Linear filtering (revision)

- ▶ Output pixel value is a weighted sum of neighboring pixels

The diagram shows the convolution equation $g(i, j) = \sum_{k, l} f(i - k, j - l)h(k, l)$ with several callout boxes. A box labeled 'Input pixel value' points to the function f . A box labeled 'Kernel (filter)' points to the function h . A box labeled 'Resulting pixel value' points to $g(i, j)$. A larger box labeled 'Sum over neighboring pixels, e.g. $k=-1, 0, 1, j=-1, 0, 1$ for 3x3 neighborhood' points to the summation symbol $\sum_{k, l}$.

$$g(i, j) = \sum_{k, l} f(i - k, j - l)h(k, l)$$

compact notation $g = f * h$

Convolution operation

Linear filter: example

$g(x,y)$

Why is the matrix g smaller than f ?

Padding an image

What is the computational cost of the convolution?

$$g(i, j) = \sum_{k, l} f(i - k, j - l)h(k, l)$$

- ▶ How many multiplications do we need to do to convolve 100x100 image with 9x9 kernel ?
 - ▶ The image is padded, but we do not compute the values for the padded pixels

Separable kernels

- ▶ Convolution operation can be made much faster if split into two separate steps:
 - ▶ 1) convolve all rows in the image with a 1D filter
 - ▶ 2) convolve columns in the result of 1) with another 1D filter
- ▶ But to do this, the kernel must be separable

$$\begin{bmatrix} h_{1,1} & h_{1,2} & h_{1,3} \\ h_{2,1} & h_{2,2} & h_{2,3} \\ h_{3,1} & h_{3,2} & h_{3,3} \end{bmatrix} = \begin{bmatrix} u_1 \\ u_2 \\ u_3 \end{bmatrix} \cdot \begin{bmatrix} v_1 & v_2 & v_3 \end{bmatrix}$$

$$\vec{h} = \vec{u} \cdot \vec{v}$$

Examples of separable filters

▶ **Box filter:**

$$\begin{bmatrix} \frac{1}{9} & \frac{1}{9} & \frac{1}{9} \\ \frac{1}{9} & \frac{1}{9} & \frac{1}{9} \\ \frac{1}{9} & \frac{1}{9} & \frac{1}{9} \end{bmatrix} = \begin{bmatrix} \frac{1}{3} \\ \frac{1}{3} \\ \frac{1}{3} \end{bmatrix} \cdot \begin{bmatrix} \frac{1}{3} & \frac{1}{3} & \frac{1}{3} \end{bmatrix}$$

▶ **Gaussian filter:**

$$G(x, y; \sigma) = \frac{1}{2\pi\sigma^2} e^{-\frac{x^2+y^2}{2\sigma^2}}$$

▶ What are the corresponding 1D components of this separable filter ($u(x)$ and $v(y)$)?

$$G(x, y) = u(x) \cdot v(y)$$

Unsharp masking

- ▶ How to use blurring to sharpen an image ?

results

original image

high-pass image

blurry image

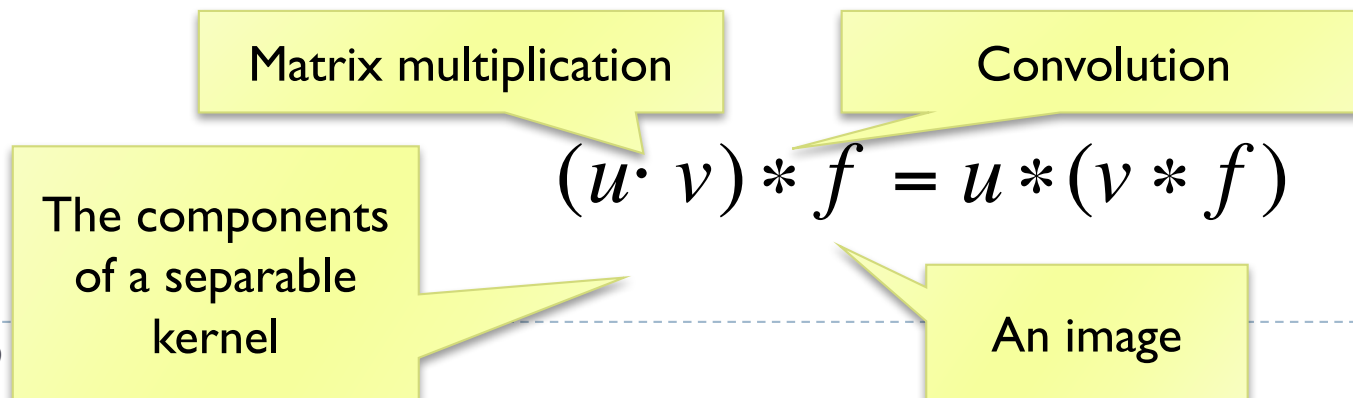

$$g_{\text{sharp}} = f + \gamma(f - h_{\text{blur}} * f)$$

Diagrammatic annotations: Blue arrows point from the 'results' image to the g_{sharp} term, from the 'original image' to the f term, from the 'high-pass image' to the $(f - h_{\text{blur}} * f)$ term, and from the 'blurry image' to the $h_{\text{blur}} * f$ term. Brackets are used to group the terms in the equation to show their relationship to the images above.

Why “linear” filters ?

- ▶ Linear functions have two properties:
 - ▶ Additivity: $f(x) + f(y) = f(x+y)$
 - ▶ Homogeneity: $f(a \cdot x) = a \cdot f(x)$ (where “f” is a linear function)
- ▶ Why is it important?
 - ▶ Linear operations can be performed in an arbitrary order
 - ▶ $\text{blur}(a \cdot F + b) = a \cdot \text{blur}(F) + b$
 - ▶ Linearity of the Gaussian filter could be used to improve the performance of your image processing operation
 - ▶ This is also how the separable filters work:

Edge stopping filters

Original

Edge-aware smoothing

Detail enhancement

Stylization

Recoloring

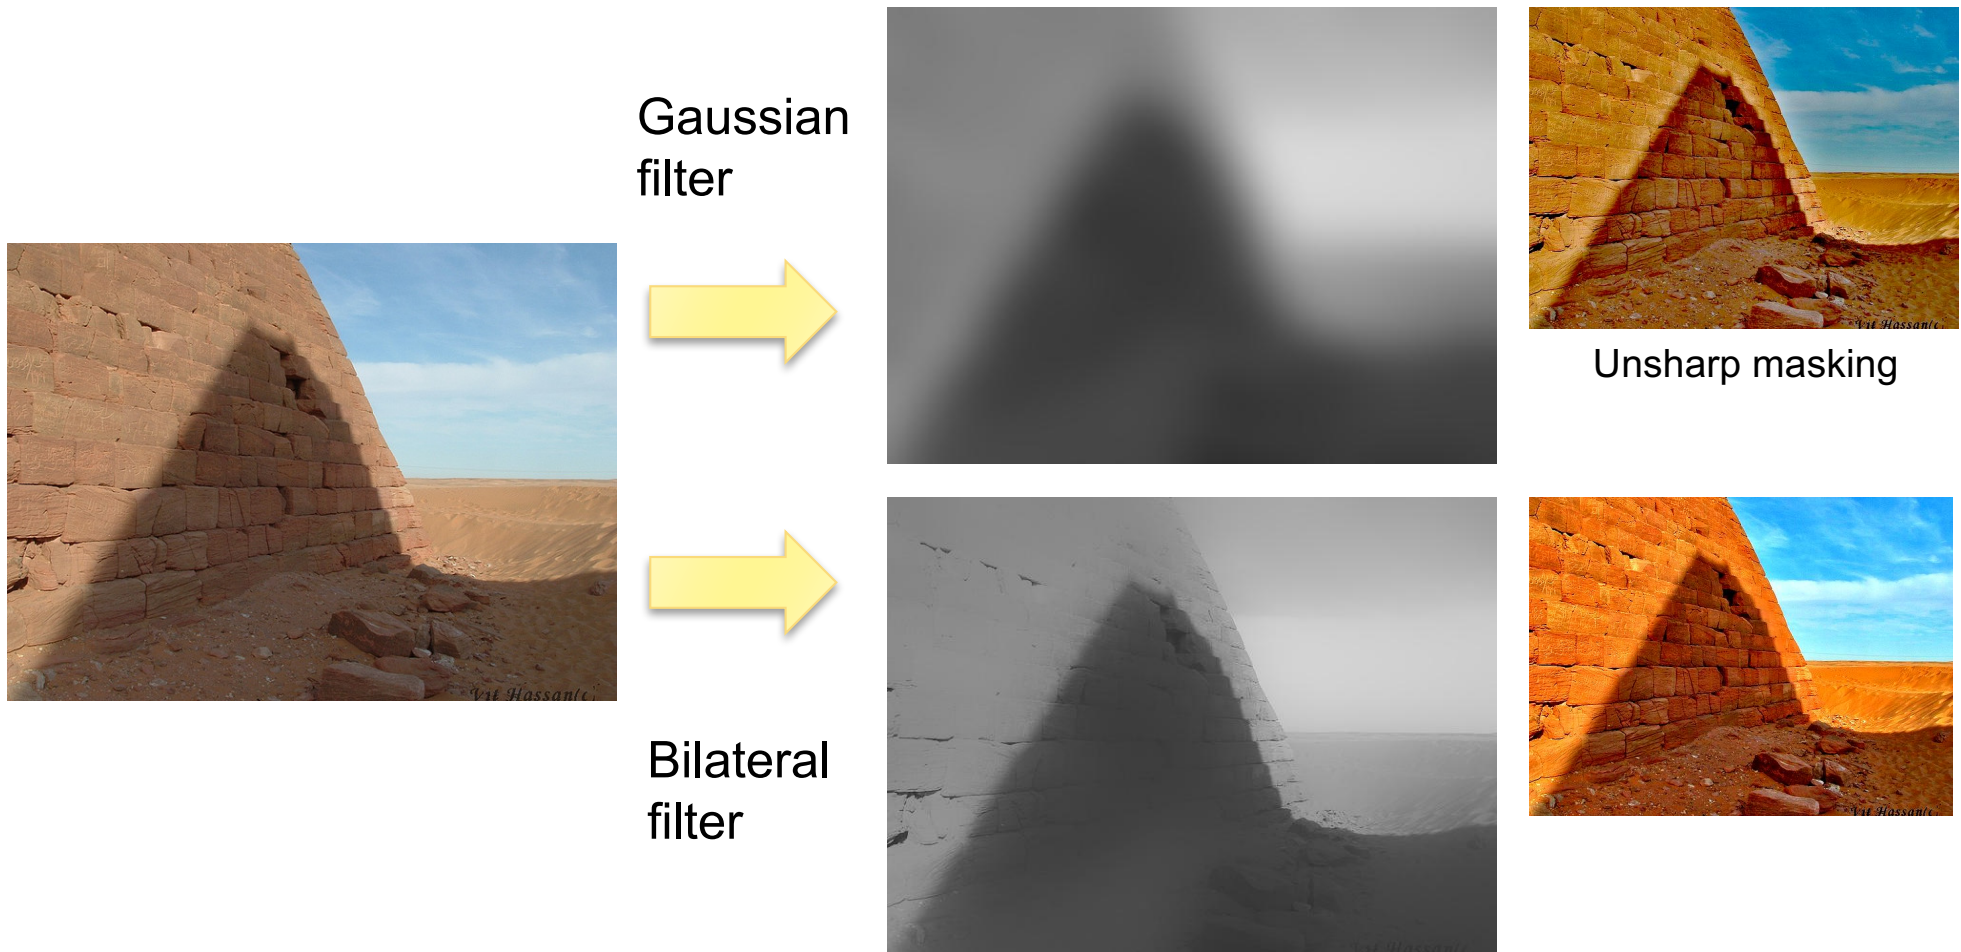

Pencil drawing

Depth-of-field

Nonlinear filters: Bilateral filter

- ▶ Goal: Smooth out the image without blurring edges

Bilateral filter

spatial kernel f

influence g in the intensity domain for the central pixel

=

weight $f \times g$ for the central pixel

“Kernel” changes from one pixel to another

Kernel for this pixel

output

=

*

input

Bilateral filter

Input image

$$y(\mathbf{p}) = \frac{\sum_{\mathbf{q} \in \Omega} x(\mathbf{q})w(\mathbf{p}, \mathbf{q})}{\sum_{\mathbf{q} \in \Omega} w(\mathbf{p}, \mathbf{q})}$$

Pixel coordinates
 $\mathbf{p} = (i, j)$

Neighborhood of the pixel \mathbf{p}

$$w(\mathbf{p}, \mathbf{q}) = g_s(\mathbf{p} - \mathbf{q})g_r(x(\mathbf{p}) - x(\mathbf{q}))$$

distance in the spatial position (x,y) distance (difference) in pixel values

$$g_s(\mathbf{d}) = \exp\left(\frac{-\|\mathbf{d}\|_2}{2\sigma_s^2}\right) \quad g_r(d) = \exp\left(\frac{-d^2}{2\sigma_s^2}\right)$$

How to make the bilateral filter fast?

- ▶ A number of approximations have been proposed
 - ▶ Combination of linear filters [Durand & Dorsey 2002, Yang et al. 2009]
 - ▶ Bilateral grid [Chen et al. 2007]
 - ▶ Permutohedral lattice [Adams et al. 2010]
 - ▶ Domain transform [Gastal & Oliveira 2011]

Joint-bilateral filter

- ▶ The “range” term does not need to operate in the same domain as the filter output

- ▶ Example:

Stereo image pair

Estimated left-to-right disparity

The “spatial”
term operates
on disparities

The “range”
term operates
on the colour
image

Joint bilateral
filter

Filtered disparity

A simplified
algorithm from
[Mueller et al. 2010]

Joint bilateral filter: Flash / no-flash

Flash

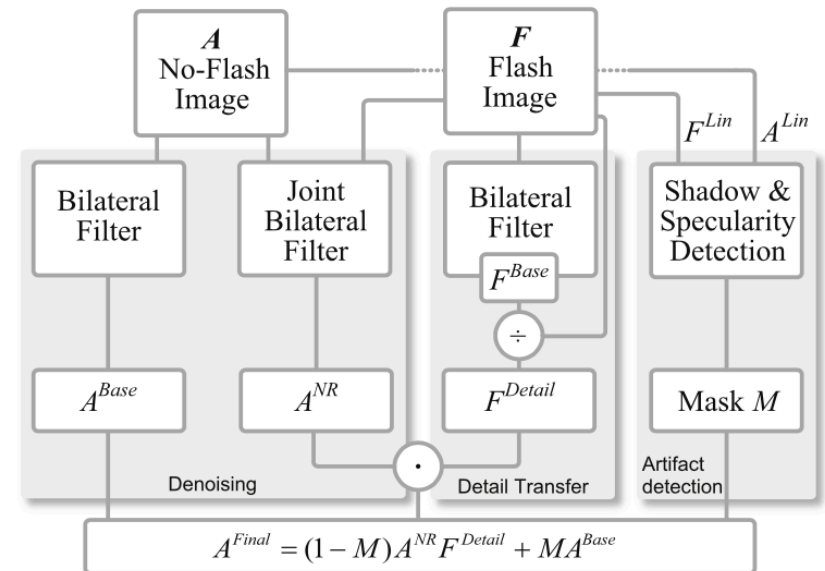

No-flash

Detail transfer with denoising

- ▶ Preserve colour and illumination from the no-flash image
- ▶ Use flash image to remove noise and add details
- ▶ [Petshnigg et al. 2004]

Example of edge preserving filtering

- ▶ Domain Transform for Edge-Aware Image and Video Processing
- ▶ Video:
 - ▶ <https://youtu.be/UllxhIIQrTY?t=4m10s>
 - ▶ From: <http://inf.ufrgs.br/~eslgastal/DomainTransform/>

Optimization-based methods

sources/destinations

cloning

seamless cloning

Poisson image editing [Perez et al. 2003]

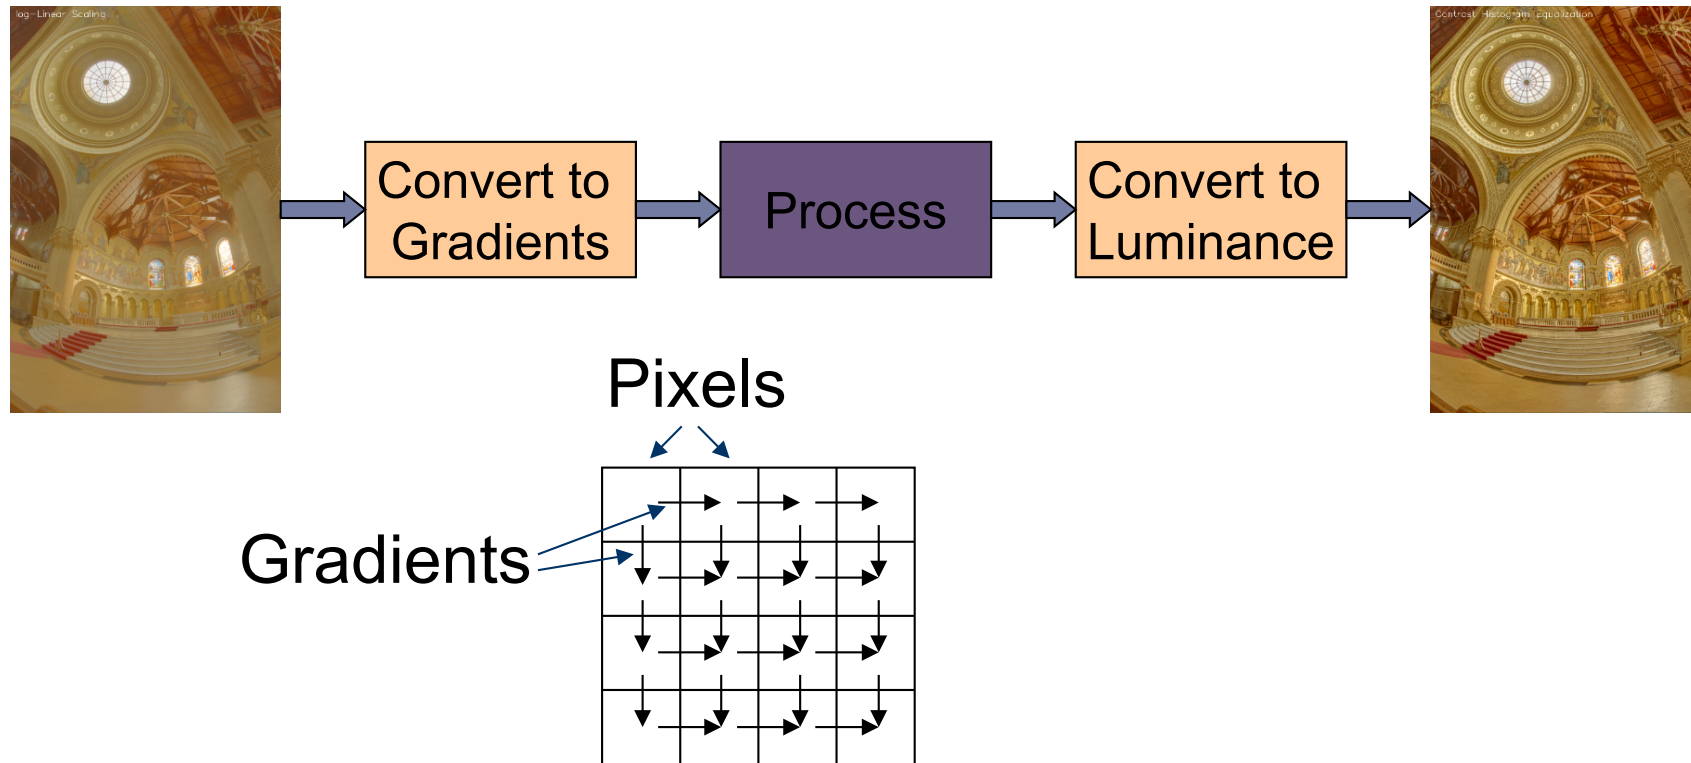

Gradient Domain compositing

- ▶ Compositing [Wang et al. 2004]

Gradient domain methods

- ▶ Operate on pixel gradients instead of pixel values

Forward Transformation

- ▶ Forward Transformation

- ▶ Compute gradients as differences between a pixel and its two neighbors

$$\nabla I_{x,y} = \begin{bmatrix} I_{x+1,y} - I_{x,y} \\ I_{x,y+1} - I_{x,y} \end{bmatrix}$$

- ▶ Result: 2D gradient map (2 x more values than the number of pixels)

Processing gradient field

- ▶ Usually gradient magnitudes are modified while gradient direction (angle) remains the same

Gradient editing function

$$G_{x,y} = \nabla I_{x,y} \cdot f(\|\nabla I_{x,y}\|)$$

- ▶ Examples of gradient editing functions:

Inverse transform: the difficult part

- ▶ There is no straightforward transformation from gradients to luminance

- Instead, a minimization problem is solved:

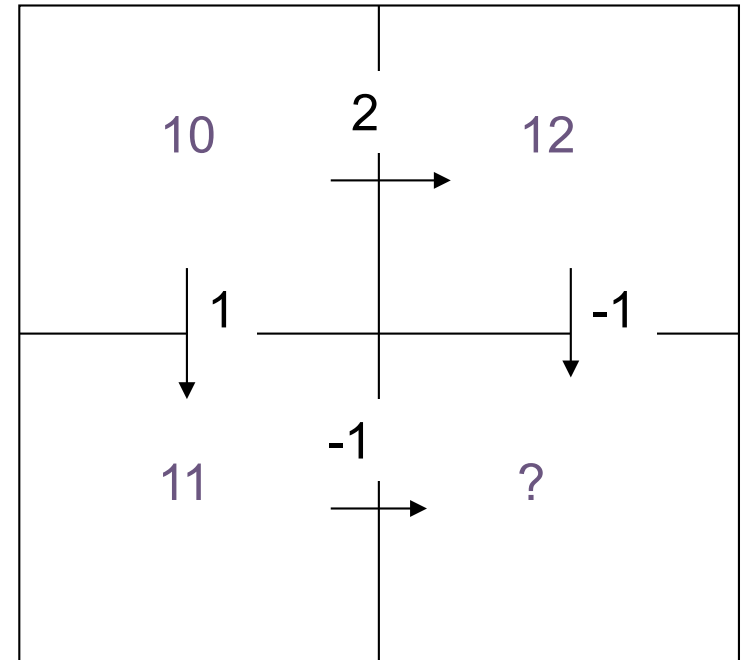

$$\arg \min_I \sum_{x,y} \left[\left(I_{x+1,y} - I_{x,y} - G_{x,y}^{(x)} \right)^2 + \left(I_{x,y+1} - I_{x,y} - G_{x,y}^{(y)} \right)^2 \right]$$

Image Pixels

Desired gradients

Inverse transformation

- ▶ Convert modified gradients to pixel values
 - ▶ Not trivial!
 - ▶ Most gradient fields are inconsistent - do not produce valid images
 - ▶ If no accurate solution is available, take the best possible solution
 - ▶ Analogy: system of springs

Gradient field reconstruction: derivation

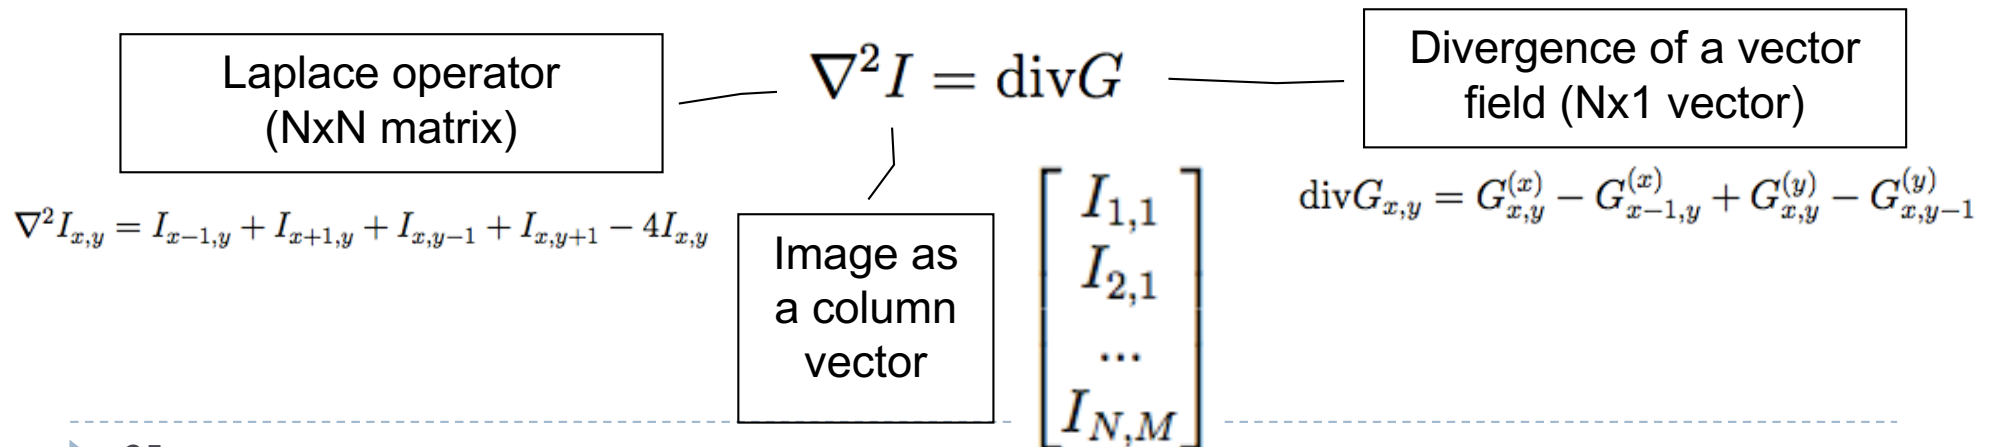

- ▶ The minimization problem is given by:

$$\arg \min_I \sum_{x,y} \left[\left(I_{x+1,y} - I_{x,y} - G_{x,y}^{(x)} \right)^2 + \left(I_{x,y+1} - I_{x,y} - G_{x,y}^{(y)} \right)^2 \right]$$

- ▶ After equating derivatives over pixel values to 0 we get:
 - ▶ Derivation done in the lecture

$$I_{x-1,y} + I_{x+1,y} + I_{x,y-1} + I_{x,y+1} - 4I_{x,y} = G_{x,y}^{(x)} - G_{x-1,y}^{(x)} + G_{x,y}^{(y)} - G_{x,y-1}^{(y)}$$

- ▶ In matrix notation:

Laplace operator for 3x3 image

$$\nabla^2 = \begin{bmatrix} -2 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & -3 & 1 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & -2 & 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 0 & -3 & 1 & 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 1 & -4 & 1 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 & -3 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 & 0 & 0 & -2 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 1 & -3 & 1 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & -2 \end{bmatrix}$$

Solving sparse linear systems

- ▶ Just use “\” operator in Matlab / Octave:
 - ▶ $x = A \setminus b;$
- ▶ Great “cookbook”:
 - ▶ TEUKOLSKY, S.A., FLANNERY, B.P., PRESS, W.H., AND VETTERLING, W.T. 1992. *Numerical recipes in C*. Cambridge University Press, Cambridge.
- ▶ Some general methods
 - ▶ Cosine-transform – fast but cannot work with weights (next slides) and may suffer from floating point precision errors
 - ▶ Multi-grid – fast, difficult to implement, not very flexible
 - ▶ Conjugate gradient / bi-conjugate gradient – general, memory efficient, iterative but fast converging

Pinching artefacts

- ▶ A common problem of gradient-based methods is that they may result in “pinching” artefacts (left image)
- ▶ Such artefacts can be avoided by introducing weights to the optimization problem

Weighted gradients

- ▶ The new objective function is:

$$\arg \min_I \sum_{x,y} \left[w_{x,y}^{(x)} (I_{x+1,y} - I_{x,y} - G_{x,y}^{(x)})^2 + w_{x,y}^{(y)} (I_{x,y+1} - I_{x,y} - G_{x,y}^{(y)})^2 \right]$$

- ▶ so that higher weights are assigned to low gradient magnitudes (in the original image).

$$w_{x,y}^{(x)} = w_{x,y}^{(y)} = \frac{1}{\|\nabla I_{x,y}^{(o)}\| + \epsilon}$$

- ▶ The linear system can be derived again
 - ▶ but this is a lot of work and is error-prone

Least-squares – matrix notation

- ▶ Given an error function (in the matrix notation):

$$F = (Ax - b)'(Ax - b)$$

- ▶ It's derivative is given by:

$$\frac{\partial F}{\partial x} = 2 A' Ax - 2 A' b$$

- ▶ See for example 15.4 in Numerical Recipes

Weighted gradients - matrix notation (1)

- ▶ The objective function:

$$\arg \min_I \sum_{x,y} \left[w_{x,y}^{(x)} (I_{x+1,y} - I_{x,y} - G_{x,y}^{(x)})^2 + w_{x,y}^{(y)} (I_{x,y+1} - I_{x,y} - G_{x,y}^{(y)})^2 \right]$$

- ▶ In the matrix notation:

$$\arg \min_I (W \nabla_x I - W G^{(x)})' (W \nabla_x I - W G^{(x)}) + (W \nabla_y I - W G^{(y)})' (W \nabla_y I - W G^{(y)}).$$

- ▶ Gradient operators (for 3x3 pixel image):

$$\nabla_x = \begin{bmatrix} -1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & -1 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & -1 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\nabla_y = \begin{bmatrix} -1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & -1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & -1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & -1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & -1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Weighted gradients - matrix notation (2)

- ▶ The objective function again:

$$\arg \min_I (W \nabla_x I - W G^{(x)})' (W \nabla_x I - W G^{(x)}) + \\ (W \nabla_y I - W G^{(y)})' (W \nabla_y I - W G^{(y)}).$$

- ▶ Derivates with respect to I:

$$\frac{\partial E}{\partial I} = 2 (W \nabla_x)' W G^{(x)} + 2 (W \nabla_y)' W G^{(y)} \\ - 2 [(W \nabla_x)'(W \nabla_x) + (W \nabla_y)'(W \nabla_y)] I$$

$$F = (Ax - b)'(Ax - b)$$

$$\frac{\partial F}{\partial x} = 2 A' Ax - 2 A' b$$

- ▶ The equation above can be solved using a sparse matrix solver

WLS filter: Edge stopping filter by optimization

▶ Weighted-least-squares optimization

Make reconstructed image u possibly close to input g

Smooth out the image by making partial derivatives close to 0

$$\operatorname{argmin}_{\mathbf{u}} \sum_p \left((u_p - g_p)^2 + \lambda \left(a_{x,p}(g) \left(\frac{\partial u}{\partial x} \right)_p^2 + a_{y,p}(g) \left(\frac{\partial u}{\partial y} \right)_p^2 \right) \right)$$

$$a_{x,p}(g) = \frac{1}{\left| \frac{\partial u}{\partial x} (g) \right|^\alpha + \epsilon}$$

Spatially varying smoothing – less smoothing near the edges

▶ [Farbman et al., SIGGRAPH 2008]

Poisson image editing

$$\min_f \iint_{\Omega} |\nabla f - \mathbf{v}|^2 \quad \text{subject to:} \quad f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

- ▶ Reconstruct unknown values f given a source guidance gradient field \mathbf{v} and the boundary conditions $f|_{\partial\Omega} = f^*|_{\partial\Omega}$
- ▶ [Perez et al. 2003]

Color 2 Gray

- ▶ Transform color images to gray scale
- ▶ Preserve color saliency
 - ▶ When gradient in luminance close to 0
 - ▶ Replace it with gradient in chrominance
 - ▶ Reconstruct an image from gradients
- ▶ [Gooch et al. 2005]

Gradient Domain: applications

- ▶ **More applications:**
 - ▶ Lightness perception (Retinex) [Horn 1974]
 - ▶ Matting [Sun et al. 2004]
 - ▶ Color to gray mapping [Gooch et al. 2005]
 - ▶ Video Editing [Perez et al. 2003, Agarwala et al. 2004]
 - ▶ Photoshop's Healing Brush [Georgiev 2005]
