Outline

Introduction

Vertex Cover

The Set-Covering Problem

Motivation

Many fundamental problems are **NP-complete**, yet they are too important to be abandoned.

Many fundamental problems are **NP-complete**, yet they are too important to be abandoned.

Examples: HAMILTON, 3-SAT, VERTEX-COVER, KNAPSACK,...

Many fundamental problems are **NP-complete**, yet they are too important to be abandoned.

Examples: HAMILTON, 3-SAT, VERTEX-COVER, KNAPSACK,...

Strategies to cope with NP-complete problems

1. If inputs (or solutions) are small, an algorithm with **exponential running time** may be satisfactory.
2. Isolate important **special cases** which can be solved in polynomial-time.
3. Develop algorithms which find **near-optimal** solutions in polynomial-time.

Many fundamental problems are **NP-complete**, yet they are too important to be abandoned.

Examples: HAMILTON, 3-SAT, VERTEX-COVER, KNAPSACK,...

Strategies to cope with NP-complete problems

1. If inputs (or solutions) are small, an algorithm with **exponential running time** may be satisfactory.
2. Isolate important **special cases** which can be solved in polynomial-time.
3. **Develop algorithms which find near-optimal solutions in polynomial-time.**

Many fundamental problems are **NP-complete**, yet they are too important to be abandoned.

Examples: HAMILTON, 3-SAT, VERTEX-COVER, KNAPSACK,...

Strategies to cope with NP-complete problems

1. If inputs (or solutions) are small, an algorithm with **exponential running time** may be satisfactory.
2. Isolate important **special cases** which can be solved in polynomial-time.
3. **Develop algorithms which find near-optimal solutions in polynomial-time.**

We will call these **approximation algorithms**.

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

This covers both **maximization** and **minimization** problems.

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

- **Maximization** problem: $\frac{C^*}{C} \geq 1$

This covers both **maximization** and **minimization** problems.

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

- **Maximization** problem: $\frac{C^*}{C} \geq 1$
- **Minimization** problem: $\frac{C}{C^*} \geq 1$

This covers both **maximization** and **minimization** problems.

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

- **Maximization** problem: $\frac{C^*}{C} \geq 1$
- **Minimization** problem: $\frac{C}{C^*} \geq 1$

This covers both **maximization** and **minimization** problems.

For many problems: **tradeoff** between **runtime** and **approximation ratio**.

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

- **Maximization** problem: $\frac{C^*}{C} \geq 1$
- **Minimization** problem: $\frac{C}{C^*} \geq 1$

This covers both **maximization** and **minimization** problems.

For many problems: **tradeoff** between **runtime** and **approximation ratio**.

Approximation Schemes

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

- **Maximization** problem: $\frac{C^*}{C} \geq 1$
- **Minimization** problem: $\frac{C}{C^*} \geq 1$

This covers both **maximization** and **minimization** problems.

For many problems: **tradeoff** between **runtime** and **approximation ratio**.

Approximation Schemes

An **approximation scheme** is an approximation algorithm, which given any input and $\epsilon > 0$, is a $(1 + \epsilon)$ -approximation algorithm.

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

- **Maximization** problem: $\frac{C^*}{C} \geq 1$
- **Minimization** problem: $\frac{C}{C^*} \geq 1$

This covers both **maximization** and **minimization** problems.

For many problems: **tradeoff** between **runtime** and **approximation ratio**.

Approximation Schemes

An **approximation scheme** is an approximation algorithm, which given any input and $\epsilon > 0$, is a $(1 + \epsilon)$ -approximation algorithm.

- It is a **polynomial-time approximation scheme** (PTAS) if for any fixed $\epsilon > 0$, the runtime is polynomial in n .

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

- **Maximization** problem: $\frac{C^*}{C} \geq 1$
- **Minimization** problem: $\frac{C}{C^*} \geq 1$

This covers both **maximization** and **minimization** problems.

For many problems: **tradeoff** between **runtime** and **approximation ratio**.

Approximation Schemes

An **approximation scheme** is an approximation algorithm, which given any input and $\epsilon > 0$, is a $(1 + \epsilon)$ -approximation algorithm.

- It is a **polynomial-time approximation scheme** (PTAS) if for any fixed $\epsilon > 0$, the runtime is polynomial in n . For example, $O(n^{2/\epsilon})$.

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

- **Maximization** problem: $\frac{C^*}{C} \geq 1$
- **Minimization** problem: $\frac{C}{C^*} \geq 1$

This covers both **maximization** and **minimization** problems.

For many problems: **tradeoff** between **runtime** and **approximation ratio**.

Approximation Schemes

An **approximation scheme** is an approximation algorithm, which given any input and $\epsilon > 0$, is a $(1 + \epsilon)$ -approximation algorithm.

- It is a **polynomial-time approximation scheme** (PTAS) if for any fixed $\epsilon > 0$, the runtime is polynomial in n . (For example, $O(n^{2/\epsilon})$.)
- It is a **fully polynomial-time approximation scheme** (FPTAS) if the runtime is polynomial in both $1/\epsilon$ and n .

Performance Ratios for Approximation Algorithms

Approximation Ratio

An algorithm for a problem has **approximation ratio** $\rho(n)$, if for any input of size n , the cost C of the returned solution and optimal cost C^* satisfy:

$$\max\left(\frac{C}{C^*}, \frac{C^*}{C}\right) \leq \rho(n).$$

- **Maximization** problem: $\frac{C^*}{C} \geq 1$
- **Minimization** problem: $\frac{C}{C^*} \geq 1$

This covers both **maximization** and **minimization** problems.

For many problems: **tradeoff** between **runtime** and **approximation ratio**.

Approximation Schemes

An **approximation scheme** is an approximation algorithm, which given any input and $\epsilon > 0$, is a $(1 + \epsilon)$ -approximation algorithm.

- It is a **polynomial-time approximation scheme (PTAS)** if for any fixed $\epsilon > 0$, the runtime is polynomial in n . (For example, $O(n^{2/\epsilon})$.)
- It is a **fully polynomial-time approximation scheme (FPTAS)** if the runtime is polynomial in both $1/\epsilon$ and n . (For example, $O((1/\epsilon)^2 \cdot n^3)$.)

Outline

Introduction

Vertex Cover

The Set-Covering Problem

The Vertex-Cover Problem

Vertex Cover Problem

- **Given:** Undirected graph $G = (V, E)$
- **Goal:** Find a minimum-cardinality subset $V' \subseteq V$ such that if $(u, v) \in E(G)$, then $u \in V'$ or $v \in V'$.

The Vertex-Cover Problem

Vertex Cover Problem

- **Given:** Undirected graph $G = (V, E)$
- **Goal:** Find a minimum-cardinality subset $V' \subseteq V$ such that if $(u, v) \in E(G)$, then $u \in V'$ or $v \in V'$.

The Vertex-Cover Problem

Vertex Cover Problem

- **Given:** Undirected graph $G = (V, E)$
- **Goal:** Find a minimum-cardinality subset $V' \subseteq V$ such that if $(u, v) \in E(G)$, then $u \in V'$ or $v \in V'$.

The Vertex-Cover Problem

We are covering edges by picking vertices!

Vertex Cover Problem

- **Given:** Undirected graph $G = (V, E)$
- **Goal:** Find a minimum-cardinality subset $V' \subseteq V$ such that if $(u, v) \in E(G)$, then $u \in V'$ or $v \in V'$.

The Vertex-Cover Problem

We are covering **edges** by picking **vertices**!

Vertex Cover Problem

- **Given:** Undirected graph $G = (V, E)$
- **Goal:** Find a minimum-cardinality subset $V' \subseteq V$ such that if $(u, v) \in E(G)$, then $u \in V'$ or $v \in V'$.

This is an NP-hard problem.

The Vertex-Cover Problem

We are covering **edges** by picking **vertices**!

Vertex Cover Problem

- **Given:** Undirected graph $G = (V, E)$
- **Goal:** Find a minimum-cardinality subset $V' \subseteq V$ such that if $(u, v) \in E(G)$, then $u \in V'$ or $v \in V'$.

This is an NP-hard problem.

Applications:

The Vertex-Cover Problem

We are covering **edges** by picking **vertices**!

Vertex Cover Problem

- **Given:** Undirected graph $G = (V, E)$
- **Goal:** Find a minimum-cardinality subset $V' \subseteq V$ such that if $(u, v) \in E(G)$, then $u \in V'$ or $v \in V'$.

This is an NP-hard problem.

Applications:

- Every **edge** forms a **task**, and every **vertex** represents a **person/machine** which can execute that task

The Vertex-Cover Problem

We are covering **edges** by picking **vertices**!

Vertex Cover Problem

- **Given:** Undirected graph $G = (V, E)$
- **Goal:** Find a minimum-cardinality subset $V' \subseteq V$ such that if $(u, v) \in E(G)$, then $u \in V'$ or $v \in V'$.

This is an NP-hard problem.

Applications:

- Every **edge** forms a **task**, and every **vertex** represents a **person/machine** which can execute that task
- Perform all tasks with the **minimal amount of resources**

The Vertex-Cover Problem

We are covering **edges** by picking **vertices**!

Vertex Cover Problem

- **Given:** Undirected graph $G = (V, E)$
- **Goal:** Find a minimum-cardinality subset $V' \subseteq V$ such that if $(u, v) \in E(G)$, then $u \in V'$ or $v \in V'$.

This is an NP-hard problem.

Applications:

- Every **edge** forms a **task**, and every **vertex** represents a **person/machine** which can execute that task
- Perform all tasks with the **minimal amount of resources**
- **Extensions:** weighted vertices or hypergraphs (\rightsquigarrow Set-Covering Problem)

Exercise: Be creative and design your own algorithm for VERTEX-COVER!

An Approximation Algorithm based on Greedy

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

An Approximation Algorithm based on Greedy

APPROX-VERTEX-COVER(G)

- 1 $C = \emptyset$
- 2 $E' = G.E$
- 3 **while** $E' \neq \emptyset$
- 4 let (u, v) be an arbitrary edge of E'
- 5 $C = C \cup \{u, v\}$
- 6 remove from E' every edge incident on either u or v
- 7 **return** C

An Approximation Algorithm based on Greedy

APPROX-VERTEX-COVER(G)

- 1 $C = \emptyset$
- 2 $E' = G.E$
- 3 **while** $E' \neq \emptyset$
- 4 let (u, v) be an arbitrary edge of E'
- 5 $C = C \cup \{u, v\}$
- 6 remove from E' every edge incident on either u or v
- 7 **return** C

An Approximation Algorithm based on Greedy

APPROX-VERTEX-COVER(G)

- 1 $C = \emptyset$
- 2 $E' = G.E$
- 3 **while** $E' \neq \emptyset$
- 4 let (u, v) be an arbitrary edge of E'
- 5 $C = C \cup \{u, v\}$
- 6 remove from E' every edge incident on either u or v
- 7 **return** C

An Approximation Algorithm based on Greedy

APPROX-VERTEX-COVER(G)

- 1 $C = \emptyset$
- 2 $E' = G.E$
- 3 **while** $E' \neq \emptyset$
- 4 let (u, v) be an arbitrary edge of E'
- 5 $C = C \cup \{u, v\}$
- 6 remove from E' every edge incident on either u or v
- 7 **return** C

An Approximation Algorithm based on Greedy

APPROX-VERTEX-COVER(G)

- 1 $C = \emptyset$
- 2 $E' = G.E$
- 3 **while** $E' \neq \emptyset$
- 4 let (u, v) be an arbitrary edge of E'
- 5 $C = C \cup \{u, v\}$
- 6 remove from E' every edge incident on either u or v
- 7 **return** C

An Approximation Algorithm based on Greedy

APPROX-VERTEX-COVER(G)

- 1 $C = \emptyset$
- 2 $E' = G.E$
- 3 **while** $E' \neq \emptyset$
- 4 let (u, v) be an arbitrary edge of E'
- 5 $C = C \cup \{u, v\}$
- 6 remove from E' every edge incident on either u or v
- 7 **return** C

An Approximation Algorithm based on Greedy

APPROX-VERTEX-COVER(G)

- 1 $C = \emptyset$
- 2 $E' = G.E$
- 3 **while** $E' \neq \emptyset$
- 4 let (u, v) be an arbitrary edge of E'
- 5 $C = C \cup \{u, v\}$
- 6 remove from E' every edge incident on either u or v
- 7 **return** C

An Approximation Algorithm based on Greedy

APPROX-VERTEX-COVER(G)

- 1 $C = \emptyset$
- 2 $E' = G.E$
- 3 **while** $E' \neq \emptyset$
- 4 let (u, v) be an arbitrary edge of E'
- 5 $C = C \cup \{u, v\}$
- 6 remove from E' every edge incident on either u or v
- 7 **return** C

APPROX-VERTEX-COVER produces a set of size 6.

An Approximation Algorithm based on Greedy

APPROX-VERTEX-COVER(G)

- 1 $C = \emptyset$
- 2 $E' = G.E$
- 3 **while** $E' \neq \emptyset$
- 4 let (u, v) be an arbitrary edge of E'
- 5 $C = C \cup \{u, v\}$
- 6 remove from E' every edge incident on either u or v
- 7 **return** C

The optimal solution has size 3.

Analysis of Greedy for Vertex Cover

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

Analysis of Greedy for Vertex Cover

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

Theorem 35.1

APPROX-VERTEX-COVER is a poly-time 2-approximation algorithm.

Analysis of Greedy for Vertex Cover

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

Theorem 35.1

APPROX-VERTEX-COVER is a poly-time 2-approximation algorithm.

Proof:

Analysis of Greedy for Vertex Cover

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

Theorem 35.1

APPROX-VERTEX-COVER is a poly-time 2-approximation algorithm.

Proof:

- Running time is $O(V + E)$ (using adjacency lists to represent E')

Analysis of Greedy for Vertex Cover

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

Theorem 35.1

APPROX-VERTEX-COVER is a poly-time 2-approximation algorithm.

Proof:

- Running time is $O(V + E)$ (using adjacency lists to represent E')
- Let $A \subseteq E$ denote the set of edges picked in line 4

Analysis of Greedy for Vertex Cover

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

Theorem 35.1

APPROX-VERTEX-COVER is a poly-time 2-approximation algorithm.

Proof:

- Running time is $O(V + E)$ (using adjacency lists to represent E')
- Let $A \subseteq E$ denote the set of edges picked in line 4
- **Key Observation:** A is a set of vertex-disjoint edges, i.e., A is a matching

Analysis of Greedy for Vertex Cover

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

Theorem 35.1

APPROX-VERTEX-COVER is a poly-time 2-approximation algorithm.

Proof:

- Running time is $O(V + E)$ (using adjacency lists to represent E')
 - Let $A \subseteq E$ denote the set of edges picked in line 4
 - **Key Observation:** A is a set of vertex-disjoint edges, i.e., A is a matching
- ⇒ Every optimal cover C^* must include at least one endpoint:

Analysis of Greedy for Vertex Cover

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

Theorem 35.1

APPROX-VERTEX-COVER is a poly-time 2-approximation algorithm.

Proof:

- Running time is $O(V + E)$ (using adjacency lists to represent E')
 - Let $A \subseteq E$ denote the set of edges picked in line 4
 - **Key Observation:** A is a set of vertex-disjoint edges, i.e., A is a matching
- ⇒ Every optimal cover C^* must include at least one endpoint: $|C^*| \geq |A|$

Analysis of Greedy for Vertex Cover

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

Theorem 35.1

APPROX-VERTEX-COVER is a poly-time 2-approximation algorithm.

Proof:

- Running time is $O(V + E)$ (using adjacency lists to represent E')
 - Let $A \subseteq E$ denote the set of edges picked in line 4
 - Key Observation:** A is a set of vertex-disjoint edges, i.e., A is a matching
- ⇒ Every optimal cover C^* must include at least one endpoint: $|C^*| \geq |A|$
- Every edge in A contributes 2 vertices to $|C|$:

Analysis of Greedy for Vertex Cover

APPROX-VERTEX-COVER(G)

```
1  $C = \emptyset$ 
2  $E' = G.E$ 
3 while  $E' \neq \emptyset$ 
4     let  $(u, v)$  be an arbitrary edge of  $E'$ 
5      $C = C \cup \{u, v\}$ 
6     remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

Theorem 35.1

3 while  $E' \neq \emptyset$ 
4   let  $(u, v)$  be an arbitrary edge of  $E'$ 
5    $C = C \cup \{u, v\}$ 
6   remove from  $E'$  every edge incident on either  $u$  or  $v$ 
7 return  $C$ 
```

A "vertex-based" Greedy that adds **one** vertex at each iteration fails to achieve an approximation ratio of 2 (Supervision Exercise)!

We can bound the size of the returned solution **without knowing** the (size of an) optimal solution!

Theorem 35.1

APPROX-VERTEX-COVER is a poly-time 2-approximation algorithm.

Proof:

- Running time is $O(V + E)$ (using adjacency lists to represent E')
 - Let $A \subseteq E$ denote the set of edges picked in line 4
 - **Key Observation:** A is a set of vertex-disjoint edges, i.e., A is a **matching**
- ⇒ Every optimal cover C^* must include at least one endpoint: $|C^*| \geq |A|$
- Every edge in A contributes 2 vertices to $|C|$: $|C| = 2|A| \leq 2|C^*|$. \square

Solving Special Cases

Strategies to cope with NP-complete problems

1. If inputs are small, an algorithm with exponential running time may be satisfactory.
2. Isolate important special cases which can be solved in polynomial-time.
3. Develop algorithms which find near-optimal solutions in polynomial-time.

Vertex Cover on Trees

Vertex Cover on Trees

There exists an optimal vertex cover which does not include any leaves.

Vertex Cover on Trees

There exists an **optimal vertex cover** which does not include any **leaves**.

Exchange-Argument: Replace any leaf in the cover by its parent.

Vertex Cover on Trees

There exists an **optimal vertex cover** which does not include any **leaves**.

Exchange-Argument: Replace any leaf in the cover by its parent.

Vertex Cover on Trees

There exists an **optimal vertex cover** which does not include any **leaves**.

Exchange-Argument: Replace any leaf in the cover by its parent.

Vertex Cover on Trees

There exists an **optimal vertex cover** which does not include any **leaves**.

Exchange-Argument: Replace any leaf in the cover by its parent.

Solving Vertex Cover on Trees

There exists an **optimal vertex cover** which does not include any **leaves**.

There exists an optimal vertex cover which does not include any leaves.

VERTEX-COVER-TREES(G)

- 1: $C = \emptyset$
- 2: **while** \exists leaves in G
- 3: Add all parents to C
- 4: Remove all leaves and their parents from G
- 5: **return** C

Solving Vertex Cover on Trees

There exists an **optimal vertex cover** which does not include any **leaves**.

VERTEX-COVER-TREES(G)

- 1: $C = \emptyset$
- 2: **while** \exists leaves in G
- 3: Add all parents to C
- 4: Remove all leaves and their parents from G
- 5: **return** C

Clear: **Running time** is $O(V)$, and the returned solution is a **vertex cover**.

Solving Vertex Cover on Trees

There exists an **optimal vertex cover** which does not include any **leaves**.

VERTEX-COVER-TREES(G)

- 1: $C = \emptyset$
- 2: **while** \exists leaves in G
- 3: Add all parents to C
- 4: Remove all leaves and their parents from G
- 5: **return** C

Clear: **Running time** is $O(V)$, and the returned solution is a **vertex cover**.

Solution is also **optimal**. (Use inductively the existence of an optimal vertex cover without leaves)

Execution on a Small Example

VERTEX-COVER-TREES(G)

- 1: $C = \emptyset$
- 2: **while** \exists leaves in G
- 3: Add all parents to C
- 4: Remove all leaves and their parents from G
- 5: **return** C

Execution on a Small Example

Simple **Brute-Force Search** would take $\approx \binom{n}{k} = \Theta(n^k)$ time.

Towards a more efficient Search

Substructure Lemma

Consider a graph $G = (V, E)$, edge $\{u, v\} \in E(G)$ and integer $k \geq 1$. Let G_u be the graph obtained by deleting u and its incident edges (G_v is defined similarly). Then G has a vertex cover of size k if and only if G_u or G_v (or both) have a vertex cover of size $k - 1$.

Towards a more efficient Search

The Set-Covering Problem

Set Cover Problem

- Given: set X of size n and family of subsets \mathcal{F}
- Goal: Find a minimum-size subset $\mathcal{C} \subseteq \mathcal{F}$

Number of sets
(and not elements)

$$\text{s.t. } X = \bigcup_{S \in \mathcal{C}} S.$$

Only solvable if $\bigcup_{S \in \mathcal{F}} S = X!$

Remarks:

The Set-Covering Problem

Set Cover Problem

- Given: set X of size n and family of subsets \mathcal{F}
- Goal: Find a minimum-size subset $\mathcal{C} \subseteq \mathcal{F}$

Number of sets
(and not elements)

$$\text{s.t. } X = \bigcup_{S \in \mathcal{C}} S.$$

Only solvable if $\bigcup_{S \in \mathcal{F}} S = X!$

Remarks:

- generalisation of the vertex-cover problem and hence also NP-hard.

The Set-Covering Problem

Set Cover Problem

- Given: set X of size n and family of subsets \mathcal{F}
- Goal: Find a minimum-size subset $\mathcal{C} \subseteq \mathcal{F}$

Number of sets
(and not elements)

$$\text{s.t. } X = \bigcup_{S \in \mathcal{C}} S.$$

Only solvable if $\bigcup_{S \in \mathcal{F}} S = X!$

Remarks:

- generalisation of the vertex-cover problem and hence also NP-hard.
- models resource allocation problems, e.g., wireless coverage

Greedy

Strategy: Pick the set S that covers the largest number of uncovered elements.

Greedy

Strategy: Pick the set S that covers the largest number of uncovered elements.

5      $U = U - S$ 
6      $\mathcal{C} = \mathcal{C} \cup \{S\}$ 
7 return  $\mathcal{C}$ 
```

Greedy

Strategy: Pick the set S that covers the largest number of uncovered elements.

GREEDY-SET-COVER(X, \mathcal{F})

```
1  $U = X$ 
2  $\mathcal{C} = \emptyset$ 
3 while  $U \neq \emptyset$ 
4     select an  $S \in \mathcal{F}$  that maximizes  $|S \cap U|$ 
5      $U = U - S$ 
6      $\mathcal{C} = \mathcal{C} \cup \{S\}$ 
7 return  $\mathcal{C}$ 
```

Greedy chooses S_1, S_4, S_5 and S_3 (or S_6), which is a cover of size 4.

Greedy

Strategy: Pick the set S that covers the largest number of uncovered elements.

GREEDY-SET-COVER(X, \mathcal{F})

```
1  $U = X$ 
2  $\mathcal{C} = \emptyset$ 
3 while  $U \neq \emptyset$ 
4     select an  $S \in \mathcal{F}$  that maximizes  $|S \cap U|$ 
5      $U = U - S$ 
6      $\mathcal{C} = \mathcal{C} \cup \{S\}$ 
7 return  $\mathcal{C}$ 
```

Greedy chooses S_1, S_4, S_5 and S_3 (or S_6), which is a cover of size 4.

Optimal cover is $\mathcal{C} = \{S_3, S_4, S_5\}$

Greedy

Strategy: Pick the set S that covers the largest number of uncovered elements.

GREEDY-SET-COVER(X, \mathcal{F})

```
1  $U = X$ 
2  $\mathcal{C} = \emptyset$ 
3 while  $U \neq \emptyset$ 
4     select an  $S \in \mathcal{F}$  that maximizes  $|S \cap U|$ 
5      $U = U - S$ 
6      $\mathcal{C} = \mathcal{C} \cup \{S\}$ 
7 return  $\mathcal{C}$ 
```

Can be easily implemented to run in time polynomial in $|X|$ and $|\mathcal{F}|$

Greedy

Strategy: Pick the set S that covers the largest number of uncovered elements.

GREEDY-SET-COVER(X, \mathcal{F})

```
1  $U = X$ 
2  $\mathcal{C} = \emptyset$ 
3 while  $U \neq \emptyset$ 
4     select an  $S \in \mathcal{F}$  that maximizes  $|S \cap U|$ 
5      $U = U - S$

```

Can be easily implemented to run in time polynomial in $|X|$ and $|\mathcal{F}|$

How good is the approximation ratio?

Approximation Ratio of Greedy

Theorem 35.4

GREEDY-SET-COVER is a polynomial-time $\rho(n)$ -algorithm, where

$$\rho(n) = H(\max\{|S| : S \in \mathcal{F}\})$$

Approximation Ratio of Greedy

Theorem 35.4

GREEDY-SET-COVER is a polynomial-time $\rho(n)$ -algorithm, where

$$\rho(n) = H(\max\{|S| : S \in \mathcal{F}\})$$

$$H(k) := \sum_{i=1}^k \frac{1}{i} \leq \ln(k) + 1$$

Approximation Ratio of Greedy

Theorem 35.4

GREEDY-SET-COVER is a polynomial-time $\rho(n)$ -algorithm, where

$$\rho(n) = H(\max\{|S| : S \in \mathcal{F}\}) \leq \ln(n) + 1.$$

$$H(k) := \sum_{i=1}^k \frac{1}{i} \leq \ln(k) + 1$$

Approximation Ratio of Greedy

Theorem 35.4

GREEDY-SET-COVER is a polynomial-time $\rho(n)$ -algorithm, where

$$\rho(n) = H(\max\{|S| : S \in \mathcal{F}\}) \leq \ln(n) + 1.$$

$$H(k) := \sum_{i=1}^k \frac{1}{i} \leq \ln(k) + 1$$

Idea: Distribute cost of 1 for each added set over newly covered elements.

Approximation Ratio of Greedy

Theorem 35.4

GREEDY-SET-COVER is a polynomial-time $\rho(n)$ -algorithm, where

$$\rho(n) = H(\max\{|S| : S \in \mathcal{F}\}) \leq \ln(n) + 1.$$

$$H(k) := \sum_{i=1}^k \frac{1}{i} \leq \ln(k) + 1$$

Idea: Distribute cost of 1 for each added set over newly covered elements.

Definition of cost

If an element x is covered for the first time by set S_i in iteration i , then

$$c_x := \frac{1}{|S_i \setminus (S_1 \cup S_2 \cup \dots \cup S_{i-1})|}.$$

Approximation Ratio of Greedy

Theorem 35.4

GREEDY-SET-COVER is a polynomial-time $\rho(n)$ -algorithm, where

$$\rho(n) = H(\max\{|S| : S \in \mathcal{F}\}) \leq \ln(n) + 1.$$

$$H(k) := \sum_{i=1}^k \frac{1}{i} \leq \ln(k) + 1$$

Idea: Distribute cost of 1 for each added set over newly covered elements.

Definition of cost

If an element x is covered for the first time by set S_i in iteration i , then

$$c_x := \frac{1}{|S_i \setminus (S_1 \cup S_2 \cup \dots \cup S_{i-1})|}.$$

Notice that in the mathematical analysis, S_i is the set chosen in iteration i - not to be confused with the sets S_1, S_2, \dots, S_6 in the example.

$$|S_i \setminus (S_1 \cup S_2 \cup \dots \cup S_{i-1})| \geq |S \setminus (S_1 \cup S_2 \cup \dots \cup S_{i-1})| = u_{i-1}.$$

- Combining the last inequalities gives:

$$\begin{aligned} \sum_{x \in S} c_x &\leq \sum_{i=1}^k (u_{i-1} - u_i) \cdot \frac{1}{u_{i-1}} = \sum_{i=1}^k \sum_{j=u_i+1}^{u_{i-1}} \frac{1}{u_{i-1}} \\ &\leq \sum_{i=1}^k \sum_{j=u_i+1}^{u_{i-1}} \frac{1}{j} \\ &= \sum_{i=1}^k (H(u_{i-1}) - H(u_i)) \end{aligned}$$

Proof of Theorem 35.4 (2/2)

Proof of the Key Inequality $\sum_{x \in S} c_x \leq H(|S|)$

- For any $S \in \mathcal{F}$ and $i = 1, 2, \dots, |C| = k$ let $u_i := |S \setminus (S_1 \cup S_2 \cup \dots \cup S_i)|$
- $\Rightarrow |S| = u_0 \geq u_1 \geq \dots \geq u_{|C|} = 0$ and $u_{i-1} - u_i$ counts the items in S covered first time by S_i .

\Rightarrow

$$\sum_{x \in S} c_x = \sum_{i=1}^k (u_{i-1} - u_i) \cdot \frac{1}{|S_i \setminus (S_1 \cup S_2 \cup \dots \cup S_{i-1})|}$$

- Further, by definition of the **GREEDY-SET-COVER**:

$$|S_i \setminus (S_1 \cup S_2 \cup \dots \cup S_{i-1})| \geq |S \setminus (S_1 \cup S_2 \cup \dots \cup S_{i-1})| = u_{i-1}.$$

- Combining the last inequalities gives:

$$\begin{aligned} \sum_{x \in S} c_x &\leq \sum_{i=1}^k (u_{i-1} - u_i) \cdot \frac{1}{u_{i-1}} = \sum_{i=1}^k \sum_{j=u_i+1}^{u_{i-1}} \frac{1}{u_{i-1}} \\ &\leq \sum_{i=1}^k \sum_{j=u_i+1}^{u_{i-1}} \frac{1}{j} \\ &= \sum_{i=1}^k (H(u_{i-1}) - H(u_i)) = H(u_0) - H(u_k) \end{aligned}$$

Proof of Theorem 35.4 (2/2)

Proof of the Key Inequality $\sum_{x \in S} c_x \leq H(|S|)$

- For any $S \in \mathcal{F}$ and $i = 1, 2, \dots, |C| = k$ let $u_i := |S \setminus (S_1 \cup S_2 \cup \dots \cup S_i)|$
- $\Rightarrow |S| = u_0 \geq u_1 \geq \dots \geq u_{|C|} = 0$ and $u_{i-1} - u_i$ counts the items in S covered first time by S_i .

\Rightarrow

$$\sum_{x \in S} c_x = \sum_{i=1}^k (u_{i-1} - u_i) \cdot \frac{1}{|S_i \setminus (S_1 \cup S_2 \cup \dots \cup S_{i-1})|}$$

- Further, by definition of the **GREEDY-SET-COVER**:

$$|S_i \setminus (S_1 \cup S_2 \cup \dots \cup S_{i-1})| \geq |S \setminus (S_1 \cup S_2 \cup \dots \cup S_{i-1})| = u_{i-1}.$$

- Combining the last inequalities gives:

$$\begin{aligned} \sum_{x \in S} c_x &\leq \sum_{i=1}^k (u_{i-1} - u_i) \cdot \frac{1}{u_{i-1}} = \sum_{i=1}^k \sum_{j=u_i+1}^{u_{i-1}} \frac{1}{u_{i-1}} \\ &\leq \sum_{i=1}^k \sum_{j=u_i+1}^{u_{i-1}} \frac{1}{j} \\ &= \sum_{i=1}^k (H(u_{i-1}) - H(u_i)) = H(u_0) - H(u_k) = H(|S|). \quad \square \end{aligned}$$

Set-Covering Problem (Summary)

Theorem 35.4

GREEDY-SET-COVER is a polynomial-time $\rho(n)$ -algorithm, where

$$\rho(n) = H(\max\{|S| : S \in \mathcal{F}\}) \leq \ln(n) + 1.$$

Set-Covering Problem (Summary)

The same approach also gives an approximation ratio of $O(\ln(n))$ if there exists a cost function $c : \mathcal{F} \rightarrow \mathbb{R}^+$

Theorem 35.4

GREEDY-SET-COVER is a polynomial-time $\rho(n)$ -algorithm, where

$$\rho(n) = H(\max\{|S| : S \in \mathcal{F}\}) \leq \ln(n) + 1.$$

Set-Covering Problem (Summary)

Theorem 35.4

GREEDY-SET-COVER is a polynomial-time $\rho(n)$ -algorithm, where

$$\rho(n) = H(\max\{|S| : S \in \mathcal{F}\}) \leq \ln(n) + 1.$$

- Is the bound on the approximation ratio in Theorem 35.4 **tight**?
- Is there a **better algorithm**?

Set-Covering Problem (Summary)

Theorem 35.4

GREEDY-SET-COVER is a polynomial-time $\rho(n)$ -algorithm, where

$$\rho(n) = H(\max\{|S| : S \in \mathcal{F}\}) \leq \ln(n) + 1.$$

- Is the bound on the approximation ratio in Theorem 35.4 **tight**?
- Is there a **better algorithm**?

Lower Bound

Unless $P=NP$, there is no $c \cdot \ln(n)$ polynomial-time approximation algorithm for some constant $0 < c < 1$.

Example where the solution of Greedy is bad

Instance

- Given any integer $k \geq 3$

Example where the solution of Greedy is bad

Instance

- Given any integer $k \geq 3$
- There are $n = 2^{k+1} - 2$ elements overall (so $k \approx \log_2 n$)

Optimum consists of 2 sets.

Exercise: Consider the vertex cover problem, restricted to a graph where every vertex has exactly 3 neighbours. Which approximation ratio can we obtain?

- 1 (i.e., I can solve it exactly!!!)
- 2
- $11/6 = 2 - 1/6$
- $H(n) \leq \log(n)$
