We meet, we connect, we communicate

- We *meet* in real life in the real world
- We use text *messages*, phones, IM
- We make *friends* on facebook, Second Life
- How are these **related**?
- How do they **affect** each other?
- How do they **change** with new technology?

I have 100M bytes of data, who can carry for me?

Don't give to me! I am running out of storage.

Give it to me, I have 1G bytes phone flash.

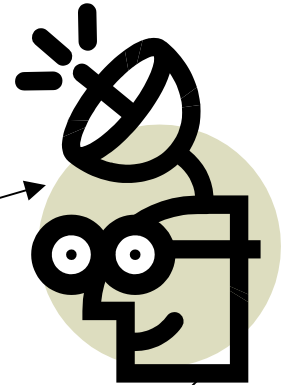

Thank you but you are in the opposite direction!

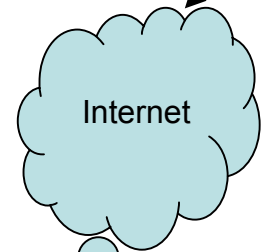

I can also carry for you!

Reach an access point.

Internet

Finally, it arrive...

There is one in my pocket...

Social Networks Online and in Real Life

Cliques and Communities

Dunbar's Number & Trust

- Dunbar's number:-150 (for humans)
 - Size of simple communities of humans
 - Reflects ability to cope with group
 - Humans gossip rather than physical grooming
 - Language lets us abstract
 - We can reason up to 5 levels of intentionality
 - (Shakespeare does 6 :-)
- $T = 1 / [3.x^N]$
 - T is trust metric
 - 3.x is a number between 3 and 4
 - N is distance in social net

Conjecture on N?

- $N = 0 = \text{Kin (sex)}$
- $N = 1 = \text{friends (beer/drugs)}$
- $N = 2 \text{ or more} = \text{acquaintances}$
(dancing/music/laughing at same jokes)
- How does this help in facebook?

Conjecture on Online v. Real

- We're looking at co-lo networks
 - c.f. hagggle, cityware - bluetooth etc
- AND online social networks
 - Friendship graph on orkut, li, facebook
- AND communication networks
 - Email address book, sms, phonecalls
- Can use to infer real relationship
 - I.e. type of edge in graph (and value of N)

Conjectures on Trust

- Trust in terms of revelation/disclosure
 - Or carrying data (in ferry net)
 - Or simple automated/default grouping for ACLs
- Need to do some experiments
 - Figure out how ties are broken
 - Forgetting
 - How new tools/technology affect
 - Size and dynamics of social net...

EU Social Net Project Questions

- What net/edge type is more likely to cause an edge in another net?
 - Does meeting someone dominate over online or vice versa -
 - i.e. how does new tech affect x (size of immediate gang) and
 - N (scope of gang/level of intentionality reasoning?)?
 - Can you use this to detect dodgy behaviour (spam, bullying, etc)?

Ongoing studies

- Data?
 - We have large datasets for single edge-type/modality
 - (6M phone call timeloc, 1M social net)
 - But only very small datasets for 2 or 3 modalities
 - 30 army base people -> retirement
 - 100 school leavers -> University
 - Very heavy-lifting
 - Not only lots of data processing, but worse:-
 - Interview each user for context
- Privacy?
 - Correlating (datamining) the different nets is massive breach of trust
- Usefulness?

Usefulness?

1. Improve privacy
 1. As mentioned, could auto-default Fb settings and relate to phone/locn
 2. Could also use as interest based filter
2. Fundamental understanding of social groups
 1. How society/technology co-evolve
 2. Social inclusion and accessibility (!)
3. Epidemiology (*)
4. Buzztraq
 1. Use currency of local interest to
 2. Fetch content...

Epidemiology

- Two projects -
 - Emulation (ESRC)
 - Run s/w on smart phone that mimics a disease
 - Has a “vector” and SIR(!) parameter per person
 - Run on “real society” based on meeting duration/proximity/frequency
- Flubook (Horizon)
 - Panic button (“Not well”/”Feelin better”)
 - Uploads list of contacts in last week via free SMS
 - Puts anonymized data on google maps
 - Alerts trusted friendship group on fb

SIR

- Susceptibility, Infectiousness, Recovery
 - Given contact distribution,
 - Can compute progress of epidemic
 - Whether collapse (S, I low, R high)
 - Or go pandemic (S, I high)
 - As with relationship between online and RL behaviour for socialising,
 - Flubook might alter contact rate...
 -systematically for subset of population
 - ...(social or geographic) with high S/I
 - Help prevent/collapse epidemic

Thank you...

- Questions? ...

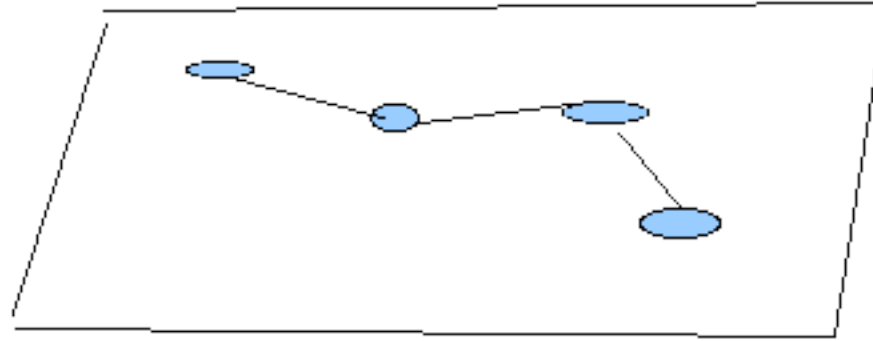

And another thing

- Virtualising online social self
 - Floating it in the “cloud”
 - Crypt content, but allow cloud/fb to match interests (for advertising)
- Migrate it to track user (and handset)
- Performance gain
 - handset can be meagre cpu/memory
 - Latency reduced
 - Synchronisation/persistence assured
 - Don't care if handset lost/stolen :-)

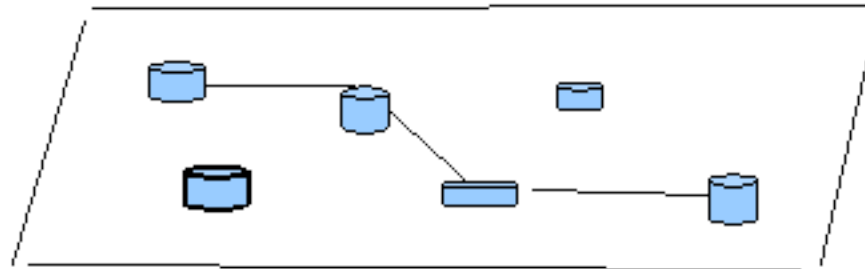

Snakes (and Ladders) on a Plane

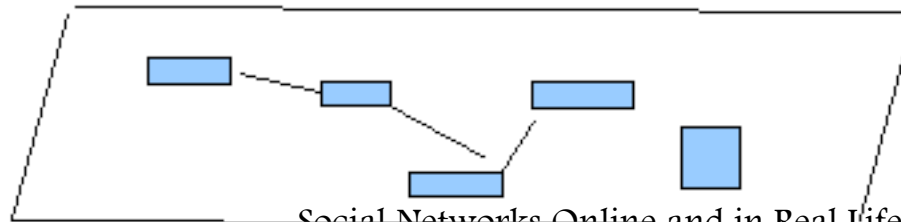

- Human

- Node

- World

Threads of your life

- Human level is activities & relationships
- Nodal level is processing and storage
- World level is location and context

Idea is...

- To allow mobile (compact/portable) representation of your activities and relationships (Owned by you)
- Roam across arbitrary nodes in environment (embedded or handset owned by anyone)
- While recording where you are and context (= other people)
