

## Denotational semantics of PCF

---

**Proposition.** *For all typing judgements  $\Gamma \vdash M : \tau$ , the denotation*

$$\llbracket \Gamma \vdash M \rrbracket : \llbracket \Gamma \rrbracket \rightarrow \llbracket \tau \rrbracket$$

*is a well-defined continuous function.*

## Denotations of closed terms

---

For a closed term  $M \in \text{PCF}_\tau$ , we get

$$\llbracket \emptyset \vdash M \rrbracket : \llbracket \emptyset \rrbracket \rightarrow \llbracket \tau \rrbracket$$

and, since  $\llbracket \emptyset \rrbracket = \{ \perp \}$ , we have

$$\llbracket M \rrbracket \stackrel{\text{def}}{=} \llbracket \emptyset \vdash M \rrbracket (\perp) \in \llbracket \tau \rrbracket \quad (M \in \text{PCF}_\tau)$$

Proof By induction.

## Compositionality

---

**Proposition.** For all typing judgements  $\Gamma \vdash M : \tau$  and  $\Gamma \vdash M' : \tau$ , and all contexts  $\mathcal{C}[-]$  such that  $\Gamma' \vdash \mathcal{C}[M] : \tau'$  and  $\Gamma' \vdash \mathcal{C}[M'] : \tau'$ ,

if  $[[\Gamma \vdash M]] = [[\Gamma \vdash M']] : [[\Gamma]] \rightarrow [[\tau]]$

then  $[[\Gamma' \vdash \mathcal{C}[M]]] = [[\Gamma' \vdash \mathcal{C}[M']]] : [[\Gamma']] \rightarrow [[\tau']]$   $\mathcal{C}[-] = \text{fix}[-]$

Example

$$[[\Gamma \vdash M]] = [[\Gamma \vdash M']] : [[\Gamma]] \rightarrow [[\tau]] \rightarrow ([[z]] \rightarrow [[z]])$$

$$\Rightarrow [[\Gamma \vdash \underline{\text{fix}}(M)]] = [[\Gamma \vdash \underline{\text{fix}}(M')]] : [[\Gamma]] \rightarrow [[\tau]]$$

$$\begin{aligned} \llbracket R \vdash \text{fix}(M) \rrbracket &= \underline{\text{fix}} \circ \llbracket R \vdash M \rrbracket \\ &= \underline{\text{fix}} \circ \llbracket R \vdash M' \rrbracket \\ &= \llbracket R \vdash \underline{\text{fix}}(M') \rrbracket \end{aligned}$$

## Soundness

---

**Proposition.** For all closed terms  $M, V \in \text{PCF}_\tau$ ,

if  $M \Downarrow_\tau V$  then  $\llbracket M \rrbracket = \llbracket V \rrbracket \in \llbracket \tau \rrbracket$ .

Proof By induction on the derivation of  $M \Downarrow_\tau V$ .

Example

$$M_1 \Downarrow \text{fix}. M' \quad M' [M_2/x] \Downarrow V$$

---

$$M = M_1 M_2 \Downarrow V$$

By induction

- $\llbracket M_1 \rrbracket = \llbracket \lambda x. M' \rrbracket = \lambda d. \llbracket M' \rrbracket [x \mapsto d]$

- $\llbracket M' [M_2/x] \rrbracket = \llbracket V \rrbracket$

NEED TO BE  
RELATED!

Then

$$\llbracket M_1 M_2 \rrbracket = \llbracket M_1 \rrbracket (\llbracket M_2 \rrbracket) = \llbracket M' \rrbracket [x \mapsto \llbracket M_2 \rrbracket]$$

## Substitution property

---

**Proposition.** Suppose that  $\Gamma \vdash M : \tau$  and that  $\Gamma[x \mapsto \tau] \vdash M' : \tau'$ , so that we also have  $\Gamma \vdash M'[M/x] : \tau'$ .

Then,

$$\begin{aligned} & \llbracket \Gamma \vdash M'[M/x] \rrbracket (\rho) \\ &= \llbracket \Gamma[x \mapsto \tau] \vdash M' \rrbracket (\rho[x \mapsto \llbracket \Gamma \vdash M \rrbracket]) \end{aligned}$$

for all  $\rho \in \llbracket \Gamma \rrbracket$ .

By abuse the substitution function is interpreted as function application

## Substitution property

---

**Proposition.** *Suppose that  $\Gamma \vdash M : \tau$  and that  $\Gamma[x \mapsto \tau] \vdash M' : \tau'$ , so that we also have  $\Gamma \vdash M'[M/x] : \tau'$ .*

*Then,*

$$\begin{aligned} & \llbracket \Gamma \vdash M'[M/x] \rrbracket (\rho) \\ &= \llbracket \Gamma[x \mapsto \tau] \vdash M' \rrbracket (\rho[x \mapsto \llbracket \Gamma \vdash M \rrbracket]) \end{aligned}$$

*for all  $\rho \in \llbracket \Gamma \rrbracket$ .*

---

In particular when  $\Gamma = \emptyset$ ,  $\llbracket \langle x \mapsto \tau \rangle \vdash M' \rrbracket : \llbracket \tau \rrbracket \rightarrow \llbracket \tau' \rrbracket$  and

$$\llbracket M'[M/x] \rrbracket = \llbracket \langle x \mapsto \tau \rangle \vdash M' \rrbracket (\llbracket M \rrbracket)$$

# *Topic 7*

Relating Denotational and Operational Semantics

# Adequacy

---

For any closed PCF terms  $M$  and  $V$  of *ground* type  
 $\gamma \in \{\text{nat}, \text{bool}\}$  with  $V$  a value

$$\llbracket M \rrbracket = \llbracket V \rrbracket \in \llbracket \gamma \rrbracket \implies M \Downarrow_{\gamma} V.$$

ground type  
"observable  
behaviour"

## Adequacy

---

For any closed PCF terms  $M$  and  $V$  of *ground* type  $\gamma \in \{nat, bool\}$  with  $V$  a value

$$\llbracket M \rrbracket = \llbracket V \rrbracket \in \llbracket \gamma \rrbracket \implies M \Downarrow_{\gamma} V.$$

---

**NB.** Adequacy does not hold at function types:

$$\llbracket \mathbf{fn} \ x : \tau. (\mathbf{fn} \ y : \tau. y) \ x \rrbracket = \llbracket \mathbf{fn} \ x : \tau. x \rrbracket : \llbracket \tau \rrbracket \rightarrow \llbracket \tau \rrbracket$$

but

$$\mathbf{fn} \ x : \tau. (\mathbf{fn} \ y : \tau. y) \ x \not\Downarrow_{\tau \rightarrow \tau} \mathbf{fn} \ x : \tau. x$$

## Adequacy proof idea

---

1. We cannot proceed to prove the adequacy statement by a straightforward induction on the structure of terms.

► Consider  $M$  to be  $M_1 M_2$ ,  $\mathbf{fix}(M')$ .

$$\llbracket M \rrbracket = \llbracket V \rrbracket \in \llbracket \sigma \rrbracket \Rightarrow M \Downarrow_{\sigma} V \quad \sigma \text{ ground.}$$

say  $M = M_1 M_2$  is of function type

$$\llbracket M_1 M_2 \rrbracket = \llbracket M_1 \rrbracket (\llbracket M_2 \rrbracket)$$

Idea: We will prove something general for all types that implies adequacy (at ground types).

## Adequacy proof idea

at ground type  
we define  $\triangleleft_{\sigma}$

1. We cannot proceed to prove the adequacy statement by a straightforward induction on the structure of terms.

so that adequacy is implied.

► Consider  $M$  to be  $M_1 M_2$ ,  $\mathbf{fix}(M')$ .

2. So we proceed to prove a stronger statement that applies to terms of arbitrary types and implies adequacy.

This statement roughly takes the form:

$$\llbracket M \rrbracket \triangleleft_{\tau} M \text{ for all types } \tau \text{ and all } M \in \text{PCF}_{\tau}$$

the statement

where the *formal approximation relations*

$\llbracket M \rrbracket \triangleleft_{\sigma} M$  will imply adequacy

at higher type  $\triangleleft \sigma \rightarrow \tau$  ?

$$\triangleleft_{\tau} \subseteq \llbracket \tau \rrbracket \times \text{PCF}_{\tau}$$

are *logically* chosen to allow a proof by induction.

→ LOGICAL RELATIONS.

## Requirements on the formal approximation relations, I

---

We want that, for  $\gamma \in \{nat, bool\}$ ,

$$\llbracket M \rrbracket \triangleleft_{\gamma} M \text{ implies } \underbrace{\forall V (\llbracket M \rrbracket = \llbracket V \rrbracket \implies M \downarrow_{\gamma} V)}_{\text{adequacy}}$$

$\gamma = \underline{nat}$

$n \triangleleft_{\underline{nat}} M ?$

remark  
 $\llbracket \underline{\text{succ}}^n(0) \rrbracket = n \in \mathbb{N}$

**Definition of**  $d \triangleleft_\gamma M$  ( $d \in \llbracket \gamma \rrbracket, M \in \text{PCF}_\gamma$ )  
**for**  $\gamma \in \{\text{nat}, \text{bool}\}$

---

$$n \triangleleft_{\text{nat}} M \stackrel{\text{def}}{\iff} (n \in \mathbb{N} \Rightarrow M \Downarrow_{\text{nat}} \mathbf{succ}^n(\mathbf{0}))$$

$$b \triangleleft_{\text{bool}} M \stackrel{\text{def}}{\iff} (b = \text{true} \Rightarrow M \Downarrow_{\text{bool}} \mathbf{true})$$

$$\quad \& (b = \text{false} \Rightarrow M \Downarrow_{\text{bool}} \mathbf{false})$$

Suppose  $\llbracket M \rrbracket \triangleleft_{\text{nat}} M \stackrel{?}{\implies} (\llbracket M \rrbracket = \llbracket V \rrbracket \Rightarrow M \Downarrow V)$

Assume  $\llbracket M \rrbracket = \llbracket V \rrbracket$ , say  $V = \underline{\text{succ}}^n(0)$ . Then  $\llbracket M \rrbracket = n$

and  $n \triangleleft_{\text{nat}} M \implies M \Downarrow_{\text{nat}} \text{succ}^n(0) = V$

## Proof of: $\llbracket M \rrbracket \triangleleft_\gamma M$ implies **adequacy**

---

**Case**  $\gamma = \mathit{nat}$ .

$$\llbracket M \rrbracket = \llbracket V \rrbracket$$

$$\implies \llbracket M \rrbracket = \llbracket \mathbf{succ}^n(\mathbf{0}) \rrbracket \quad \text{for some } n \in \mathbb{N}$$

$$\implies n = \llbracket M \rrbracket \triangleleft_\gamma M$$

$$\implies M \Downarrow \mathbf{succ}^n(\mathbf{0}) \quad \text{by definition of } \triangleleft_{\mathit{nat}}$$

**Case**  $\gamma = \mathit{bool}$  is similar.

Want to prove  $\llbracket M \rrbracket \triangleq_z M$  for all  $z$  by induction

$$f \triangleq M \stackrel{\text{def}}{\iff} \forall d \triangleq_0 N. f(d) \triangleq_z M N$$

$\sigma \rightarrow z$

### Requirements on the formal approximation relations, II

We want to be able to proceed by induction.

► Consider the case  $M = M_1 M_2$ .

by induction

↪ logical definition

$$\llbracket M_1 \rrbracket \triangleq_{\sigma \rightarrow z} M_1 \quad \llbracket M_2 \rrbracket \triangleq_0 M_2$$

$$\llbracket M_1 \rrbracket (\llbracket M_2 \rrbracket)$$

$$= \llbracket M_1 M_2 \rrbracket \triangleq_z M_1 M_2 \quad : \text{RTP}$$
