

# Mobile and Sensor Systems

Lecture 3: Wireless Sensor Systems

Prof Cecilia Mascolo

# In this lecture

- We will describe wireless sensor networks in general and the properties of sensor nodes.
- We will introduce sensor network MAC Layer issues and some solutions.

# Wireless Sensor Networks?

- In many situations, we want to measure things to develop a better understanding of various phenomena.
- With this insight, we can then design novel or improved systems.

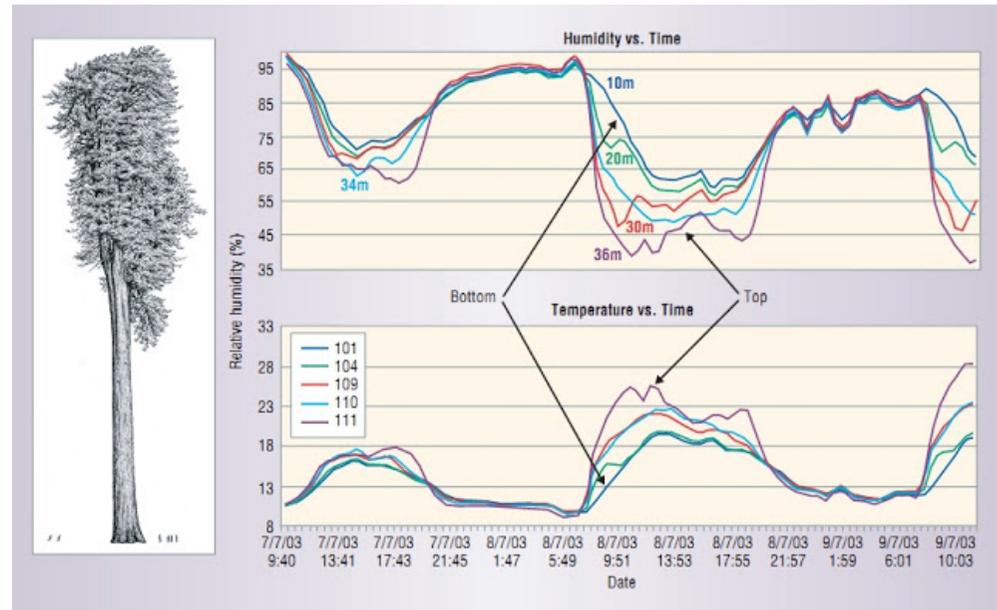

# Example: Sensor Network Macroscopic

Conventional Manual Monitoring

Long-lived High-density Sensing Networks

# Many Applications

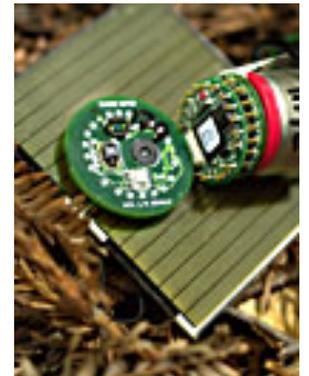

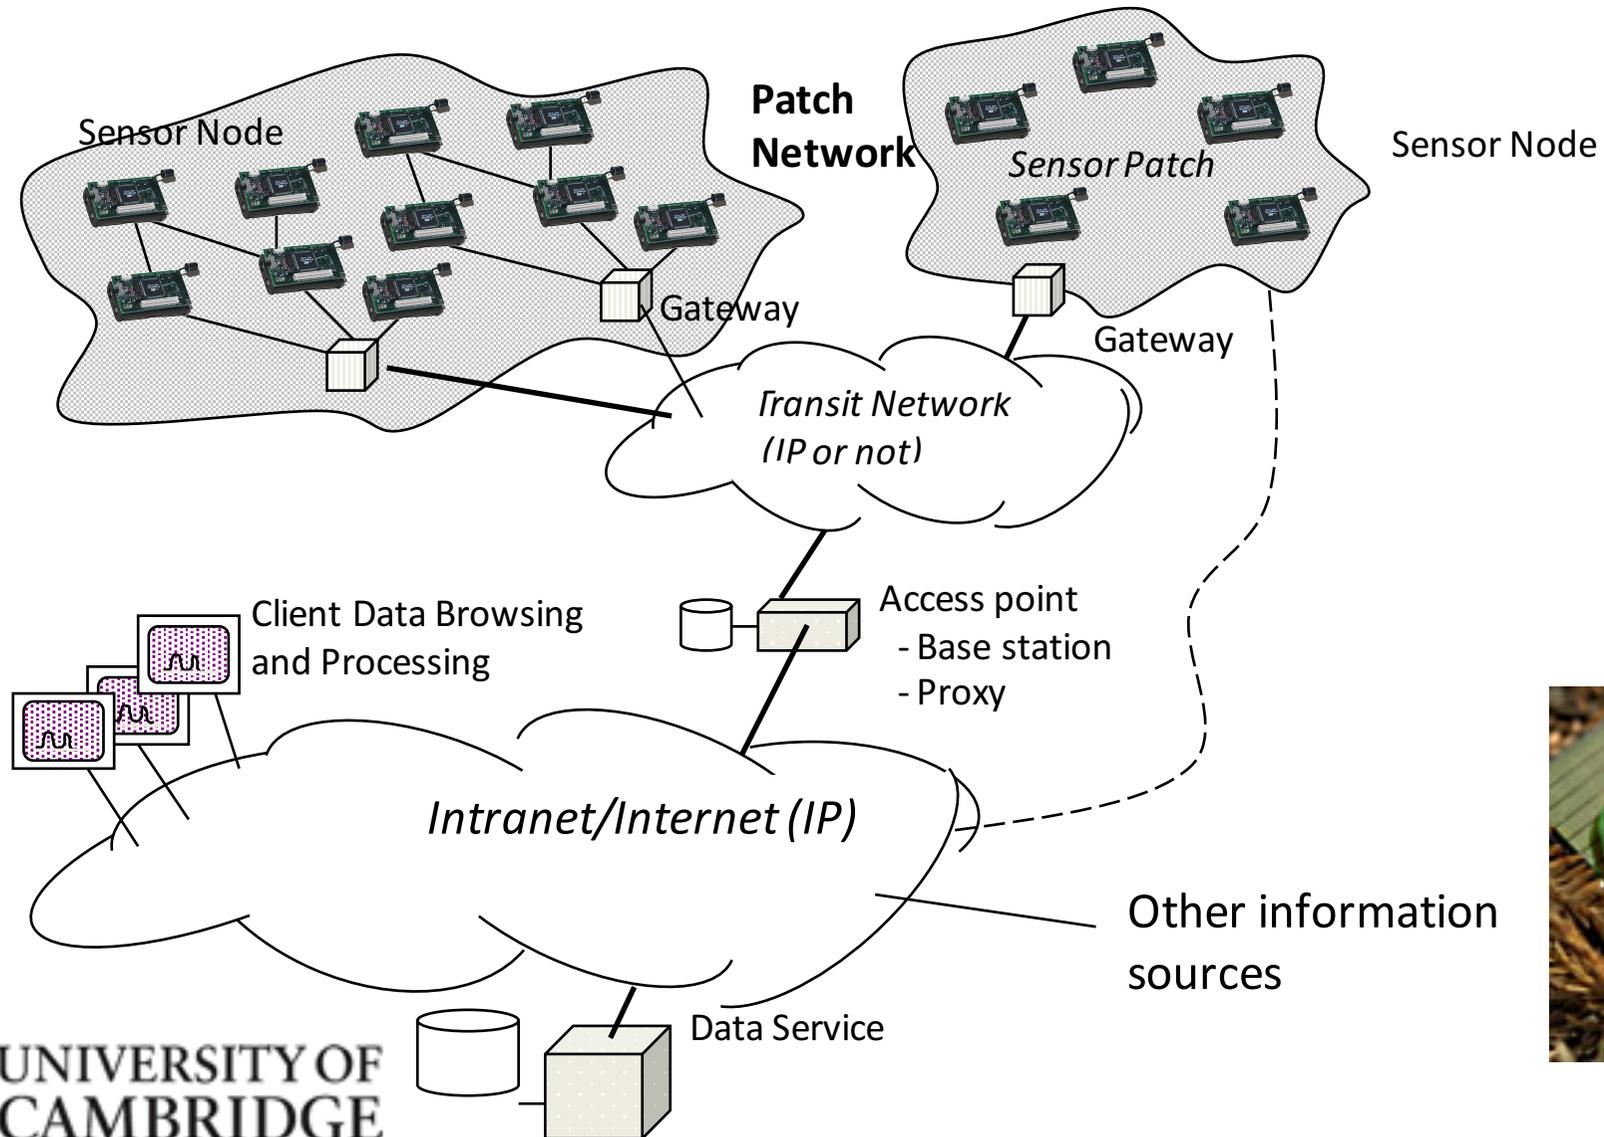

- Structural health monitoring
- Environmental monitoring
- Animal behaviour
- Warehouse logistics

# Characteristics

- Farmer wants to cover his entire vineyard
  - Large number of sensing devices.
- He wants to keep the cost down
  - Low cost, resource constrained.
- He cannot run wires to these many devices
  - Battery powered, wireless.

# An Example of Sensor Network Architecture

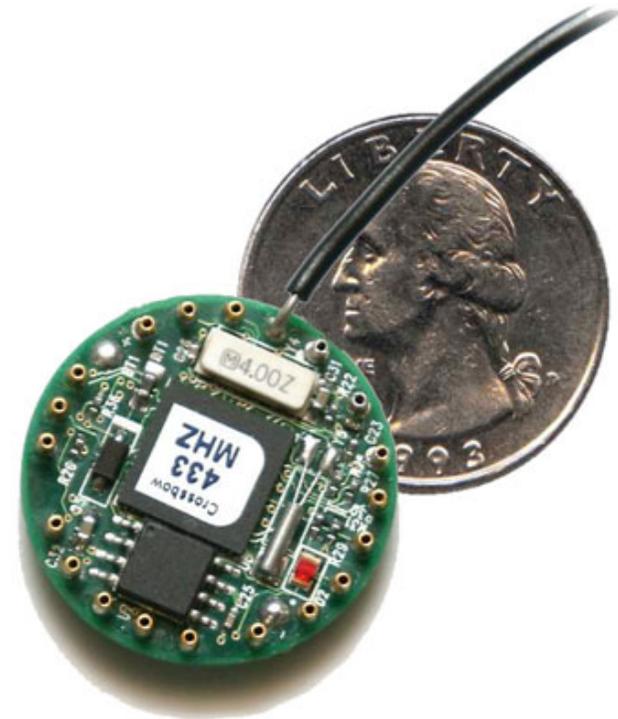

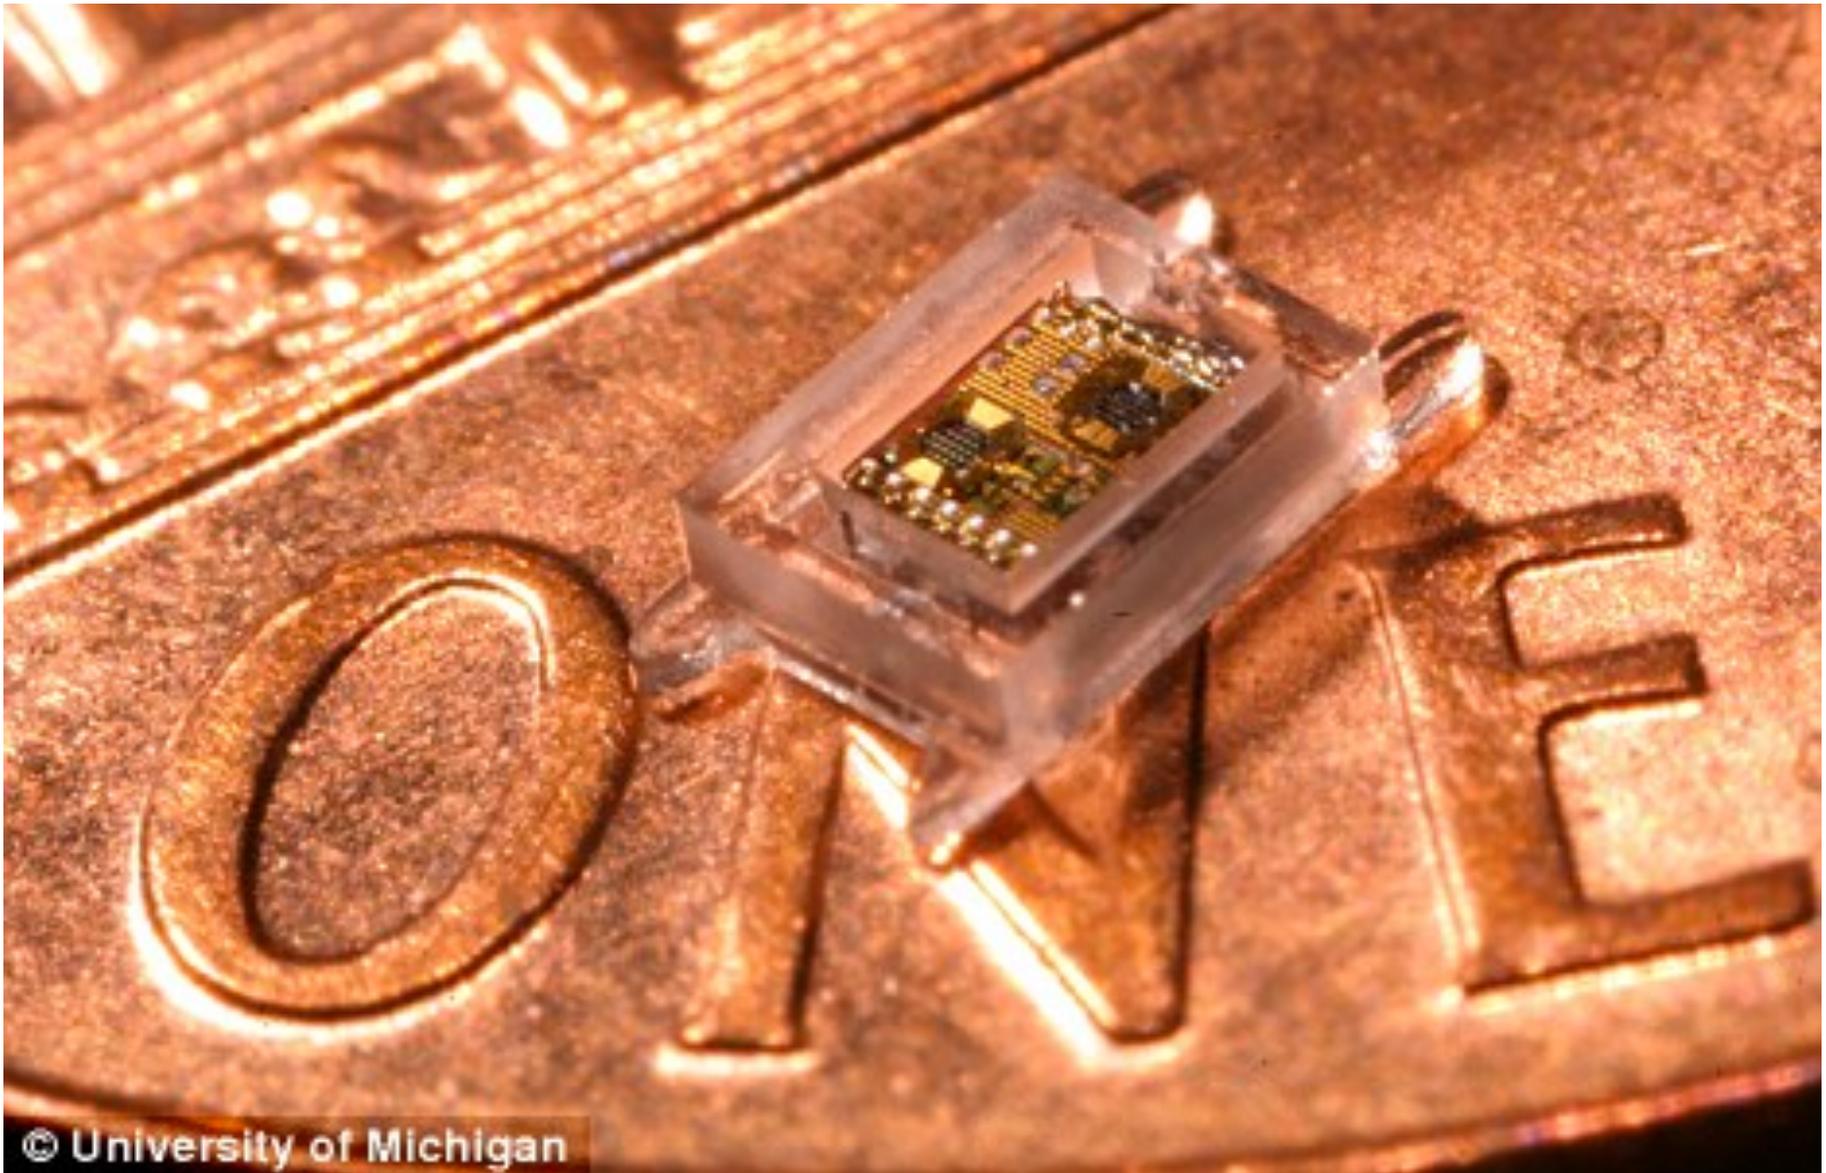

# Sensor Systems vs Standard or Mobile Systems

- Sensor nodes have limited computational resources and energy.
- Sensor nodes are prone to failures (especially because they are often deployed in challenging conditions).
- The topology of a sensor network might not change frequently:
  - Many deployments involve nodes with fixed locations.
  - Some deployments may have mobile sensors.

# Sensor Node

- A typical sensor node is composed of,
  - Sensing device
  - Low power radio
  - Small storage

Michigan Micro Mote

# What Operating System runs on a sensor?

- Operating system useful to simplify programming tasks and to allow more control over operations of the system
- But what can we do with such a constrained device?
- Given the kind of applications needed it is important to support concurrency... [frequent and parallel collection from different sensors]

# Energy Management

- Local computation does not consume significant amount of energy.
- **The main source of energy consumption is the radio.**
- Current draw on Telosb,
  - Microcontroller ON, Radio OFF 1.8mA
  - Microcontroller ON, Radio ON 21mA

# Energy Management

- In order to save energy, limit the number of radio transmissions.
- Idle listening consumes as much power as transmission.
- Current draw on Telosb,
  - Idle listening 23mA
  - Transmitting 21mA
- Idle listening is wasteful when average data rate is low.
- Switch off the radio when idle.
- Transmissions from other sensor nodes are lost.

# Radio Duty Cycling

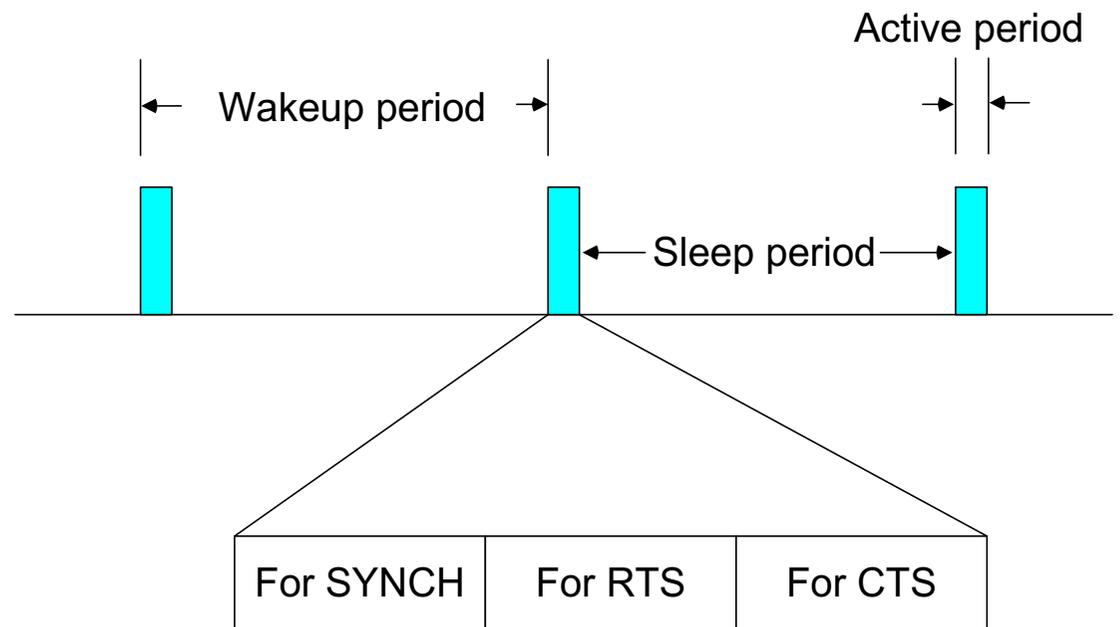

- Switch off the radio of all sensors at specific intervals:
  - Very precise synchronization.
  - Still probable idle time for sensors which do not communicate.
- More refined strategy:
  - Wave of switch off time depending on topology.
  - Still an overestimate of the communication needs of some sensors (traffic might be varying across the network).

# Dynamic duty cycling

- More refined strategies have been proposed which aim to allow sensors with more packets to stay awake longer and others to sleep more.
  - Synchronized (e.g. S-MAC)
  - Asynchronous (e.g. B-MAC, X-MAC)
- Synchronized protocols try to **negotiate a schedule** among neighboring nodes.
- Asynchronous protocols rely on **preamble sampling** to connect a transmitter to receivers.

# Sensor-MAC (S-MAC)

- Idea: Switch nodes off, ensure that neighboring nodes turn on simultaneously to allow packet exchange (rendez-vous)
  - Packet exchange occurs only in these **active periods**
  - Need to also exchange wakeup schedule between neighbors
  - When awake, essentially perform RTS/CTS
  - Use SYNCH, RTS, CTS phases

# S-MAC

- SYNC phase divided into time slots with CSMA and backoffs to send schedule to neighbours.
- Y chooses a slot and if no signal is received in this slot, it will transmit its schedule to X otherwise it will wait for next wake up of X.
- RTS phase: X listens for RTS packets (CSMA contention).
- CTS phase: X sends one and extends its wake up time.

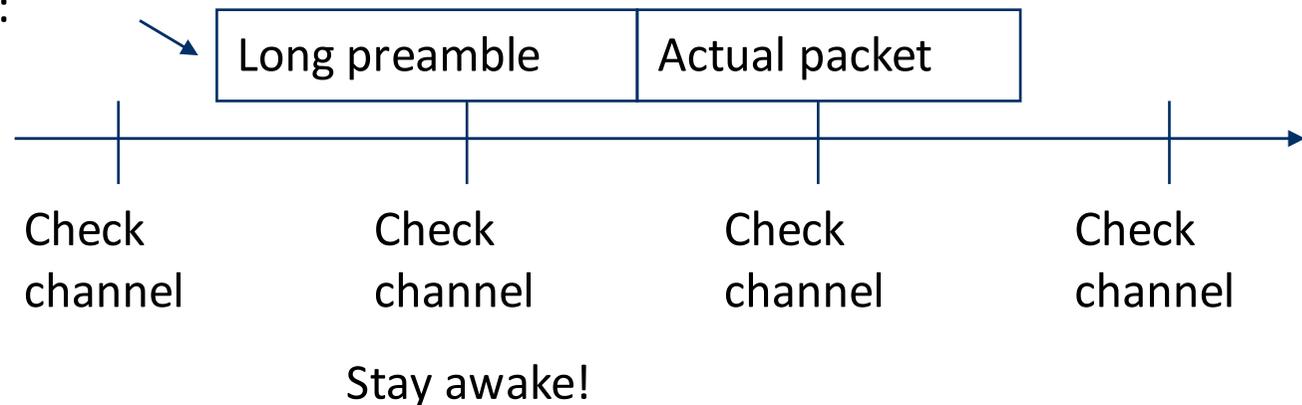

# S-MAC synchronized islands

- Nodes try to pick up schedule synchronization from neighboring nodes.
- If no neighbor found, nodes pick some schedule to start with.
- If additional nodes join, some node might learn about two different schedules from different nodes
  - “Synchronized islands”.
- To bridge this gap, it has to follow both schemes and use more energy.

# Preamble Sampling

- So far: Periodic sleeping supported by some means to synchronize wake up of nodes to ensure rendez-vous between sender and receiver.
- Alternative option: Don't try to explicitly synchronize nodes:
  - Have receiver sleep and only periodically sample the channel.
- Use **long preambles** to ensure that receiver stays awake to catch actual packet. Example: B-MAC and WiseMAC.

Start transmission:

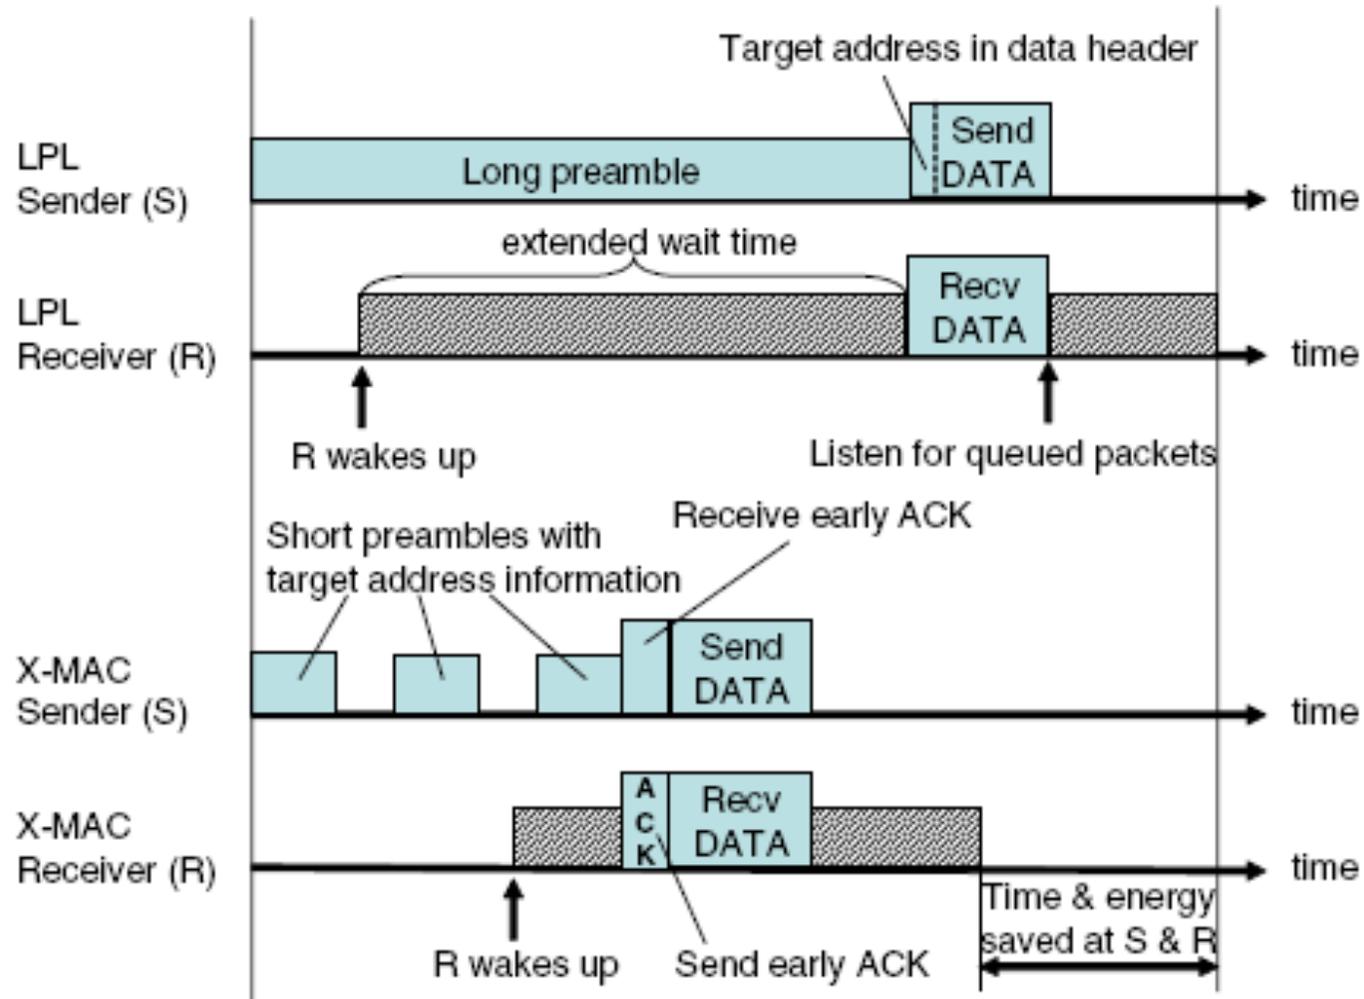

# Problems with this technique

- Overhearing
  - All receivers listening to the preamble have to stay awake to find out who is the intended receiver.
- Energy Consumption
  - Long preamble causes increased energy consumption at both the transmitter and the receiver.
- Latency
  - Long preamble introduces per-hop latency.

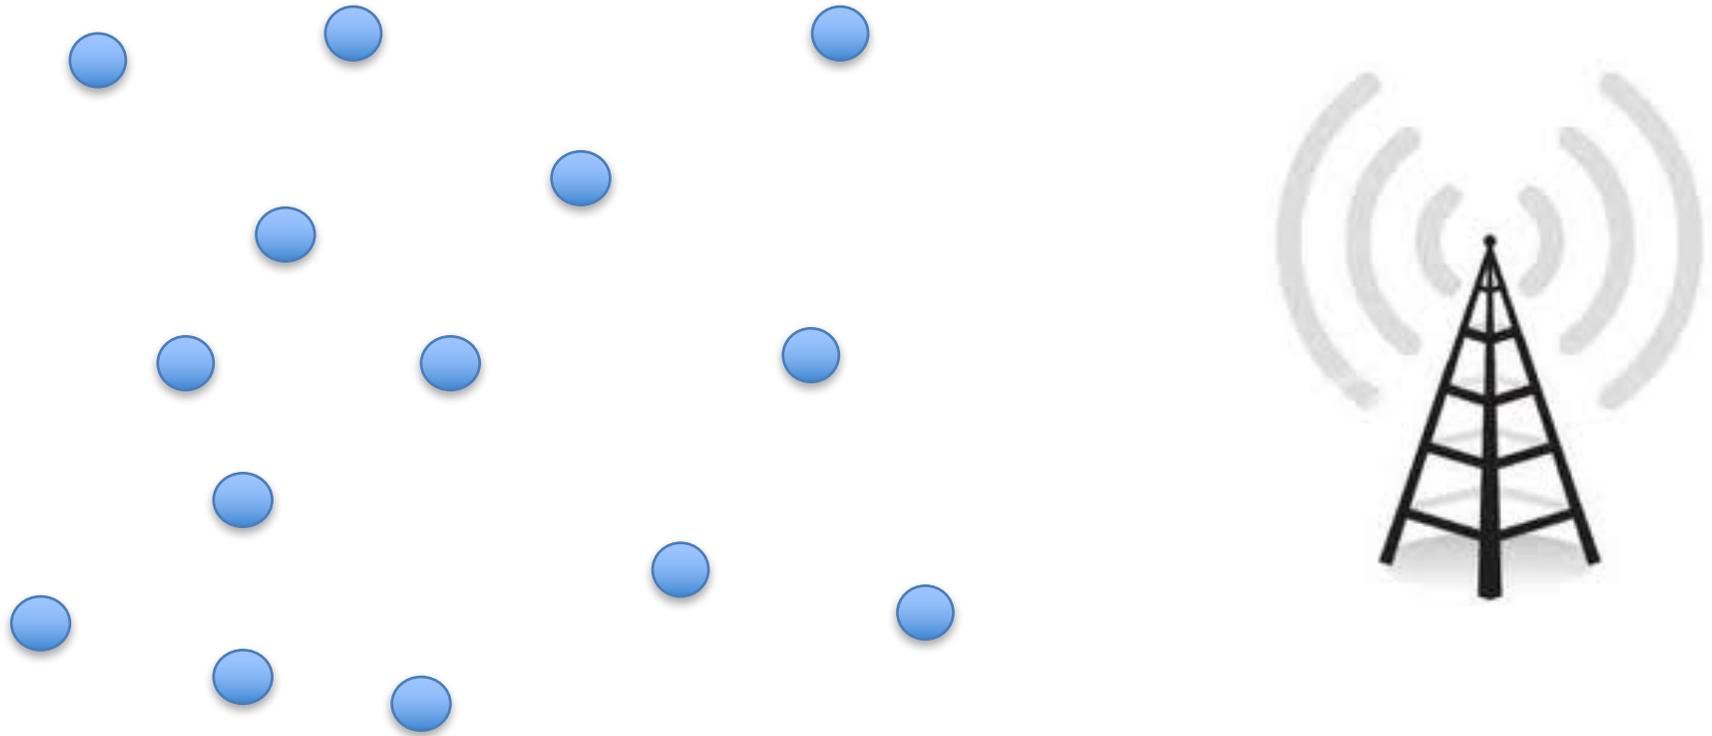

# X-MAC

- Short preamble
  - Reduce latency and reduce energy consumption
- Target in preamble
  - Minimize overhearing problem.
- Adding wait time between preambles
  - Reduces latency for the case where destination is awake before preamble completes.

# X-MAC

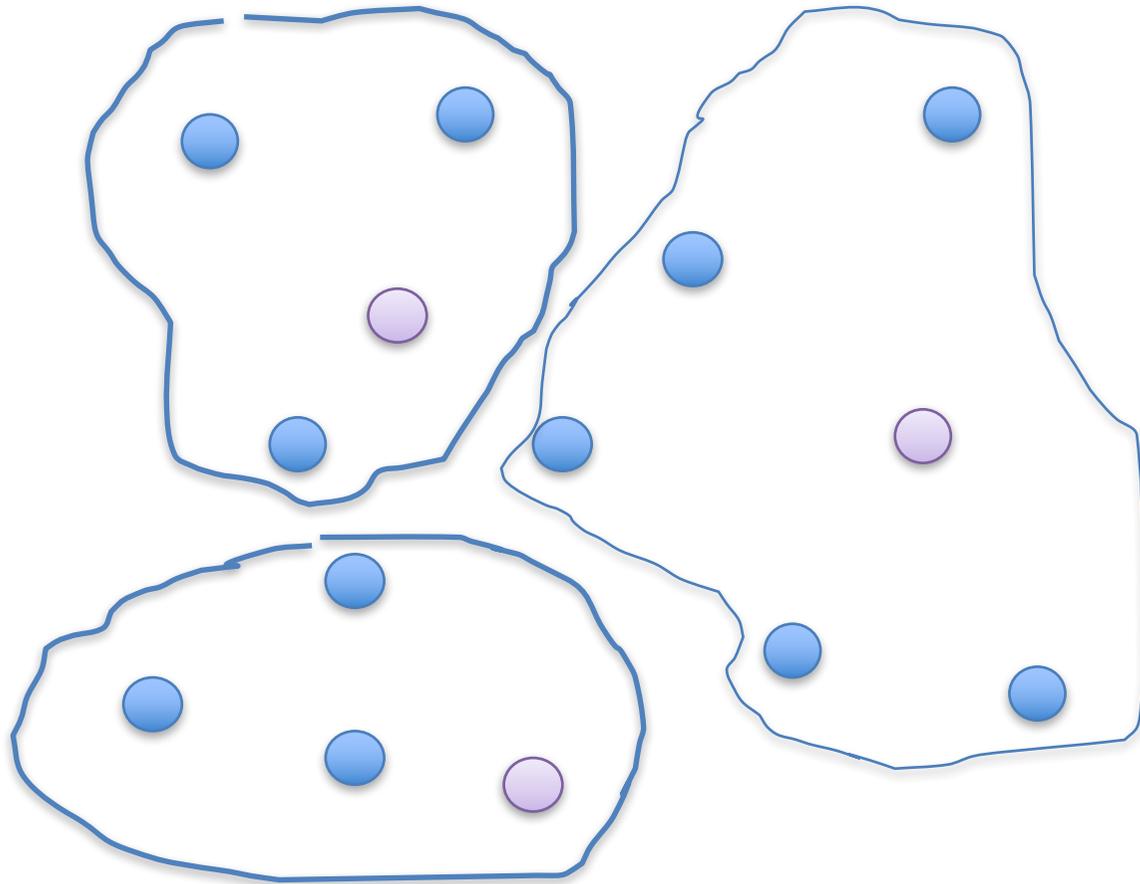

# Low-Energy Adaptive Clustering Hierarchy (LEACH)

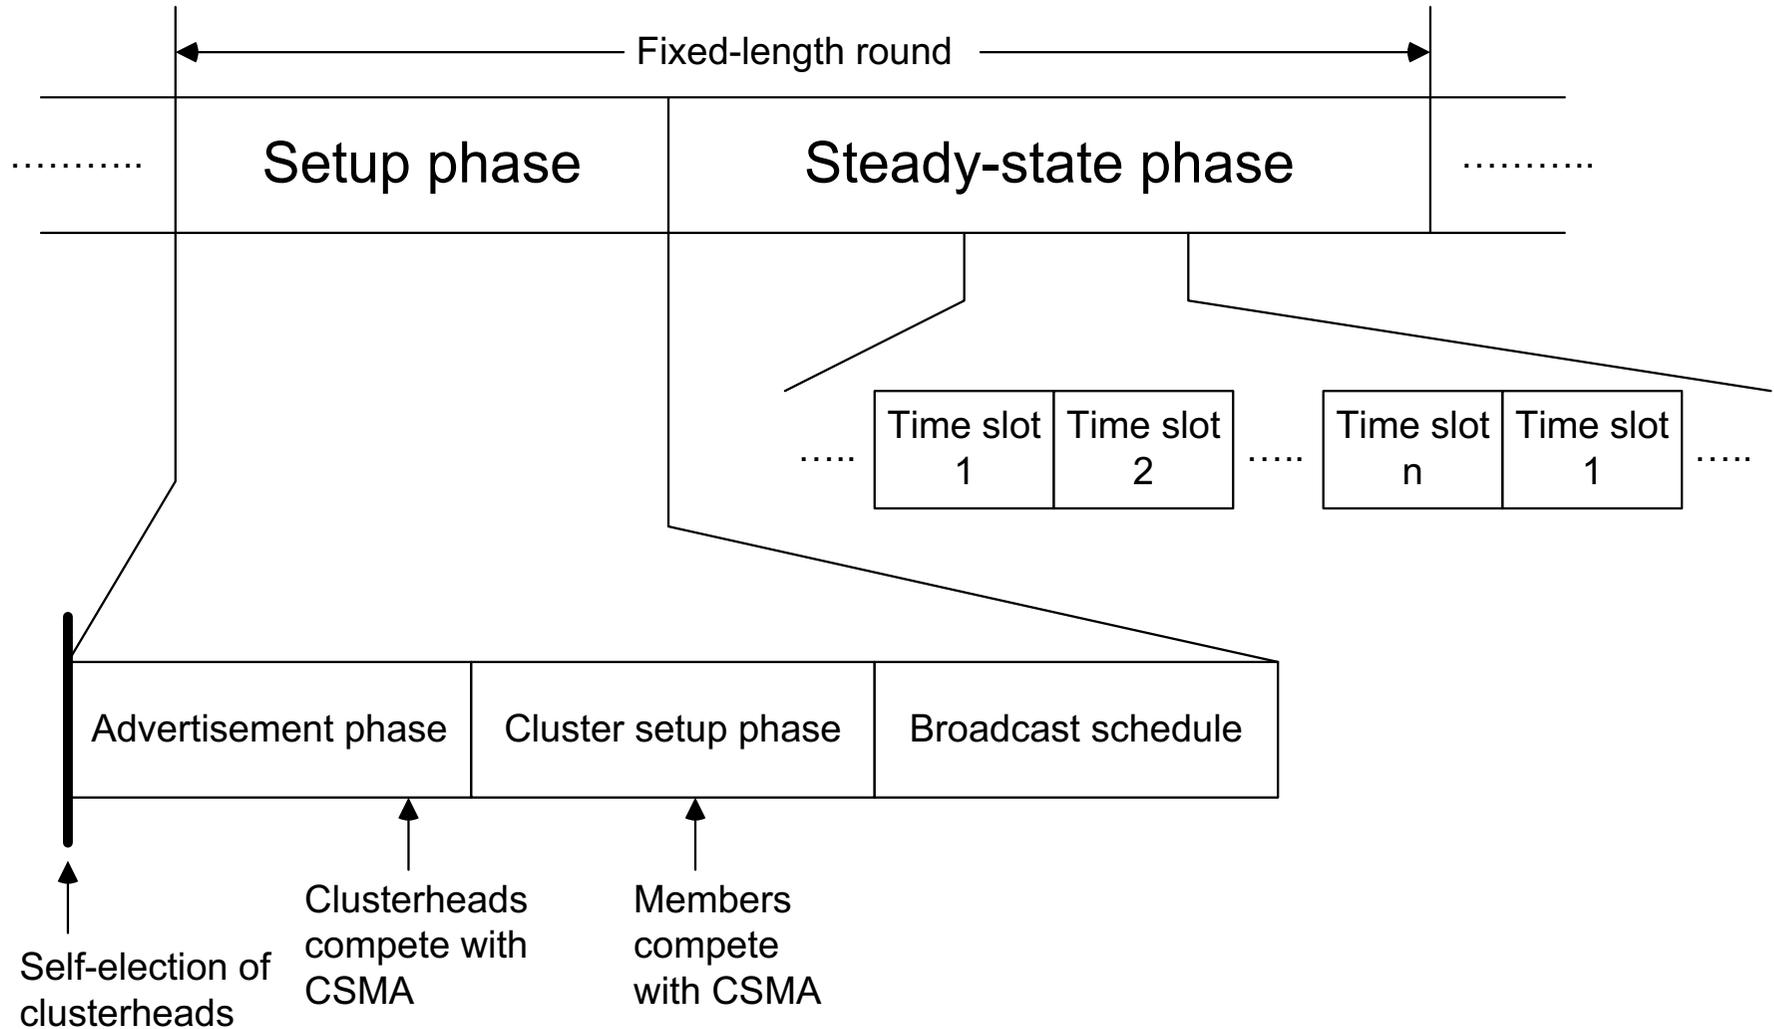

# Low-Energy Adaptive Clustering Hierarchy (LEACH)

- Assumption: dense network of nodes, reporting to a central sink, each node can reach sink **directly**.
- Idea: Group nodes into “**clusters**”, controlled by **clusterhead**:
  - Setup phase; details: later.
  - About 5% of nodes become clusterhead (depends on scenario).
  - Role of clusterhead is rotated to share the burden.
  - Clusterheads advertise themselves, ordinary nodes join CH with strongest signal.
  - Clusterheads organize: CDMA code for all member transmission. TDMA schedule to be used within a cluster
- In steady state operation:
  - CHs collect & aggregate data from all cluster members.
  - Report aggregated data to sink using CSMA.

# Low-Energy Adaptive Clustering Hierarchy (LEACH)

# LEACH rounds

# Summary

- We have described the characteristics of sensor systems and their challenges
- We have introduced MAC protocols for sensor systems
