1 Distributed Systems

Describe one of the following architectures for supporting distributed programming:

Either  
Remote Procedure Call  
or  
Object Request Brokerage  
[11 marks]

Many emerging applications require timely response to events. Discuss the following approaches to achieving this:

(a) polling  
[3 marks]

(b) synchronous call back  
[3 marks]

(c) asynchronous notification  
[3 marks]
2 Computer Design

What is the difference between serial and parallel data transmission? [4 marks]

RS232 is a serial communications protocol. Explain how the letter “A” (ASCII code 65 in decimal) is transmitted if one start bit and one stop bit are to be used. [5 marks]

Parallel data transmission is typically used to communicate with main memory (DRAM). Explain the principal operations involved in reading a burst of consecutive data words from DRAM. [6 marks]

What is a cache and why would it typically wish to read a block of data rather than a single word from the DRAM? [5 marks]

3 Digital Communication I

What is a hierarchical address space? Give an example of an address space which is hierarchical and one which is not. [3 marks]

What is the Address Resolution Protocol? Describe its operation when used to resolve IP addresses to Ethernet addresses. Pay particular attention to the freshness of information. [7 marks]

Information is transferred via a long, error-prone communication link. The link has a data rate of 10 Mbps and a constant delay. The bit error rate on the link is 1 bit in $10^4$. A forward error correcting coder is available which can act in the following settings:

<table>
<thead>
<tr>
<th>Data rate</th>
<th>Error rate</th>
<th>Code rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Mbps</td>
<td>$10^{-4}$</td>
<td>unity (no coding)</td>
</tr>
<tr>
<td>5 Mbps</td>
<td>$10^{-5}$</td>
<td>half</td>
</tr>
</tbody>
</table>

A simple ARQ protocol is used over the link. Packets have 32-bit CRCs. You may assume that the undetected error rate is less than 1 in $10^{20}$, that is, effectively zero.

Information is sent in 1000-bit packets, with a window of one packet. At what link delay would it be beneficial to use the FEC coder? [10 marks]
4 Computer Graphics and Image Processing

You have a cone of height one unit; apex at the origin; and base of diameter one unit centred on the negative z-axis.

You wish to transform this cone so that the apex is at (−1, 3, 7), the base is centred at (2, 7, −5), and the base’s radius is four units. What transformations are required to achieve this and in what order should they be performed? [8 marks]

Describe an algorithm which clips an arbitrary polygon against an arbitrary convex polygon (in 2D). [8 marks]

Will your algorithm correctly clip an arbitrary polygon against an arbitrary non-convex polygon? If so, explain why and demonstrate an example which illustrates that it does work in such cases. If not, explain why not and outline how your algorithm could be extended to perform clipping in such cases. [4 marks]

5 Business Studies

Describe five criteria a Venture Capitalist might use for assessing a business. [5 marks]

Write, in terms of these criteria, an assessment of the Apple iMac project. [3 marks for each criterion]

6 Comparative Programming Languages

Early programming languages had relatively poor facilities for type checking, data abstraction, data hiding and encapsulation. Explain the meaning of these terms and discuss their importance. [6 marks]

Outline the key features that a language must have to be called object-oriented and briefly discuss to what extent C++, Java and Smalltalk have them. [7 marks]

Briefly discuss some of the reasons why C++ programs typically run faster than equivalent programs written in Java or Smalltalk. [7 marks]
7 Compiler Construction

It is desired to obtain an unambiguous context-free grammar $G'$ which generates the same strings as the following grammar $G$ with start symbol $S$.

$S \rightarrow E$
$E \rightarrow (E) \mid [E] \mid E \ast E \mid a \mid b \mid c$
$(E) \rightarrow (+E)$
$[E] \rightarrow (-E)$

Define a suitable $G'$ or explain why $G$ already satisfies the criterion. [6 marks]

Write a context-free (Type 2) grammar which describes floating-point numbers of the form $[\pm]dd^*.[d^*][e] \pm dd^*$ where $d$ stands for decimal digit and $d^*$ stands for zero or more decimal digits. $[\cdots]$ means that the enclosed item is optionally present in the floating-point number. [7 marks]

Sketch a recursive descent parser for the following grammar $H$ with start symbol $S$. You should assume the existence of a routine $\text{lex()}$ which sets variable $\text{token}$ to one of '1', '2', '(', ')', '-' or $\text{eof}$.

$P \rightarrow 1 \mid 2 \mid (E)$
$E \rightarrow P \mid E - P$
$S \rightarrow E \text{ eof}$

[7 marks]

8 Prolog for Artificial Intelligence

A trinary tree is constructed from 3-ary compound terms $n(a, b, c)$ called nodes, where components $a$, $b$ and $c$ are either nodes or integers. Assume that integer components are restricted to the values 0 and 1.

Write a Prolog program to return a list of all the 0’s and a list of all the 1’s in a given tree. For example, the goal $\text{enum}(n(n(0, 1, 0), 1, 0), X, Y)$ should instantiate $X$ to $[0, 0, 0]$ and $Y$ to $[1, 1]$. The program should use difference lists. [10 marks]

A terminal node of the trinary tree is said to be of odd parity if the number of its 1 components is an odd number. For example, $n(1, 1, 1)$ is of odd parity, and $n(1, 0, 1)$ is not of odd parity. Write a Prolog program to count the number of terminal nodes in a tree that have odd parity. For example, the goal $\text{odd}(n(n(0, 1, 0), 1, 0), X)$ should instantiate $X$ to 1. [10 marks]
9 Databases

Give *three* ways in which an Object Data Model can extend the semantics offered by the 1992 SQL Standard. [5 marks]

Compare and contrast the facilities of the ODMG Database Standard and of the proposed SQL3 standard for representing the data and behaviour of objects. Illustrate your answer by considering the employee records of a transport business. [12 marks]

What drawbacks might be associated with the use of an OODB for this data? [3 marks]
10 Introduction to Functional Programming

Define the higher order function $\text{foldl}$ ("fold left") such that

$$\text{foldl} \ (\text{op}+) \ (0,[1,2,3]) \ \text{evaluates to} \ 6, \ \text{and}$$
$$\text{foldl} \ (\text{op}^) \ (\text{"doh"},[\text{"ray"},\text{"me"}]) \ \text{evaluates to} \ \text{"dohrayme"}$$

(Recall that $\text{^}$ is a function to concatenate two strings.) \[3 \text{ marks}\]

Define the higher order function $\text{foldr}$ ("fold right") such that

$$\text{foldr} \ (\text{op}+) \ (0,[1,2,3]) \ \text{evaluates to} \ 6, \ \text{and}$$
$$\text{foldr} \ (\text{op}^) \ (\text{"doh"},[\text{"ray"},\text{"me"}]) \ \text{evaluates to} \ \text{"raymedoh"}$$

\[3 \text{ marks}\]

Use either $\text{foldl}$ or $\text{foldr}$ to write the following functions.

(a) The function $\text{append}$, such that the expression

$$\text{append}([1,2],[3,4])$$

evaluates to $[1,2,3,4]$. \[2 \text{ marks}\]

(b) The function $\text{length}$, such that the expression

$$\text{length}([1,6,9,15])$$

evaluates to 4. \[4 \text{ marks}\]

(c) The function $\text{map}$, such that the expression

$$\text{map} \ (\text{fn} \ x \ => \ x+1) \ [1,2,3]$$

evaluates to $[2,3,4]$. \[4 \text{ marks}\]

In some cases, $\text{foldl}$ and $\text{foldr}$ can be interchanged, i.e. the theorem

$$\text{foldl} \ f \ (e,\text{xs}) = \ \text{foldr} \ f \ (e,\text{xs})$$

holds. Assuming that the list $\text{xs}$ is finite, give two conditions concerning $f$ and $e$ that are sufficient for this theorem to be true. [Hint: you may find it helpful to consider the expansion of the expressions $\text{foldl} \ (\text{op}+) \ (0,[1,2,3])$ and $\text{foldr} \ (\text{op}+) \ (0,[1,2,3])$.] \[4 \text{ marks}\]
11 Computer Vision

Contrast the use of linear versus non-linear operators in computer vision, giving at least one example of each. What can linear operators accomplish, and what are their fundamental limitations? With non-linear operators, what heavy price must be paid and what are the potential benefits? [8 marks]

When shape descriptors such as “codons” or Fourier boundary descriptors are used to encode the closed 2D shape of an object in an image, how can invariances for size, position, and orientation be achieved? Why are these goals important for pattern recognition and classification? [6 marks]

Define the general form of “superquadrics” used as volumetric primitives for describing 3D objects. What are their strengths and their limitations? [6 marks]

12 Complexity Theory

Explain what is meant by a deterministic and a non-deterministic Turing Machine and the idea of such machines solving a decision problem. [7 marks]

If a non-deterministic Turing Machine solves a certain problem in at most $N$ time-steps, what information must be noted to document the exact state of the machine at each stage as it performs the calculation? [5 marks]

Part of the information you have just identified will be the sequence of states $q_0, q_1, \ldots$ that the machine goes through. Taking account of the fact that the machine is non-deterministic show how

(a) this part of the information can be represented by the values of a number of boolean variables, and

(b) a formula in the style used in the problem 3-SAT can be written down to ensure that the sequence of states is one that does correspond to a valid computation of the machine.

[Marks will be deducted if you attempt to document how to extend your demonstration to cover other aspects of the machine’s behaviour.] [8 marks]
13 Numerical Analysis II

With reference to solution of the differential equation $y' = f(x, y)$, explain the conventional notation $x_n$, $y(x_n)$, $y_n$, and $f_n$. [3 marks]

Explain the terms local error, global error, and order of a method. [3 marks]

Milne’s method uses the multistep formulae

$$y_{n+1} = y_{n-3} + \frac{4h}{3}(2f_n - f_{n-1} + 2f_{n-2})$$

$$y_{n+1} = y_{n-1} + \frac{h}{3}(\tilde{f}_{n+1} + 4f_n + f_{n-1})$$

which each have local error $O(h^5)$. Outline the general technique for deriving multistep formulae. What is the meaning of the term $\tilde{f}_{n+1}$? Suggest a suitable starting procedure and explain how the Milne formulae are used. [8 marks]

Let $y(x_0) = 0, h = 0.3$ and $f(x, y) = 3y/x - 2$. Suppose the following values of $f_n$ have been generated by the starting procedure: 1.3, 2.1, 3.4 for $n = 1, 2, 3$. Calculate the first required value of $\tilde{f}_{n+1}$. [3 marks]

Contrast Milne’s method with a comparable one step method, commenting particularly on stability, efficiency and step size considerations. [3 marks]
