

Complexity Theory

Easter 2007

Suggested Exercises 3

1. Show that a language L is in **co** – **NP** if, and only if, there is a nondeterministic Turing machine M and a polynomial p such that M halts in time $p(n)$ for all inputs of length x , and L is exactly the set of strings x such that *all* computations of M on input x end in an accepting state.
2. Define a *strong* nondeterministic Turing machine as one where each computation has three possible outcomes: accept, reject or maybe. If M is such a machine, we say that it accepts L , if for every $x \in L$, every computation path of M on x ends in either accept or maybe, with at least one accept *and* for $x \notin L$, every computation path of M on x ends in reject or maybe, with at least one reject.

Show that if L is decided by a strong nondeterministic Turing machine running in polynomial time, then $L \in \mathbf{NP} \cap \mathbf{co-NP}$.

3. Consider the algorithm presented in the lecture which establishes that **Reachability** is in $\mathbf{SPACE}((\log n)^2)$. What is the time complexity of this algorithm?

Can you generalise the time bound to the entire complexity class? That is, give a class of functions F , such that

$$\mathbf{SPACE}((\log n)^2) \subseteq \bigcup_{f \in F} \mathbf{TIME}(f)$$

4. Show that, for every nondeterministic machine M which uses $O(\log n)$ work space, there is a machine R with three tapes (**input**, **work** and **output**) which works as follows. On input x , R produces on its output tape a description of the configuration graph for M , x , and R uses $O(\log |x|)$ space on its work tape.

Explain why this means that if **Reachability** is in **L**, then **L** = **NL**.

5. Consider the language L in the alphabet $\{a, b\}$ given by $L = \{a^n b^n \mid n \in \mathbb{N}\}$. $L \notin \mathbf{SPACE}(c)$ for any constant c . Why?
