## COMPUTER SCIENCE TRIPOS Part IB - 2021 - Paper 6

## 9 Logic and Proof (lp15)

(a) Suppose we have the propositional symbols $P_{1}, P_{2}, \ldots, P_{n}$, where $n>2$, and consider the set of clauses

$$
\left\{\neg P_{1}, P_{2}\right\} \quad\left\{\neg P_{2}, P_{3}\right\} \quad \cdots \quad\left\{\neg P_{n}, P_{1}\right\} .
$$

(i) List the satisfying interpretations (if any) of this set of clauses, with brief justification.
(ii) Regarding the set of clauses above as a single propositional formula, and using the variable ordering $P_{1}, P_{2}, \ldots, P_{n}$, sketch the corresponding BDD. Does the choice of variable ordering here significantly affect the size of the resulting BDD?
(iii) Briefly describe the set of clauses that would be generated by a resolution theorem prover, starting with the set of clauses above.
(b) For the following set of clauses, either exhibit a model, or show that none exists using resolution. Below, $a$ and $b$ are constants, while $y$ and $z$ are variables.

$$
\begin{gathered}
\{P(a, f(a)), P(a, b)\} \\
\{P(a, f(a)), \neg P(z, b), P(z, f(a))\} \\
\{\neg P(a, f(a)), P(g(y), y), \neg P(a, y)\} \\
\{\neg P(a, f(a)), \neg P(g(y), f(a)), \neg P(a, y)\}
\end{gathered}
$$
