\lfloor\frac{x}{2^{k}}\right\rfloor, \left\lfloor\frac{n+y}{2^{k}}\right\rfloor\right)$$
$$\left(\left\lfloor\frac{m+x}{2^{k}}\right\rfloor, \left\lfloor\frac{n+y}{2^{k}}\right\rfloor\right)$$
Blue Green

## What can a texture map modify?

+any (or all) of the colour components

ambient, diffuse, specular

transparency

- "transparency mapping"
- reflectiveness

but also the surface normal
 "bump mapping"

## **Bump mapping**

- the surface normal is used in calculating both diffuse and specular reflection
- bump mapping modifies the direction of the surface normal so that the surface appears more or less bumpy
- rather than using a texture map, a 2D function can be used which varies the surface normal smoothly across the plane
- but bump mapping doesn't change the object's outline

## **Graphics card architecture**

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson based on nVIDIA's GeForce 6 architecture

## **OpenGL** architecture

## **OpenGL** in Java

```
public class MyCanvas extends GLCanvas implements GLEventListener {
   public void init (GLAutoDrawable drawable) {
   // Build model in buffers
   // Compile and link shaders
    }
   public void display (GLAutoDrawable drawable) {
   // Update transformations
   // Draw
    }
   public void dispose (GLAutoDrawable drawable) { ... }
   public void reshape (GLAutoDrawable drawable,
          int x, int y, int width, int height) { ... }
```

## **OpenGL shaders**

#### + Compute

- + Vertex
  - Receives coordinates, colour and transformations
  - Applies model and view transformations to vertices
  - Outputs transformed coordinates and colour
- Tessellation control and evaluation
- + Geometry

### + Fragment

- Receives interpolated values from vertex shader
- Calculates lighting and shading for each visible pixel
- Outputs fragment colour

## **OpenGL Shading Language**

#### Vertex shader

- Uniform inputs per object e.g. transformations
- in inputs per vertex e.g. position and colour
- applies transformations to vertices
- OUt outputs per vertex will be interpolated across a face

#### + Fragment shader

- *in* inputs interpolated between vertices
- calculates lighting and shading
- outputs gl\_FragColor for pixel

## **Computer Graphics & Image Processing**

- + Background
- + Simple rendering
- + Graphics pipeline
- Underlying algorithms
  - Drawing lines, curves and polygons in 2D
  - Clipping
  - 3D scan conversion
- + Colour and displays
- +Image processing

## Drawing a straight line

- a mathematical line is "length without breadth"
- a computer graphics line is a set of pixels
- which pixels do we need to turn on to draw a given line? Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

## Which pixels do we use?

there are two reasonably sensible alternatives:

every pixel through which the line passes

for lines of slope less than 45° we can have either one or two pixels in each column

the "closest" pixel to the line in each column

for lines of slope less than 45° we always have just one pixel in every column

## A line drawing algorithm — preparation 1

+ pixel (x,y) has its centre at real co-ordinate (x,y)

• it thus stretches from  $(x-\frac{1}{2}, y-\frac{1}{2})$  to  $(x+\frac{1}{2}, y+\frac{1}{2})$ 

Beware: not every graphics system uses this convention. Some put real complitience (app) constant maber to meselfing from a complete for the pixebodgs on & Peter Robinson

## A line drawing algorithm — preparation 2

- + the line goes from  $(x_0,y_0)$  to  $(x_1,y_1)$
- + the line lies in the first octant  $(0 \le m \le 1)$

## Bresenham's line drawing algorithm for <sup>174</sup> integer end points

Initialisation

Iteration

J. E. Bresenham, Algorithm for Processing 2014 (f) 1996-2014 Neil A Dodgs BN/S Jstern S. Potinso, 4(1), 1965

## Bresenham's algorithm for floating point <sup>175</sup> end points

We need to calculate the initial y from the rounded off initial position of  $x_0$  because we will not necessarily get the right answer by rounding  $x_0$  and  $y_0$  independently. Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Splitting the y-coordinate into fractional (yf) and integer (y) parts avoids rounding on every cycle.

## **Bresenham's algorithm — more details**

+we assumed that the line is in the first octant

can do fifth octant by swapping end points

+ therefore need four versions of the algorithm

## A second line drawing algorithm

+a line can be specified using an equation of the form:

$$k(x, y) = ax + by + c$$

For a line segment from  $(x_0,y_0)$  to  $(x_1,y_1)$ , the line is defined by:  $a=y_1-y_0$ 

 $c = x_1 y_0 - x_0 y_1$ 

+ this divides the plane into three regions:

- above the line k < 0
- below the line k > 0
- on the line k = 0

## Midpoint line drawing algorithm 1

+ first work out the iterative step

- it is often easier to work out what should be done on each iteration and only later work out how to initialise and terminate the iteration
- fiven that a particular pixel is on the line,
  the next pixel must be either immediately to the right
  (E) or to the right and up one (NE)

# use a decision variable (based on k) to determine which way to go

This is the current pixel Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson if < 0 then go E Midpoint line drawing algorithm 2 + decision variable needs to make a decision at point  $(x+1, y+\frac{1}{2})$  $d = a(x+1) + b(y+\frac{1}{2}) + c$ 

+ if go E then the new decision variable is at  $(x+2, y+\frac{1}{2})$   $d' = a(x+2) + b(y + \frac{1}{2}) + c$ = d + a

## Midpoint line drawing algorithm 3

#### Initialisation

## Midpoint — comments

+ this version only works for lines in the first octant

- extend to other octants as for Bresenham
- it is not immediately obvious that Bresenham and Midpoint give identical results, but it can be proven that they do
- Midpoint algorithm can be generalised to draw arbitrary circles & ellipses
  - Bresenham can only be generalised to draw circles with integer radii

## Curves

#### + circles & ellipses

#### Bézier cubics

- Pierre Bézier, worked in CAD for Renault
- de Casteljau invented them five years earlier at Citroën
  - but Citroën would not let him publish the results
- widely used in graphic design & typography

#### + NURBS

- Non-Uniform Rational B-Splines
- more powerful than Bezier & now more widely used
- consider these in Part II

## Midpoint circle algorithm 1

+ equation of a circle is  $x^2 + y^2 = r^2$ centred at the origin

decision variable can be

$$d = x^2 + y^2 - r^2$$

**d** = 0 on the circle, d > 0 outside, d < 0 inside

+ divide circle into eight octants

on the next slide we consider only the second octant, the others are similar

## Midpoint circle algorithm 2

+ decision variable needed to make a decision at point  $(x+1, y-\frac{1}{2})$ 

$$d = (x+1)^{2} + (y - \frac{1}{2})^{2} - r^{2}$$

+ if go E then the new decision variable is  
at 
$$(x+2, y-\frac{1}{2})$$
  
 $d' = (x+2)^2 + (y-\frac{1}{2})^2 - r^2$   
 $= d + 2x + 3$ 

+ if go SE then the new decision variable is at  $(x+2, y-1\frac{1}{2})$  $d' = (x+2)^2 + (y-1\frac{1}{2})^2 - r^2$ = d+2x-2y+5

## Midpoint circle algorithm 3

+ Drawing an origin-centred circle in all eight octants

## Taking circles further

the algorithm can be easily extended to circles not centred at the origin

- a similar method can be derived for ovals
  - but: cannot naively use octants
    - use points of 45° slope to divide oval into eight sections
  - and: ovals must be axis-aligned

there is a more complex algorithm which can be used for non-axis aligned ovals

## Are circles & ellipses enough?

simple drawing packages use ellipses & segments of

 for graphic design & CAD need something with more flexibility

- use cubic polynomials
  - Iower orders (linear, quadratic) cannot:
    - have a point of inflection
    - \* match both position and slope at both ends of a segment
    - & be non-planar in 3D
  - higher orders (quartic, quintic,...):
    - \* can wiggle too much

## Hermite cubic

◆ the Hermite form of the cubic is defined by its two end-points and by the tangent vectors at these end-points:
 P(t) = (2t<sup>3</sup> - 3t<sup>2</sup> + 1)P<sub>0</sub>

 $+(-2t^{3}+3t^{2})P_{1} +(t^{3}-2t^{2}+t)T_{0} +(t^{3}-t^{2})T_{1}$ 

 $T_1$ 

 $T_0$ 

 two Hermite cubics can be smoothly joined by matching both position and tangent at an end point of each cubic

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Charles Hermite, mathematician, 1822–1901

#### **Bézier cubic**

difficult to think in terms of tangent vectors
 Bézier defined by two end points and two other control points

$$P(t) = (1-t)^{3} P_{0}$$

$$+ 3t(1-t)^{2} P_{1}$$

$$+ 3t^{2}(1-t)P_{2}$$

$$+ t^{3} P_{3}$$
where:  $P_{i} \equiv (x_{i}, y_{i})$ 

$$0 \le t \le 1$$
Computer Graphics & Image Processing 2014 (c) 1996-2014 Weil A Dodgson & Peter Robinson

Pierre Bézier worked for Renault in the 1960s

## **Bezier properties**

+ Bezier is equivalent to Hermite

$$T_0 = 3(P_1 - P_0)$$
  $T_1 = 3(P_3 - P_2)$ 

★ Weighting functions are Bernstein polynomials  $b_0(t) = (1-t)^3 \quad b_1(t) = 3t(1-t)^2 \quad b_2(t) = 3t^2(1-t) \quad b_3(t) = t^3$ 

Weighting functions sum to one

$$\sum_{i=0}^{3} b_i(t) = 1$$

+ Bezier curve lies within convex hull of its control points

because weights sum to 1 and all weights are non-negative

# Types of curve join

each curve is smooth within itself

#### + joins at endpoints can be:

- $C_1$  continuous in both position and tangent vector
  - smooth join in a mathematical sense
- G<sub>1</sub> continuous in position, tangent vector in same direction
   smooth join in a geometric sense
- $C_0$  continuous in position only
  - "corner"
- discontinuous in position

 $C_n$  (mathematical continuity): continuous in all derivatives up to the  $n^{th}$  derivative

 $G_n$  (geometric continuity): each derivative up to the  $n^{th}$  has the same "direction" to its vector on either side of the join

Configure Computer Co

## Drawing a Bezier cubic – iterative method

 draw as a set of short line segments equispaced in parameter space, t

```
(x0,y0) = Bezier(0)
FOR t = 0.05 TO 1 STEP 0.05 DO
(x1,y1) = Bezier(t)
DrawLine((x0,y0), (x1,y1))
(x0,y0) = (x1,y1)
END FOR
```

#### problems:

- cannot fix a number of segments that is appropriate for all possible Beziers: too many or too few segments
- distance in real space, (x,y), is not linearly related to distance in parameter space, t

## Drawing a Bezier cubic – adaptive method

- +adaptive subdivision
  - $\blacklozenge$  check if a straight line between  $P_0$  and  $P_3$  is an adequate approximation to the Bezier
  - if so: draw the straight line
  - if not: divide the Bezier into two halves, each a Bezier, and repeat for the two new Beziers
- need to specify some tolerance for when a straight line is an adequate approximation
  - when the Bezier lies within half a pixel width of the straight line along its entire length

## Drawing a Bezier cubic (continued)

## **Checking for flatness**

198

#### **Special cases**

+ if s < 0 or s > 1 then the distance from point C to the line segment  $\overrightarrow{AB}$  is not the same as the distance from point C to the infinite line  $\overrightarrow{AB}$ 

+ in these cases the distance is |AC| or |BC| respectively

## Subdividing a Bezier cubic into two halves

 a Bezier cubic can be easily subdivided into two smaller Bezier cubics

 $\begin{array}{ll} Q_0 = P_0 & R_0 = \frac{1}{8}P_0 + \frac{3}{8}P_1 + \frac{3}{8}P_2 + \frac{1}{8}P_3 \\ Q_1 = \frac{1}{2}P_0 + \frac{1}{2}P_1 & R_1 = \frac{1}{4}P_1 + \frac{1}{2}P_2 + \frac{1}{4}P_3 \\ Q_2 = \frac{1}{4}P_0 + \frac{1}{2}P_1 + \frac{1}{4}P_2 & R_2 = \frac{1}{2}P_2 + \frac{1}{2}P_3 \\ Q_3 = \frac{1}{8}P_0 + \frac{3}{8}P_1 + \frac{3}{8}P_2 + \frac{1}{8}P_3 & R_3 = P_3 \end{array}$ 

Exercise: prove that the Bezier cubic curves defined by  $Q_0$ ,  $Q_1$ ,  $Q_2$ ,  $Q_3$  and  $R_0$ ,  $R_1$ ,  $R_2$ ,  $R_3$  match the Bezier cubic curve defined by  $P_0$ ,  $P_1$ ,  $P_2$ ,  $P_3$  over the ranges  $t \in [0, \frac{1}{2}]$  and  $t \in [\frac{1}{2}, 1]$  respectively

## The effect of different tolerances

this is the same Bezier curve drawn with four different tolerances

## What if we have no tangent vectors?

base each cubic piece on the four surrounding data points

- at each data point the curve must depend solely on the three surrounding data points
   Why?
  - define the tangent at each point as the direction from the preceding point to the succeeding point

• tangent at  $P_1$  is  $\frac{1}{2}(P_2 - P_0)$ , at  $P_2$  is  $\frac{1}{2}(P_3 - P_1)$ 

this is the basis of Overhauser's cubic

#### **Overhauser's cubic**

- method for generating Bezier curves which match Overhauser's model
  - simply calculate the appropriate Bezier control point locations from the given points
    - e.g. given points A, B, C, D, the Bezier control points are:  $P_0=B$   $P_1=B+(C-A)/6$

 $P_3 = C$   $P_2 = C - (D - B)/6$ 

- Overhauser's cubic *interpolates* its controlling data points
  - good for control of movement in animation
  - not so good for industrial design because moving a single point modifies the surrounding four curve segments
    - compare with Bezier where moving a single point modifies just the two segments connected to that point

## Simplifying line chains

 this can be thought of as an inverse problem to the one of drawing Bezier curves

- problem specification: you are given a chain of line segments at a very high resolution, how can you reduce the number of line segments without compromising quality
  - e.g. given the coastline of Britain defined as a chain of line segments at one metre resolution, draw the entire outline on a 1280×1024 pixel screen
- the solution: Douglas & Peucker's line chain simplification algorithm

This can also be applied to chains of Bezier curves at high resolution: most of the curves will each be approximated (by the previous algorithm) as a single line segment, Douglas & Peucker's algorithm can then be used to further simplify the line chain Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

#### **Douglas & Peucker's algorithm**

- find point, C, at greatest distance from line segment AB
- if distance from C to AB is more than some specified tolerance then subdivide into AC and CB, repeat for each of the two subdivisions
- otherwise approximate entire chain from A to B by the single line segment AB

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Douglas & Peucker, *Canadian Cartographer*, **10**(2), **1973** 

# Clipping

+ what about lines that go off the edge of the screen?

- need to clip them so that we only draw the part of the line that is actually on the screen
- + clipping points against a rectangle

#### Clipping lines against a rectangle — naïvely

$$P_{1} \text{ to } P_{2} = (x_{1}, y_{1}) \text{ to } (x_{2}, y_{2})$$

$$P(t) = (1-t)P_{1} + tP_{2}$$

$$x(t) = (1-t)x_{1} + tx_{2}$$

$$y(t) = (1-t)y_{1} + ty_{2}$$

This is naïve because a lot of unnecessary operations will be done for most lines. do this operation for each of the four edges

to intersect with  $x = x_L$ if  $(x_1 = x_2)$  then no intersection else  $x_L = (1 - t_L)x_1 + t_L x_2$   $\Rightarrow t_L = \frac{x_L - x_1}{x_2 - x_1}$ if  $(0 \le t_L \le 1)$ then line segment intersects  $x = x_L$  at  $(x(t_L), y(t_L))$ 

else line segment does not intersect edge

#### Clipping lines against a rectangle — examples

you can naïvely check every line against each of the four edges

this works but is obviously inefficient

◆ adding a little cleverness improves efficiency enormously <sup>Computer</sup> Craphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

#### **Cohen-Sutherland clipper 1**

• make a four bit code, one bit for each inequality  $A \equiv x < x_L$   $B \equiv x > x_R$   $C \equiv y < y_B$   $D \equiv y > y_T$ 

evaluate this for both endpoints of the line

$$Q_1 = A_1 B_1 C_1 D_1$$
  $Q_2 = A_2 B_2 C_2 D_2$ 

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Ivan Sutherland is one of the founders of Evans & Sutherland, manufacturers of flight simulator systems

## **Cohen-Sutherland clipper 2**

#### • $Q_1 = Q_2 = 0$

both ends in rectangle ACCEPT

•  $Q_1 \land Q_2 \neq 0$ 

both ends outside and in same half-plane REJECT

otherwise

- need to intersect line with one of the edges and start again
  - you must always re-evaluate Q and recheck the above tests after doing a single clip
- the I bits tell you which edge to clip against

## **Cohen-Sutherland clipper 3**

- if code has more than a single 1 then you cannot tell which is the best: simply select one and loop again
- horizontal and vertical lines are not a problem
- need a line drawing algorithm that can cope with floating-point endpoint co-ordinates
   Why?

Exercise: what happens in each of the cases at left? [Assume that, where there is a choice, the algorithm always tries to intersect with  $x_L$  or  $x_R$  before  $y_B$  or  $y_T$ .] Try some other cases of your own

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Doogson & Peter Robinson

Why not?

## **Polygon filling**

#### + which pixels do we turn on?

those whose *centres* lie inside the polygon
this is a naïve assumption, but is sufficient for now

# Scanline polygon fill algorithm

- take all polygon edges and place in an edge list (EL), sorted on lowest y value
- 2 start with the first scanline that intersects the polygon, get all edges which intersect that scan line and move them to an *active edge list (AEL*)
- 3 for each edge in the AEL: find the intersection point with the current scanline; sort these into ascending order on the *X* value
- **4** fill between pairs of intersection points
- Some to the next scanline (increment y); move new edges from EL to AEL if start point  $\leq y$ ; remove edges from the AEL if endpoint < y; if any edges remain in the AEL go back to step 3

#### Scanline polygon fill example

## Scanline polygon fill details

- how do we efficiently calculate the intersection points?
  - use a line drawing algorithm to do incremental calculation
  - store current x value, increment value dx, starting and ending y values
  - on increment do a single addition x=x+dx
- what if endpoints exactly intersect scanlines?
  - need to ensure that the algorithm handles this properly
- what about horizontal edges?
  - can throw them out of the edge list, they contribute nothing

## **Clipping polygons**

## Sutherland-Hodgman polygon clipping 1

- clips an arbitrary polygon against an arbitrary *convex* polygon
  - basic algorithm clips an arbitrary polygon against a single infinite clip edge
    - so we reduce a complex algorithm to a simpler one which we call recursively
  - the polygon is clipped against one edge at a time, passing the result on to the next stage

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Sutherland & Hodgman, "Reentrant Polygon Clipping," *Comm. ACM*, **17**(1), 1974

## Sutherland-Hodgman polygon clipping 2

 the algorithm progresses around the polygon checking if each edge crosses the clipping line and outputting the appropriate points

Exercise: the Sutherland-Hodgman algorithm may introduce new edges along the edge of the clipping polygon — when does this happen and why?

## Sutherland-Hodgman polygon clipping 3

- line segment defined by  $(x_s, y_s)$  and  $(x_{\rho}, y_{\rho})$
- line segment is: p(t) = (1-t)s+te
- $\bullet$  clipping edge defined by ax+by+c=0
- $\diamond$  test to see which side of edge S and e are on:
  - $\blacksquare k=ax+by+c$
  - $\blacksquare$  k negative: inside, k positive: outside, k=0: on edge
- $\bullet$  if  $k_s$  and  $k_{\rho}$  differ in sign then intersection point can be found by:  $a((1-t)x_{s} + tx_{e}) + b((1-t)y_{s} + ty_{e}) + c = 0$  $\Rightarrow t = \frac{ax_s + by_s + c}{a(x - x_s) + b(y_s - y_s)}$

## **Bounding boxes**

 when working with complex objects, bounding boxes can be used to speed up some operations

### **Clipping with bounding boxes**

 do a quick *acceptl rejectl unsure* test to the bounding box then apply clipping to only the *unsure* objects

*otherwise*  $\Rightarrow$  clip at next higher level of detail

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# **Clipping Bézier curves**

If flat  $\Rightarrow$  draw using clipped line drawing algorithm Else consider the Bézier's bounding box

 $accept \Rightarrow draw using normal (unclipped) Bézier algorithm$ 

*reject* 
$$\Rightarrow$$
 do not draw at all

*unsure*  $\Rightarrow$  split into two Béziers, recurse

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# **Object inclusion with bounding boxes**

 including one object (e.g. a graphics) file inside another can be easily done if bounding boxes are known and used

use the eight values to translate and scale the original to the appropriate position in the destination document

# Bit block transfer (BitBlT)

 it is sometimes preferable to predraw something and then copy the image to the correct position on the screen as and when required

- copying an image from place to place is essentially a memory operation
  - can be made very fast
  - e.g. 32×32 pixel icon can be copied, say, 8 adjacent pixels at a time, if there is an appropriate memory copy operation

# **Application 1: user interface**

- early graphical userinterfaces needed to use objects that were quick to draw
  - straight lines
  - filled rectangles
- complicated bits were done using predrawn icons
- typefaces also tended to be predrawn

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# Application 2: typography

- typeface: a family of letters designed to look good together
  - usually has upright (roman/regular), italic (oblique), bold and bold-italic members

abcd *efgh* **ijkl** *mnop* – Gill Sans abcd *efgh* **ijkl** *mnop* – Arial abcd *efgh* **ijkl** *mnop* – Times abcd *efgh* **ijkl** *mnop* – Garamond

226

- two forms of typeface used in computer graphics
  - pre-rendered bitmaps
    - single resolution (don't scale well)
    - use BitBIT to put into frame buffer
  - outline definitions
    - multi-resolution (can scale)
    - need to render (fill) to put into frame buffer

These notes are mainly set in Gill Sans, a lineale (sans-serif) typeface designed by Eric Gill for Monotype, 1928–30. The lowercase italic *p* is particularly interesting. Mathematics is mainly set in Times New Roman, a roman typeface commissioned by raphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson *The Times* in 1931, the design supervised by Stanley Morison.

# **Application 3: Postscript**

- industry standard rendering language for printers
- developed by Adobe Systems
- stack-based interpreted language
- basic features
  - object outlines made up of lines, arcs & Bezier curves
  - objects can be *filled* or *stroked*
  - whole range of 2D transformations can be applied to objects
  - typeface handling built in
    - typefaces are defined using Bezier curves
  - halftoning
  - can define your own functions in the language

#### **Examples which are Bezier-friendly**

typeface: Utopia (1989) typ designed as a Postscript typeface by thi

#### typeface: Hobo (1910)

this typeface can be easily

CoRedberrershinebaten Parcaselogber (c) 1996-2014 Neippressinna Reter By Beziers

#### **Examples which are more fussy**

typeface: Helvetica (1957) typeface: Palatino (1950) Comator Comore Regr 234 5&14 (c) 1996-2014 Neighbord Regr 701345&

#### **Curves in 3D**

 same as curves in 2D, with an extra co-ordinate for each point

♦ e.g. Bezier cubic in 3D:  $P(t) = (1-t)^{3} P_{0}$   $+ 3t(1-t)^{2} P_{1}$   $+ 3t^{2}(1-t)P_{2}$   $+ t^{3} P_{3}$ P<sub>0</sub>

where:  $P_i \equiv (x_i, y_i, z_i)$ 

### Surfaces in 3D: patches

+ curves generalise to patches

 a Bezier patch has a Bezier curve running along each of its four edges and four extra internal control points

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

#### **Bezier patch definition**

• the Bezier patch defined by the sixteen control points,  $P_{0,0}$ ,  $P_{0,1}$ , ...,  $P_{3,3}$ , is:

$$P(s,t) = \sum_{i=0}^{3} \sum_{j=0}^{3} b_i(s)b_j(t)P_{i,j}$$

where:  $b_0(t) = (1-t)^3$   $b_1(t) = 3t(1-t)^2$   $b_2(t) = 3t^2(1-t)$   $b_3(t) = t^3$ 

compare this with the 2D version:

$$P(t) = \sum_{i=0}^{3} b_i(t) P_i$$

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# **Continuity between Bezier patches**

- each patch is smooth within itself
- ensuring continuity in 3D:
  - $C_0$  continuous in position
    - the four edge control points must match
  - $C_1$  continuous in both position and tangent vector
    - the four edge control points must match
    - the two control points on either side of each of the four edge control points must be co-linear with both the edge point and each other and be equidistant from the edge point
  - $G_1$  continuous in position and tangent direction
    - the four edge control points must match
    - the relevant control points must be co-linear
    - Competer piraphice & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

Surface S

 $P_{23}$ 

 $P_{13}$ 

 $P_{13}$ 

 $P_{31}$ 

 $P_{10}$ 

# **Drawing Bezier patches**

- in a similar fashion to Bezier curves, Bezier patches can be drawn by approximating them with planar polygons
- simple method
  - select appropriate increments in s and t and render the resulting quadrilaterals
- tolerance-based adaptive method
  - check if the Bezier patch is sufficiently well approximated by a quadrilateral, if so use that quadrilateral
  - if not then subdivide it into two smaller Bezier patches and repeat on each
    - subdivide in different dimensions on alternate calls to the subdivision function
  - having approximated the whole Bezier patch as a set of (non-planar) quadrilaterals, further subdivide these into (planar) triangles
    - be careful to not leave any gaps in the resulting surface!

#### Subdividing a Bezier patch — example

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

#### Triangulating the subdivided patch

Naïve triangulation

Final quadrilateral mesh

More intelligent triangulation

need to be careful not to generate holes

need to be equally careful when subdividing connected patches

**consider whether it is worth doing this adaptive method** Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

### Viewing volume

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

onto the viewing plane

# Clipping in 3D

#### clipping against a volume in viewing co-ordinates

a point (x,y,z) can be clipped against the pyramid by checking it against four planes:

$$x > -z\frac{a}{d} \qquad x < z\frac{a}{d}$$
$$y > -z\frac{b}{d} \qquad y < z\frac{b}{d}$$

# What about clipping in *z*?

- need to at least check for z <</li>
  0 to stop things behind the camera from projecting onto the screen
- can also have front and back clipping planes:
  - $z > z_f$  and  $z < z_b$ 
    - resulting clipping volume is called the *viewing frustum*

which is

best?

# Clipping in 3D — two methods

#### + clip against the viewing frustum

need to clip against six planes

$$x = -z\frac{a}{d}$$
  $x = z\frac{a}{d}$   $y = -z\frac{b}{d}$   $y = z\frac{b}{d}$   $z = z_f$   $z = z_b$ 

 project to 2D (retaining z) and clip against the axisaligned cuboid

still need to clip against six planes

x = -a x = a y = -b y = b  $z = z_f$   $z = z_b$ 

these are simpler planes against which to clip

• this is equivalent to clipping in 2D with two extra clips for z

#### **Bounding volumes & clipping**

+ can be very useful for reducing the amount of work involved in clipping

+ what kind of bounding volume?

axis aligned box

sphere

#### + can have multiple levels of bounding volume

### **3D** scan conversion

#### + polygons

- depth sort
- Binary Space-Partitioning tree
- ♦ z-buffer
- A-buffer

### **3D line drawing**

• given a list of 3D lines we draw them by:

- projecting end points onto the 2D screen
- using a line drawing algorithm on the resulting 2D lines
- this produces a wireframe version of whatever objects are represented by the lines

#### Hidden line removal

- by careful use of cunning algorithms, lines that are hidden by surfaces can be carefully removed from the projected version of the objects
  - still just a line drawing
  - will not be covered further in this course

# 3D polygon drawing

• given a list of 3D polygons we draw them by:

- projecting vertices onto the 2D screen
  - but also keep the z information
- using a 2D polygon scan conversion algorithm on the resulting 2D polygons
- in what order do we draw the polygons?
  - some sort of order on z
    - depth sort
    - Binary Space-Partitioning tree

# is there a method in which order does not matter? *z*-buffer

#### Depth sort algorithm

- Itransform all polygon vertices into viewing co-ordinates and project these into 2D, keeping z information
- <sup>2</sup> calculate a depth ordering for polygons, based on the most distant z co-ordinate in each polygon
- $\bigcirc$  resolve any ambiguities caused by polygons overlapping in z
- **4** draw the polygons in depth order from back to front
  - "painter's algorithm": later polygons draw on top of earlier polygons
- steps 1 and 2 are simple, step 4 is 2D polygon scan conversion, step 3 requires more thought

### **Resolving ambiguities in depth sort**

 may need to split polygons into smaller polygons to make a coherent depth ordering

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# **Resolving ambiguities: algorithm**

+ for the rearmost polygon, P, in the list, need to compare *each* polygon, Q, which overlaps P in z

- the question is: can I draw P before Q?
  - $\bigcirc$  do the polygons y extents not overlap?
  - 2 do the polygons x extents not overlap?
    - $\mathbf{3}$  is P entirely on the opposite side of Q's plane from the viewpoint?
      - $\bigcirc$  is Q entirely on the same side of P's plane as the viewpoint?
- if all 4 tests fail, repeat  $\[embed{B}$  and  $\[embed{A}$  with P and Q swapped (i.e. can I draw Q before P?), if true swap P and Q
- otherwise split either P or Q by the plane of the other, throw away the original polygon and insert the two pieces into the list

draw rearmost polygon once it has been completely checked

tests get more expensive

# Split a polygon by a plane

- remember the Sutherland-Hodgman algorithm
  - splits a 2D polygon against a 2D line
- do the same in 3D: split a (planar) polygon by a plane
- line segment defined by  $(x_s, y_s, z_s)$  and  $(x_e, y_e, z_e)$
- clipping plane defined by ax+by+cz+d=0
- test to see which side of plane a point is on:
  - $\blacksquare$  k=ax+by+cz+d
  - k negative: inside, k positive: outside, k=0: on edge
  - apply this test to all vertices of a polygon; if all have the same sign then the polygon is entirely on one side of the plane

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

749

#### **Depth sort: comments**

- the depth sort algorithm produces a list of polygons which can be scan-converted in 2D, backmost to frontmost, to produce the correct image
- it is reasonably cheap for small number of polygons, but becomes expensive for large numbers of polygons
- the ordering is only valid from one particular viewpoint

### Back face culling: a time-saving trick

- if a polygon is a face of a closed polyhedron and faces backwards with respect to the viewpoint *then* it need not be drawn at all because front facing faces would later obscure it anyway
  - saves drawing time at the the cost of one extra test per polygon
  - assumes that we know which way a polygon is oriented
- back face culling can be used in combination with any 3D scan-conversion algorithm

# **Binary Space-Partitioning trees**

- BSP trees provide a way of quickly calculating the correct depth order:
  - for a collection of static polygons
  - from an arbitrary viewpoint
- the BSP tree trades off an initial time- and space-intensive preprocessing step against a linear display algorithm (O(N)) which is executed whenever a new viewpoint is specified
- the BSP tree allows you to easily determine the correct order in which to draw polygons by traversing the tree in a simple way

#### **BSP tree: basic idea**

• a given polygon will be correctly scan-converted if:

- all polygons on the far side of it from the viewer are scan-converted first
- then it is scan-converted
- then all the polygons on the near side of it are scan-converted

# Making a BSP tree

given a set of polygons

select an arbitrary polygon as the root of the tree

divide all remaining polygons into two subsets:

\* those in front of the selected polygon's plane

\* those behind the selected polygon's plane

 any polygons through which the plane passes are split into two polygons and the two parts put into the appropriate subsets

make two BSP trees, one from each of the two subsets

• these become the front and back subtrees of the root

 may be advisable to make, say, 20 trees with different random roots to be sure of getting a tree that is reasonably well balanced

You need to be able to tell which side of an arbitrary plane a vertex lies on and how to split a polygonputy ran aptibits any plane recession of the second strand by the second strand by the second strand by the second strand by the second second strand by the second second

### Drawing a BSP tree

- if the viewpoint is in front of the root's polygon's plane then:
  - draw the BSP tree for the *back* child of the root
  - draw the root's polygon
  - draw the BSP tree for the *front* child of the root
- otherwise:
  - draw the BSP tree for the *front* child of the root
  - draw the root's polygon
  - draw the BSP tree for the *back* child of the root

# Scan-line algorithms

- instead of drawing one polygon at a time: modify the 2D polygon scan-conversion algorithm to handle all of the polygons at once
- the algorithm keeps a list of the active edges in all polygons and proceeds one scan-line at a time
  - there is thus one large active edge list and one (even larger) edge list
    - enormous memory requirements
- still fill in pixels between adjacent pairs of edges on the scan-line but:
  - need to be intelligent about which polygon is in front and therefore what colours to put in the pixels
  - every edge is used in two pairs: one to the left and one to the right of it
### *z*-buffer polygon scan conversion

- depth sort & BSP-tree methods involve clever sorting algorithms followed by the invocation of the standard
  2D polygon scan conversion algorithm
- by modifying the 2D scan conversion algorithm we can remove the need to sort the polygons
  - makes hardware implementation easier
  - this is the algorithm used on graphics cards

#### *z*-buffer basics

+ store both *colour* and *depth* at each pixel

+ scan convert one polygon at a time in any order

+when scan converting a polygon:

- calculate the polygon's depth at each pixel
- if the polygon is closer than the current depth stored at that pixel
  - then store both the polygon's colour and depth at that pixel
  - otherwise do nothing

# *z*-buffer algorithm

#### *z*-buffer example

## **Interpolating depth values 1**

- just as we incrementally interpolate x as we move along each edge of the polygon, we can incrementally interpolate z:
  - as we move along the edge of the polygon
  - as we move across the polygon's projection

## **Interpolating depth values 2**

this point is halfway

between front and

not believe it)

this point is halfway

between front and

back in 2D (measure

with a ruler if you do

we thus have 2D vertices, with added depth information

 $[(x_a', y_a'), z_a]$ 

• we can interpolate x and y in 2D  $x' = (1-t)x_1' + (t)x_2'$   $y' = (1-t)y_1' + (t)y_2'$ 

but z must be interpolated in 3D

$$\frac{1}{z} = (1-t)\frac{1}{z_1} + (t)\frac{1}{z_2}$$

Computer Graphics & Image Processing 2014 (c) 1996-2014 Nell A Dodgson & Peter Robinson rungs on the ladder)

## **Interpolating depth values 3**

x = az + b

consider the projection onto the plane y=0

 $x' = x\frac{d}{z} = ad + \frac{bd}{z}$ 

now project to *z*=*d* 

## **Comparison of methods**

Algorithm	Complexity	Notes
Depth sort	O(N log N)	Need to resolve ambiguities
Scan line	O(N log N)	Memory intensive
BSP tree	O(N)	O(N log N) pre-processing step
<i>z</i> -buffer	O(N)	Easy to implement in hardware

- BSP is only useful for scenes which do not change
- as number of polygons increases, average size of polygon decreases, so time to draw a single polygon decreases
- z-buffer easy to implement in hardware: simply give it polygons in any order you like
- other algorithms need to know about all the polygons before drawing a single one, so that they can sort them into order

# Putting it all together - a summary

- \*a 3D polygon scan conversion algorithm needs to include:
  - a 2D polygon scan conversion algorithm
  - 2D or 3D polygon clipping
  - projection from 3D to 2D
  - either:
    - ordering the polygons so that they are drawn in the correct order
    - or:
      - **c**alculating the z value at each pixel and using a depth-buffer

# Anti-aliasing method 1: area averaging

average the contributions of all polygons to each pixel

- e.g. assume pixels are square and we just want the average colour in the square
- Ed Catmull developed an algorithm which does this:
  - works a scan-line at a time
  - clips all polygons to the scan-line
  - determines the fragment of each polygon which projects to each pixel
  - determines the amount of the pixel covered by the visible part of each fragment
  - pixel's colour is a weighted sum of the visible parts
- expensive algorithm!

266

## Anti-aliasing method 2: super-sampling

- sample on a finer grid, then average the samples in each pixel to produce the final colour
  - for an *n×n* sub-pixel grid, the algorithm would take roughly *n*<sup>2</sup> times as long as just taking one sample per pixel
- can simply average all of the sub-pixels in a pixel or can do some sort of weighted average

# The A-buffer – efficient super-sampling

- a significant modification of the z-buffer, which allows for subpixel sampling without as high an overhead as straightforward super-sampling
- basic observation:
  - a given polygon will cover a pixel:
    - totally
    - partially
    - not at all
- sub-pixel sampling is only required in the case of pixels which are partially covered by the polygon

#### **A-buffer: details**

- for each pixel, a list of masks is stored
- each mask shows how much of a polygon covers the pixel
- the masks are sorted in depth order
- a mask is a 4×8 array of bits:

need to store both colour and depth in addition to the mask

0 = polygon doesn't cover this sub-pixel

sampling is done at the centre of each of the sub-pixels

The use of 4×8 bits is because of the original architecture on which this was implemented. Computer Granningersal managemerse ingraphics and the set of th

## A-buffer: example

1

to get the final colour of the pixel you need to average together all visible bits of polygons

A=11111111 00011111 00000011 0000000 B=00000011 00000111 00001111 00011111 C=00000000 0000000 11111111 1111111

=0000000 0000000 00001100 0001111 -A A B-AA-BAC =0000000 0000000 11110000 1110000

A covers 15/32 of the pixel  $\neg A \land B$  covers 7/32 of the pixel  $\neg A \land \neg B \land C$  covers 7/32 of the pixel

## Making the A-buffer more efficient

- if a polygon *totally* covers a pixel then:
  - do not need to calculate a mask, because the mask is all Is
  - all masks currently in the list which are *behind* this polygon can be discarded
  - any subsequent polygons which are behind this polygon can be immediately discounted (without calculating a mask)
- in most scenes, therefore, the majority of pixels will have only a single entry in their list of masks
- the polygon scan-conversion algorithm can be structured so that it is immediately obvious whether a pixel is *totally* or *partially* within a polygon

## A-buffer: calculating masks

- clip polygon to pixel
- calculate the mask for each edge bounded by the right hand side of the pixel
  - there are few enough of these that they can be stored in a look-up table
- XOR all masks together

#### **A-buffer: comments**

- the A-buffer algorithm essentially adds anti-aliasing to the zbuffer algorithm in an efficient way
- most operations on masks are AND, OR, NOT, XOR
  - very efficient boolean operations
- why 4×8?
  - algorithm originally implemented on a machine with 32-bit registers (VAX 11/780)
  - on a 64-bit register machine, 8×8 is more sensible
- what does the A stand for in A-buffer?
  - anti-aliased, area averaged, accumulator

### **A-buffer: extensions**

- as presented the algorithm assumes that a mask has a constant depth (z value)
  - can modify the algorithm and perform approximate intersection between polygons
- can save memory by combining fragments which start life in the same primitive
  - e.g. two triangles that are part of the decomposition of a Bezier patch
- can extend to allow transparent objects

## **Computer Graphics & Image Processing**

- + Background
- + Simple rendering
- + Graphics pipeline
- Underlying algorithms
- + Colour and displays
  - Colour models for display and printing
  - Display technologies
  - Colour printing

#### +Image processing

## **Representing colour**

we need a mechanism which allows us to represent colour in the computer by some set of numbers

 preferably a small set of numbers which can be quantised to a fairly small number of bits each

#### we will discuss:

- Munsell's *artists'* scheme
  - which classifies colours on a perceptual basis
- the mechanism of colour vision
  - how colour perception works
- various colour spaces
  - which quantify colour based on either physical or perceptual models of colour

# Munsell's colour classification system

#### three axes

- hue > the dominant colour
- value > bright colours/dark colours
- chroma > vivid colours/dull colours
- can represent this as a 3D graph

# Munsell's colour classification system

- any two adjacent colours are a standard "perceptual" distance apart
  - worked out by testing it on people
  - a highly irregular space
    - e.g. vivid yellow is much brighter than vivid blue

## **XYZ colour space**

 not every wavelength can be represented as a mix of red, green, and blue lights

- but matching & defining coloured light with a mixture of three fixed primaries is desirable
- + CIE define three standard primaries: X, Y, Z

Relative radiation energy

Y matches the human eye's response to light of a constant intensity at each wavelength (*luminous-efficiency function of the eye*)

281

**EVDFH Sec 13.2.2** 

X, Y, and Z are not themselves colours, they are used for defining colours – you cannot make a light that emits one of these primaries

450 500 550 600 650 700 XYZ colour space was defined in 1931 by the Commission Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# **CIE chromaticity diagram**

+ chromaticity values are defined in terms of x, y, z

$$x = \frac{X}{X + Y + Z}, \quad y = \frac{Y}{X + Y + Z}, \quad z = \frac{Z}{X + Y + Z} \quad \therefore \quad x + y + z = 1$$

ignores luminance

- can be plotted as a 2D function
- pure colours (single wavelength) lie along the outer curve
- all other colours are a mix of pure colours and hence lie inside the curve
- points outside the curve do not exist as colours

## **Colour spaces**

- CIE XYZ, Yxy
- Uniform
  - equal steps in any direction make equal perceptual differences
  - **CIE**  $L^*u^*v^*$ , **CIE**  $L^*a^*b^*$
- Pragmatic
  - used because they relate directly to the way that the hardware works
  - RGB, CMY, CMYK
- Munsell-like
  - used in user-interfaces
  - considered to be easier to use for specifying colour than are the pragmatic colour spaces
  - map easily to the pragmatic colour spaces
  - HSV, HLS

# XYZ is not perceptually uniform

Fig. 17.5. MacAdam ellipses plotted in the CIE 1931 (x, y) chromaticity diagram. The axes of the ellipses are ten times their actual lengths (after MacAdam, 1943; Wright, 1943; MacAdam, 1993).

Each ellipse shows how far you can stray from the central point before a human being notices a difference in colour

Diodes (Cambridge Univ. Press)

#### Luv was designed to be more uniform

Fig. 17.7. MacAdam ellipses transformed to uniform CIE 1976 (u', v') chromaticity coordinates. For clarity, the axes of the transformed ellipses are ten times their actual lengths. Transformed ellipses are not ellipses in a strict mathematical sense, but their shapes closesly resemble those of ellipses. The areas of the transformed ellipses in the (u', v') diagram are much more similar than the MacAdam ellipses in the (x, y) diagram.

F F Schubert Light-Emitting Diodes (Cambridge Univ. Press) www.LightEmittingDiodes.org

 $L^*u^*v^*$  is an official CIE colour space. It is a straightforward distortion of XYZ space.

#### Lab space

- +another CIE colour space
- + based on complementary colour theory
  - see slide <u>206 (Colour</u>) signals sent to the brain)
- +also aims to be perceptually uniform
- $L^{*}=116(Y/Y_{n})^{1/3}$  $a = 500 [(X/X_n)^{1/3} - (Y/Y_n)^{1/3}]$  $b = 200 [(Y/Y_n)^{1/3} - (Z/Z_n)^{1/3}]$

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson-& Peter Robinson Blue

-a\*

## Lab space

- this visualization shows those colours in Lab space which a human can perceive
- +again we see that human perception of colour is not uniform
  - perception of colour diminishes at the white and black ends of the L axis
  - the maximum perceivable chroma differs for different hues

#### **RGB** space

 all display devices which output light mix red, green and blue lights to make colour

televisions, CRT monitors, video projectors, LCD screens
nominally, RGB space is a cube

+ the device puts physical limitations on:

- the range of colours which can be displayed
- the brightest colour which can be displayed
- the darkest colour which can be displayed

#### **RGB** in XYZ space

 CRTs and LCDs mix red, green, and blue to make all other colours

+ the red, green, and blue primaries each map to a point in XYZ space

- any colour within the resulting triangle can be displayed
  - any colour outside the triangle cannot be displayed
  - for example: CRTs cannot display very saturated purple, turquoise, or yellow

#### CMY space

- + printers make colour by mixing coloured inks
- the important difference between inks (CMY) and lights (RGB) is that, while lights emit light, inks absorb light
  - cyan absorbs red, reflects blue and green
  - magenta absorbs green, reflects red and blue
  - yellow absorbs blue, reflects green and red
- + CMY is, at its simplest, the inverse of RGB
- + CMY space is nominally a cube

# Ideal and actual printing ink reflectivities

M

## **CMYK** space

- in real printing we use black(key) as well as CMY
- +why use black?
  - inks are not perfect absorbers
  - mixing C + M + Y gives a muddy grey, not black
  - lots of text is printed in black: trying to align C, M and Y perfectly for black text would be a nightmare

C + M + Y + K

C + M + Y

C + M

# Using K

 if we print using just CMY then we can get up to 300% ink at any point on the paper
removing the achromatic portion of CMY and replacing

CMY and replacing with K reduces the maximum possible ink coverage to 200%

1996-2014 Neil A Dodgson & Peter Robinson
#### **Colour spaces for user-interfaces**

- *RGB* and *CMY* are based on the physical devices which produce the coloured output
- *RGB* and *CMY* are difficult for humans to use for selecting colours

+ Munsell's colour system is much more intuitive:

- hue what is the principal colour?
- value how light or dark is it?
- chroma how vivid or dull is it?
- computer interface designers have developed basic transformations of *RGB* which resemble Munsell's human-friendly system

#### HSV: hue saturation value

- +three axes, as with Munsell
  - hue and value have same meaning
  - the term "saturation" replaces the term "chroma"

- designed by Alvy Ray Smith in 1978
- algorithm to convert HSV to RGB and back can be found in Foley et al.,

Computer Graphics & Image Processing 2014 (c) 199 - 2014 Ngil 3 Dog grad Robinson

# HLS: hue lightness saturation

- + a simple variation of HSV
  - hue and saturation have same meaning
  - the term "lightness" replaces the term "value"
- designed to address the complaint that HSV has all pure colours having the same lightness/value as white
  - designed by Metrick in 1979
  - algorithm to convert HLS to RGB and back can be found in Foley et

Computer Francics 3. 1969 Red ces 3ing 7014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

#### Summary of colour spaces

- the eye has three types of colour receptor
- therefore we can validly use a three-dimensional co-ordinate system to represent colour
- XYZ is one such co-ordinate system
  - Y is the eye's response to intensity (luminance)
  - $\blacksquare$  X and Z are, therefore, the colour co-ordinates
    - same Y, change X or  $Z \Rightarrow$  same intensity, different colour
    - same X and Z, change  $Y \Rightarrow$  same colour, different intensity
- there are other co-ordinate systems with a luminance axis
  - *L*\**a*\**b*\*, *L*\**u*\**v*\*, *HSV*, *HLS*
- some other systems use three colour co-ordinates
  - RGB, CMY
  - Iuminance can then be derived as some function of the three

e.g. in RGB: Y = 0.299 R + 0.587 G + 0.114 BComputer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# Image display

#### a handful of technologies cover over 99% of all display devices

- active displays
  - cathode ray tube
  - liquid crystal display
  - plasma displays
  - digital mirror displays
- printers (passive displays)
  - laser printers
  - ink jet printers
  - commercial printers

most common today briefly popular but power-hungry increasing use in video projectors

standard for late 20<sup>th</sup> century

the traditional office printer the traditional home printer for high volume

# Liquid crystal displays I

- liquid crystals can twist the polarisation of light
- basic control is by the voltage that is applied across the liquid crystal: either on or off, transparent or opaque
- greyscale can be achieved with some types of liquid crystal by varying the voltage
- colour is achieved with colour filters

# Liquid crystal displays II

there are two polarizers at right angles to one another on either side of the liquid crystal: under normal circumstances these would block all light

there are liquid crystal directors: micro-grooves which align the liquid crystal molecules next to them

the liquid crystal molecules try to line up with one another; the micro-grooves on each side are at right angles to one another which forces the crystals' orientations to twist gently through 90° as you go from top to bottom, causing the polarization of the light to twist through 90°, making the pixel transparent

liquid crystal molecules are polar: they have a positive and a negative end

applying a voltage across the liquid crystal causes the molecules to stand on their ends, ruining the twisting phenomenon, so light cannot get through and the pixel is Copaquer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# Liquid crystal displays III

- low power consumption compared to CRTs although the back light uses a lot of power
- image quality historically not as good as cathode ray tubes, but improved dramatically over the last ten years

🔶 uses

- laptops
- video projectors
- rapidly replacing CRTs as desk top displays
- increasing use as televisions

a three LCD video projector, with colour made by devoting one LCD panel to each of red, green and blue, and by splitting the light using dichroic mirrors Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Which pass some wavelengths and reflect others

# **Digital micromirror devices I**

- developed by Texas Instruments
  - often referred to as Digital Light Processing (DLP) technology
- invented in 1987, following ten year's work on deformable mirror devices
- manufactured like a silicon chip!
  - a standard 5 volt, 0.8 micron, CMOS process
  - micromirrors are coated with a highly reflected aluminium alloy
  - each mirror is 16×16µm<sup>2</sup>

## **Digital micromirror devices II**

- used increasingly in video projectors
- widely available from late 1990s
- colour is achieved using either three DMD chips or one chip and a rotating colour filter

## **Electrophoretic displays I**

electronic paper widely used in e-books
iRex iLiad, Sony Reader, Amazon Kindle
200 dpi passive display

305

Computer Graphics & Image Processing 2014

# **Electrophoretic displays II**

transparent capsules ~40µ diameter

- filled with dark oil
- negatively charged 1µ titanium dioxide particles

+ electrodes in substrate attract or repel white particles

+ image persists with no power consumption

## **Electrophoretic displays III**

colour filters over individual pixels

flexible substrate
 using plastic
 semiconductors
 (Plastic Logic)

# **Printers**

#### + many types of printer

- ink jet
  - sprays ink onto paper
- laser printer
  - uses a laser to lay down a pattern of charge on a drum; this picks up charged toner which is then pressed onto the paper

#### commercial offset printer

- an image of the whole page is put on a roller
- this is repeatedly inked and pressed against the paper to print thousands of copies of the same thing
- +all make marks on paper
  - essentially binary devices: mark/no mark

#### **Printer resolution**

- +laser printer
  - ♦ 300—1200dpi
- +ink jet
  - used to be lower resolution & quality than laser printers but now have comparable resolution
- + phototypesetter for commercial offset printing
  - I 200–2400 dpi
- + bi-level devices: each pixel is either on or off
  - black or white (for monochrome printers)
  - ink or no ink (in general)

# What about greyscale?

#### achieved by halftoning

- divide image into cells, in each cell draw a spot of the appropriate size for the intensity of that cell
- on a printer each cell is  $m \times m$  pixels, allowing  $m^2+1$  different intensity levels
- e.g. 300dpi with 4×4 cells ⇒ 75 cells per inch, 17 intensity levels
- phototypesetters can make 256 intensity levels in cells so small you can only just see them
- an alternative method is dithering
  - dithering photocopies badly, halftoning photocopies well

Computerills dissources shall the ninge and gittle ing 1 ing

#### Halftoning & dithering examples

рп

311

#### Dithering

#### What about colour?

 generally use cyan, magenta, yellow, and black inks (CMYK)

+ inks aborb colour

c.f. lights which *emit* colour

- CMY is the inverse of RGB
- + why is black (K) necessary?
  - inks are not perfect aborbers
  - mixing C + M + Y gives a muddy grey, not black
  - lots of text is printed in black: trying to align C, M and Y perfectly for black text would be a nightmare

#### How do you produce halftoned colour?

- print four halftone screens, one in each colour
- carefully angle the screens to prevent interference (moiré) patterns

150 lpi × 16 dots per cell = 2400 dpi phototypesetter (16×16 dots per cell = 256 intensity levels)

Standaro	<i>I rulings</i> (in lines per inch)
65 lpi	
85 lpi	newsprint
100 lpi	
120 lpi	uncoated offset paper
133 lpi	uncoated offset paper
150 lpi	matt coated offset paper or art paper
	publication: books, advertising leaflets
200 lpi	very smooth, expensive paper
	very high quality publication

#### Four colour halftone screens

Standard angles

- Cyan 15°
- Black 45°
- Magenta 75°
- Yellow 90°

Magenta, Cyan & Black are at 30° relative to one another Yellow (least distinctive

colour) is at 15° relative to Magenta and Cyan

- At bottom is the moiré pattern
  - this is the best possible (minimal) moiré pattern
  - produced by this optimal set of angles
  - all four colours printed in black to highlight the effect

& marce Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

# Range of printable colours

a: colour photography (diapositive)b: high-quality offset printingc: newspaper printing

#### why the hexagonal shape?

because we can print dots which only partially overlap making the situation more complex than for

coloured lights

# **Beyond four colour printing**

printers can be built to do printing in more colours

- gives a better range of printable colours
- six colour printing
  - for home photograph printing
  - dark & light cyan, dark & light magenta, yellow, black
- eight colour printing
  - 3× cyan, 3× magenta, yellow, black
  - 2× cyan, 2× magenta, yellow, 3× black
- twelve colour printing
  - 3× cyan, 3× magenta, yellow, black red, green, blue, orange

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodge

#### The extra range of colour

- this gamut is for so-called HiFi colour printing
  - uses cyan,
     magenta, yellow,
     plus red, green and
     blue inks

Computer Graphics & Image Processing 2014 (c) 1996-20

#### Laser printer

# Ink jet printers

# **Commercial offset printing**

- the plate cylinder is where the printing plate is held
- this is dampened and inked anew on every pass
- the impression from the plate cylinder is passed onto the blanket cylinder
- it is then transferred it onto the paper which passes between the blanket and impression cylinders
- the blanket cylinder is there so that the printing plate does not come into direct contact with

Computer Graphics & Image Processing 2014 (c) 1996-20the Beipaperson & Peter Robinson

## **Computer Graphics & Image Processing**

- + Background
- + Simple rendering
- + Graphics pipeline
- Underlying algorithms
- + Colour and displays
- +Image processing
  - Point processing
  - Area processing
  - Rendering

# Point processing

+ each pixel's value is modified

the modification function only takes that pixel's value into account

$$p'(i,j) = f\{p(i,j)\}$$

- where p(i,j) is the value of the pixel and p'(i,j) is the modified value
- the modification function, f(p), can perform any operation that maps one intensity value to another

# Point processing inverting an image

# Point processing improving an image's contrast

dark histogram

improved histogram

# Point processing modifying the output of a filter

black = edge black or white = edge black = edge white = no edge mid-grey = no edge white = no edge grey = indeterminate f(p)f(p)white white<sup>-</sup> thresholding  $\rightarrow p$ black <sup>+</sup> black +  $\rightarrow p$ black white black white

#### Image compositing

#### + merging two or more images together

what does this operator do?

# Simple compositing

+ copy pixels from one image to another

- only copying the pixels you want
- use a mask to specify the desired pixels

## Alpha blending for compositing

+ instead of a simple boolean mask, use an alpha mask

 value of alpha mask determines how much of each image to blend together to produce final pixel

# **Differencing – an example**

the two images are taken from slightly different viewpoints

take the difference between the two images

$$d = 1 - |a - b|$$

where 1 = white and 0 = black

black = large difference
white = no difference

#### **Differencing – an example**

take the difference between the two images

d = |a - b|where 1 = white and 0 = black black = no difference
white = large difference

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

Computer Graphics & Imagé Processing 2014 (C) 1990-2014 Neil A Dougson & Peter Robinson

# Filtering

+ move a filter over the image, calculating a new value for every pixel

#### Filters - discrete convolution

 convolve a discrete filter with the image to produce a new image

in one dimension:

$$f'(x) = \sum_{i=-\infty}^{+\infty} h(i) \times f(x-i)$$
  
where  $h(i)$  is the filter

in two dimensions:

$$f'(x, y) = \sum_{i=-\infty}^{+\infty} \sum_{j=-\infty}^{+\infty} h(i, j) \times f(x-i, y-j)$$

### Example filter - horizontal edge detection

original image

# after use of a 3×3 Prewitt horizontal edge detection filter

*mid-grey* = *no edge*, *black or white* = *strong edge* 

# Median filtering

not a convolution method

the new value of a pixel is the median of the values of all the pixels in its neighbourhood

e.g. 3×3 median filter

sort into order and take median

#### Median filter - example

Original noisy image Small median filter Large median filter Computer Graphics & Image Processing 2014 (s) the file of the fil

#### **Median filter - limitations**

+ copes well with shot (impulse) noise + not so good at other types of noise

original

in this example, median filter reduces noise but doesn't eliminate it

Gaussian filter eliminates noise at the expense of excessive blurring

Peter Robinson

#### Median filter – as an artistic effect

# Filtering based on local image properties

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Photosnop Crystallize filter with cell size 20

# Filtering based on local image properties

### Filtering based on global image properties

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson Photoshop Auto Colour adjustment

# Morphological image processing

+ Consider images as sets of binary pixels

• Image  $I \subseteq \mathbb{Z}^n$  (with n = 2 for images)

• Structuring element  $S \subseteq \mathbb{Z}^n$ 

# Dilation

*+ I* ⊕ *S* = {*i* + *s* | *i* ∈ *I*, *s* ∈ *S*} *+* expands image by structuring element

#### **Erosion**

 $+I \ominus S = \{x | \forall s \in S. x + s \in I\}$ 

+ set of points where S can be centred to lie entirely inside I

# Opening

#### $+ I \circ S = (I \ominus S) \oplus S$

#### + Smooths outlines and breaks narrow links

# Closing

#### $+I \odot S = (I \oplus S) \ominus S$

+ Smooths outlines and joins narrow breaks

### Boundary

#### + $\beta(I) = I - (I \ominus B)$ +where B is a solid 3 × 3 template

#### Morphology with grey scales

+ Consider images as functions  $f: \mathbb{Z}^2 \to \mathbb{R}$ 

◆ still with structuring element  $S \subseteq \mathbb{Z}^2$ 

+ Dilation: 
$$(f \oplus S)(p) = \max_{s \in S} f(p + s)$$

largest value in S-shaped region

+ Erosion: 
$$(f \ominus S)(p) = \min_{s \in S} f(p + s)$$

smallest value in S-shaped region

+ Same opening and closing

# Halftoning & dithering

+ mainly used to convert greyscale to binary

- e.g. printing greyscale pictures on a laser printer
- 8-bit to 1-bit
- is also used in colour printing, normally with four colours:
  - cyan, magenta, yellow, black

# Halftoning

+each greyscale pixel maps to a square of binary pixels

- e.g. five intensity levels can be approximated by a 2×2 pixel square
  - I-to-4 pixel mapping

#### Halftoning dither matrix

+ one possible set of patterns for the 3×3 case is:

+ these patterns can be represented by the *dither* 

*matrix*:

7	9	5
2	1	4
6	3	8

1-to-9 pixel mapping

### Rules for halftone pattern design

mustn't introduce visual artefacts in areas of constant intensity

e.g. this won't work very well:

- every *on* pixel in intensity level *j* must also be *on* in levels > *j* 
  - i.e. *on* pixels form a *growth sequence*
- pattern must grow outward from the centre
  - simulates a dot getting bigger
- all On pixels must be connected to one another
  - this is essential for printing, as isolated *ON* pixels will not print very well (if at all)

#### **Ordered dither**

- halftone prints and photocopies well, at the expense of large dots
- an ordered dither matrix produces a nicer visual result than a halftone dither matrix

Exercise: phototypesetters may use halftone cells up to size I 6x I 6, with 256 entries; either construct a halftone dither matrix for a cell that large or, better, an algorithm to generate an appropriate maliftone dither matrix<sup>2014</sup> (c) 1996-2014 Neil A Dodgson & Peter Robinson

# 1-to-1 pixel mapping

#### a simple modification of the ordered dither method can be used

 turn a pixel *on* if its intensity is greater than (or equal to) the value of the corresponding cell in the dither matrix

~ ~		_		n	1	
e.g.	quantica 8 hit nival valua	$d_{m,n}$	0	1	2	3
	a = n  div  15	0	1	9	3	11
	$\mathbf{q}_{i,j} = p_{i,j} \mathbf{u} \mathbf{v} \mathbf{r} \mathbf{s}$	1	15	5	13	7
	find binary value	<sup>n</sup> 2	4	12	2	10
	$b_{i,i} = (q_{i,i} \ge d_{i \mod 4, i \mod 4})$	3	14	8	16	6
	$i,j \rightarrow i,j \rightarrow i \mod 4,j \mod 4$					

### **Error diffusion**

 error diffusion gives a more pleasing visual result than ordered dither

+ method:

- work left to right, top to bottom
- map each pixel to the closest quantised value
- pass the quantisation error on to the pixels to the right and below, and add in the errors before quantising these pixels

#### Error diffusion - example (1)

#### + map 8-bit pixels to 1-bit pixels

quantise and calculate new error values

8-bit value	1-bit value	error
$f_{i,j}$	$b_{i,j}$	$e_{i,j}$
0-127	0	$f_{i,j}$
128-255	1	$f_{i,j} - 255$

each 8-bit value is calculated from pixel and error values:

$$f_{i,j} = p_{i,j} + \frac{1}{2}e_{i-1,j} + \frac{1}{2}e_{i,j-1}$$

in this example the errors from the pixels to the left and above are taken into account

### Error diffusion - example (2)

![](_page_355_Figure_1.jpeg)

Computer Graphics & Image Processing 2014 (c) 1996-2014 Neil A Dodgson & Peter Robinson

-59

#### **Error diffusion**

- Floyd & Steinberg developed the error diffusion method in 1975
  - often called the "Floyd-Steinberg algorithm"
- their original method diffused the errors in the following proportions:

![](_page_356_Figure_4.jpeg)

# Halftoning & dithering — examples

original

ordered dither

error diffused

![](_page_357_Figure_4.jpeg)

# Halftoning & dithering — examples

#### original

halftoned with a very fine screen

#### ordered dither

the regular dither pattern is clearly visible

#### error diffused

more random than ordered dither and therefore looks more attractive to the human eye

#### thresholding

 $<128 \Rightarrow black$ 

 $\geq$ 128  $\Rightarrow$  white

#### halftoning

the larger the cell size, the more intensity levels available

the smaller the cell, the less noticable the halftone dots

#### **Course review**
