# How to Have a Bad Career in Research/Academia

**Professor David A. Patterson** 

November 2001

www.cs.berkeley.edu/~pattrsn/talks/BadCareer.pdf

#### Outline

- Part I: Key Advice for a Bad Career while a Grad Student
- Part II: Key Advice on Alternatives to a Bad Graduate Career
- Part III: Key Advice for a Bad Career, Post Ph.D.
- Part IV: Key Advice on Alternatives to a Bad Career, Post Ph.D.
- . Topics covered in Parts III and IV
  - Selecting a Problem
  - Picking a Solution
  - Performing the Research
  - Evaluating the Results
  - Communicating Results
  - Transferring Technology

#### Part I: How to Have a Bad Graduate Career

- Concentrate on getting good grades:
  - postpone research involvement: might lower GPA
- . Minimize number and flavors of courses
  - Why take advantage of 1 of the top departments with an emphasis on excellent grad courses?
  - Why take advantage of a campus with 35/36 courses in the top 10?
  - May affect GPA
- Don't trust your advisor
  - Advisor is only interested in his or her own career, not yours
  - Advisor may try to mentor you, use up time, interfering with GPA
- Only work the number of hours per week you are paid!
  - Don't let master class exploit the workers!

DAP Nov. '01 @UCB 3

#### Part I: How to Have a Bad Graduate Career

- Concentrate on graduating as fast as possible
  - Winner is first in class to Ph.D.
  - People only care about that you have a Ph.D. and your GPA, not on what you know
    - » Nirvana: graduating in 3.5 years with a 4.0 GPA!
  - Don't spend a summer in industry: takes longer
    - » How could industry experience help with selecting Ph.D. topic?
  - Don't work on large projects: takes longer
    - » Have to talk to others, have to learn different areas
    - » Synchronization overhead of multiple people
  - Don't do a systems Ph.D.: takes longer
- · Don't go to conferences
  - It costs money and takes time; you'll have plenty of time to learn the field after graduating
- Don't waste time polishing writing or talks
  - Again, that takes time

#### Part II: Alternatives to a Bad Graduate Career

- Concentrate on getting good grades?
  - Reality: need to maintain reasonable grades
    - » Only once gave a below B in CS 252
    - » 3 prelim courses only real grades that count
  - What matters on graduation is letters of recommendation from 3-4 faculty/Ph.D.s who have known you for 5+ years
- . Minimize number and flavors of courses?
  - Your last chance to be exposed to new ideas before have to learn them on your own (re: queueing theory and me)
  - Get a real outside minor from a campus with great departments in all fields; e.g., Management of Technology certificate, Copyright Law
- · Don't trust your advisor?
  - Primary attraction of campus vs. research lab is getting to work with grad students
  - Faculty career is judged in large part by success of his or her students
  - try taking advice of advisor?

DAP Nov. '01 @UCB 5

#### Part II: Alternatives to a Bad Graduate Career

- Concentrate on graduating as fast as possible?
  - Your last chance to learn; most learning will be outside the classroom
  - Considered newly "minted" when finish Ph.D.
    - » Judged on year of Ph.D. vs. year of birth
    - » To a person in their 40s or 50s,
    - 1 or 2 more years is roundoff error (27 = 29)
- Don't go to conferences?
  - Chance to see firsthand what the field is like, where its going
  - There are student rates, you can share a room
  - Talk to people in the field in the halls!
  - If your faculty advisor won't pay, then pay it yourself; almost always offer student rates, can often share rooms
    - » Prof. Landay paid his own way to conferences while grad student
- Don't waste time polishing writing or talks?
  - In the marketplace of ideas, the more polish the more likely people will pay attention to your ideas
  - Practice presentation AND answering tough questions DAP Nov.'01 @UCB 6

#### Part II: Alternatives to a Bad Graduate Career

- Only work the number of hours per week you are paid?
  - Campus Faculty average is 65-70 hours/work; EECS higher
  - Students should be in that range
  - Organize each day: when most alert? nap? exercise? sleep?
  - When/how often/how long: write, read, program, email?
  - To do lists: daily, weekly, semester
- Industrial Experience?
  - 1st or 2nd summer get work experience, or 1 semester off
- Sutherland's advice (Father of Computer Graphics)
  - Be bold; Take chances on hard topics
  - see Technology and Courage URL on CS252, or search on Google
- Advice from a very successful recent student; Remzi Arpaci
  - Great ideas, did lots of papers, well thought of
  - I asked: Why do you think you did so well?
  - He said I gave him advice the first week he arrived
  - I asked: What did I say?
  - He said 3 observations, and still good advice today

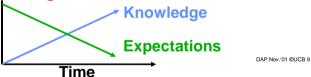

DAP Nov. '01 ©UCB 7

## Part II: How to be a Success in Graduate School

- 1) "Swim or Sink"
  - -"Success is determined by me (student) primarily"
  - -Faculty set up opportunity, but up to me leverage it
- 2) "Read/learn on your own"
  - -"Related to 1), you told me this as you handed me a stack of about 20 papers"
- 3) "Teach your advisor"
  - -"I really liked this concept; go out and learn about something and then teach the professor"
  - Fast moving field, don't expect Prof to be at forefront everywhere

## Summary Advice of Alternative to Bad Career in Graduate School

- Show Initiative!
  - don't wait for advisor (or more senior grad students) to show you what to do
- Ask questions!
  - lots of smart people in grad school (and even on the faculty), but don't be intimidated.
  - Either they know and you will learn, or they don't know and you will all learn by trying to determine the answer
- When to graduate

#### Outline

- Part I: Key Advice for a Bad Career while a Grad Student
- Part II: Key Advice on Alternatives to a Bad Graduate Career
- Part III: Key Advice for a Bad Career, Post Ph.D.
- Part IV: Key Advice on Alternatives to a Bad Career, Post Ph.D.
- · Topics covered in Parts III and IV
  - Selecting a Problem
  - Picking a Solution
  - Performing the Research
  - Evaluating the Results
  - Communicating Results
  - Transferring Technology

#### **Bad Career Move #1: Be THE leading expert**

- Invent a new field!
  - Make sure its slightly different
- · Be the real Lone Ranger: Don't work with others
  - No ambiguity in credit
  - Adopt the Prima Donna personality
- · Research Horizons
  - Never define success
  - Avoid Payoffs of less than 20 years
  - Stick to one topic for whole career
  - Even if technology appears to leave you behind, stand by your problem

## Announcing a New Operating System Field: "Disability-Based Systems"

- Computer Security is increasingly important
  - Insight: capability-based addressing almost right
- Idea: Create list of things that process CANNOT do!
- Key Question: should you store disabilities with each user or with the objects they can't access?
- Other topics: encrypted disabilities, disability-based addressing
- Start a new sequence of courses and new journal on Theory and Practice of Disability-Based Systems

## **Bad Career Move #2: Let Complexity Be Your Guide** (Confuse Thine Enemies)

- Best compliment:
- "Its so complicated, I can't understand the ideas"
- · Easier to claim credit for subsequent good ideas
  - If no one understands, how can they contradict your claim?
- · It's easier to be complicated
  - Also: to publish it must be different; N+1st incremental change
- If it were not unsimple then how could distinguished colleagues in departments around the world be positively appreciative of both your extraordinary intellectual grasp of the nuances of issues as well as the depth of your contribution?

#### **Bad Career Move #3: Never be Proven Wrong**

- Avoid Implementing
- Avoid Quantitative Experiments
  - If you've got good intuition, who needs experiments?
  - Why give grist for critics' mill?
  - Takes too long to measure
- Avoid Benchmarks
- Projects whose payoff is ≥ 20 years gives you 19 safe years

DAP Nov.'01 ©UCB 13 DAP Nov.'01 ©UCB 14

#### Bad Career Move #4: Use the Computer Scientific Method

#### **Obsolete Scientific Method**

- Hypothesis
- · Sequence of experiments
- Change 1 parameter/exp.
- Prove/Disprove Hypothesis
- Document for others to reproduce results

#### **Computer Scientific Method**

- Hunch
- 1 experiment & change all parameters
- · Discard if doesn't support hunch
- Why waste time? We know this

#### Bad Career Move #5: Don't be Distracted by Others (Avoid Feedback)

- Always dominate conversations: Silence is ignorance
  - Corollary: Loud is smart
- Don't read
- Don't be tainted by interaction with users, industry
- Reviews
  - If it's simple and obvious in retrospect => Reject
  - Quantitative results don't matter if they just show you what you already know => Reject
  - Everything else => Reject

DAP Nov.'01 ©UCB 15 DAP Nov.'01 ©UCB 16

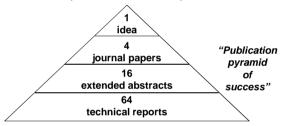

### Bad Career Move #6: Publishing Journal Papers IS Technology Transfer

- · Target Archival Journals: the Coin of the Academic Realm
  - It takes 2 to 3 years from submission to publication=>timeless
- As the leading scientist, your job is to publish in journals; its <u>not</u> your job to make you the ideas palatable to the ordinary engineer
- Going to conferences and visiting companies just uses up valuable research time
  - Travel time, having to interact with others, serve on program committees, ...

DAP Nov. '01 ©UCB 17

### Bad Career Move #7: Writing Tactics for a Bad Career

- · Papers: It's Quantity, not Quality
  - Personal Success = Length of Publication List
  - "The LPU (Least Publishable Unit) is Good for You"

- Student productivity = number of papers
  - Number of students: big is beautiful
  - Never ask students to implement: reduces papers
- Legally change your name to Aaaanderson

## **5 Writing Commandments for a Bad Career**

- I. Thou shalt not define terms, nor explain anything.
- II. Thou shalt replace "will do" with "have done".
- III. Thou shalt not mention drawbacks to your approach.
- IV. Thou shalt not reference any papers.
- V. Thou shalt publish before implementing.

## 7 Talk Commandments for a Bad Career

- I. Thou shalt not illustrate.
- II. Thou shalt not covet brevity.
- III. Thou shalt not print large.
- IV. Thou shalt not use color.
- V. Thou shalt cover thy naked slides.
- VI. Thou shalt not skip slides in a long talk.
- VII. Thou shalt not practice.

#### Following all the commandments

- We describe the philosophy and design of the control flow machine, and present the results of detailed simulations of the
  performance of a single processing element. Each factor is compared with the measured performance of an advanced von
  Neumann computer running equivalent code. It is shown that the control flow processor compares favorably in the program.
- We present a denotational semantics for a logic program to construct a control flow for the logic program. The control flow is
  defined as an algebraic manipulator of idempotent substitutions and it virtually reflects the resolution deductions. We also
  present a bottom-up compliation of medium grain culsters from a fine grain control flow graph. We compare the basic block
  and the dependence sets algorithms that partition control flow graphs into clusters.
- A hierarchical macro-control-flow computation allows them to exploit the coarse grain parallelism inside a macrotask, such as a a subroutine or a loop, hierarchically. We use a hierarchical definition of macrotasks, a parallelism extraction some among macrotasks defined inside an upper layer macrotask, and a scheduling scheme which assigns hierarchical macrotasks on hierarchical clusters.
- We apply a parallel simulation scheme to a real problem: the simulation of a control flow architecture, and we compare the performance of this simulator with that of a sequental one. Moreover, we investigate the effect of modeling the picacition on the performance of the simulator. Our study indicates that parallel simulation can reduce the execution time significantly if appropriate modeling is used.
- We have demonstrated that to achieve the best execution time for a control flow program, the number of nodes within the
  system and the type of mapping scheme used are particularly important. In addition, we observe that already
  subsystem nodes allows more actors to be fired concurrently, but the communication overhead in passing control tokens to
  their destination nodes causes the overall execution time to increase substantially.
- The relationship between the mapping scheme employed and locality effect in a program are discussed. The mapping scheme employed has to exhibit a strong locality effect in order to allow efficient execution
- Medium grain execution can benefit from a higher output bandwidth of a processor and finally, a simple superscalar processor
  with an issue rate of ten is sufficient to exploit the internal parallelism of a cluster. Although the technique does not
  exhaustively detect all possible errors, it detects nontrivial errors with a worst-case complexity quadratic to the system size. It
  can be automated and applied to systems with arbitrary loops and nondeterminism.

#### 7 Poster Commandments for a Bad Career

- I. Thou shalt not illustrate.
- II. Thou shalt not covet brevity.
- III. Thou shalt not print large.
- IV. Thou shalt not use color.
- V. Thou shalt not attract attention to thyself.
- VI. Thou shalt not prepare a short oral overview.
- VII. Thou shalt not prepare in advance.

DAP Nov.'01 ©UCB 21 DAP Nov.'01 ©UCB 22

## Following all the commandments

#### **Outline**

- Part I: Key Advice for a Bad Career while a Grad Student
- Part II: Key Advice on Alternatives to a Bad Graduate Career
- Part III: Key Advice for a Bad Career, Post Ph.D.
- Part IV: Key Advice on Alternatives to a Bad Career, Post Ph.D.
- · Topics covered in Parts III and IV
  - Selecting a Problem
  - Picking a Solution
  - Performing the Research
  - Evaluating the Results
  - Communicating Results
  - Transferring Technology

#### **Alternatives to Bad Papers**

- Do opposite of Bad Paper commandments
   Define terms, distinguish "will do" vs "have done",
   mention drawbacks, real performance, reference other papers.
- Find related work via Melvyl/INSPEC online search/paper retrieval vs. www only

www.dbs.cdlib.org

- · First read Strunk and White, then follow these steps;
  - 1. 1-page paper outline, with tentative page budget/section
  - 2. Paragraph map
    - » 1 topic phrase/sentence per paragraph, handdrawn figures w. captions
  - 3. (Re)Write draft
    - » Long captions/figure can contain details ~ Scientific American
    - » Uses Tables to contain facts that make dreary prose
  - 4. Read aloud, spell check & grammar check (MS Word; Under Tools, select Grammar, select Options, select "technical" for writing style vs. "standard"; select Settings and select)
  - 5. Get feedback from friends and critics on draft; go to 3.
- www.cs.berkeley.edu/~pattrsn/talks/writingtips.html

DAP Nov. '01 @UCB 25

FOREWORD BY ROGER ANGELL

#### **Alternatives to Bad Talks**

- Do opposite of Bad Talk commandments
  - I. Thou shalt not illustrate.
  - II. Thou shalt not covet brevity.
  - III. Thou shalt not print large.
  - IV. Thou shalt not use color.
  - V. Thou shalt cover thy naked slides.
  - VI. Thou shalt not skip slides in a long talk.
  - VII. Thou shalt not practice.
- · Allocate 2 minutes per slide, leave time for questions
- · Don't over animate
- · Do dry runs with friends/critics for feedback,
  - including tough audience questions
- Tape a practice talk (audio tape or video tape)
  - » Don't memorize speech, but have notes ready
- Bill Tetzlaff, IBM: "Giving a first class 'job talk' is the single most important part of an interview trip. Having someone know that you can give an excellent talk before hand greatly increases the chances of an invitation. That means great conference talks."

## **Alternatives to Bad Posters (from Randy Katz)**

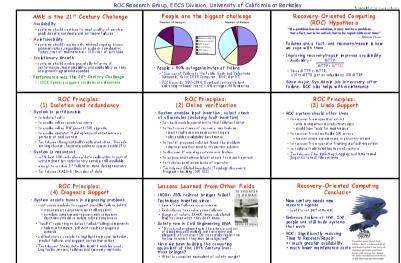

- · Answer Five Heilmeier Questions
  - 1. What is the problem you are tackling?
  - 2. What is the current state-of-the-art?
  - 3. What is your key make-a-difference concept or technology?
  - 4. What have you already accomplished?
  - 5. What is your plan for success?
- Do opposite of Bad Poster commandments
  - Poster tries to catch the eye of person walking by
- 9 page poster might look like

Problem Statement	State-of- the-Art	Key Concept
Accomplish -ment # 1	Title and Visual logo	Accomplish -ment # 2
Accomplish -ment # 3	Plan for Success	Summary & Conclusion

DAP Nov. '01 ©UCB 27

#### ROC: Recovery-Oriented Computing

Aaron Brown and David Patterson

#### One Alternative Strategy to a Bad Career

- · Caveats:
  - From a project leader's point of view
  - Works for me; not the only way
  - Primarily from academic, computer systems perspective
- · Goal is to have impact:

Change way people do Computer Science & Engineering

- Academics have bad benchmarks: published papers
- 6 Steps
  - 1) Selecting a problem
  - 2) Picking a solution
  - 3) Running a project
  - 4) Finishing a project
  - 5) Quantitative Evaluation
  - 6) Transferring Technology

DAP Nov. '01 ©UCB 29

## 1) Selecting a Problem

### Invent a new field & stick to it?

- No! Do "Real Stuff": solve problem that <u>someone</u> cares about
- No! Use separate, short projects
  - Always takes longer than expected
  - Matches student lifetimes
  - Long effort in fast changing field???
  - Learning: Number of projects vs. calendar time
  - If going to fail, better to know soon
- Strive for multi-disciplinary, multiple investigator projects
  - 1 expert/area is ideal (no arguments)
- Match the strengths and weaknesses of local environment
- Make sure you are excited enough to work on it for 3-5 years
  - Prototypes help Da

#### My first project

- Multiprocessor project with 3 hardware faculty ("Xtree")
- 1977: Design our own instruction set, microprocessor, interconnection topology, routing, boards, systems, operating system
- Unblemished Experience:
  - none in VLSI
  - none in microprocessors
  - none in networking
  - none in operating systems
- Unblemished Resources:
  - No staff
  - No dedicated computer (used department PDP-11/70)
  - No CAD tools
  - No applications
  - No funding
- Results: 2 journal papers, 12 conference papers, 20 TRs
- Impact?

DAP Nov. '01 @UCB 31

## 2) Picking a solution

## Let Complexity Be Your Guide?

- No! Keep things simple unless a very good reason not to
  - Pick innovation points carefully, and be compatible everywhere else
  - Best results are obvious in retrospect "Anyone could have thought of that"
- Complexity cost is in longer design, construction, test, and debug
  - Fast changing field + delays
     less impressive results

#### **Use the Computer Scientific Method?**

- No! Run experiments to discover real problems
- Use intuition to <u>ask</u> questions, not <u>answer</u> them

## (And Pick A Good Name!)

Reduced

Instruction

Set

Computers

Redundant

**Array** of

**I** nexpensive

Disks

Oriented

Computing

Recovery

• • •

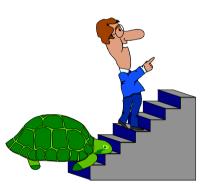

DAP Nov. '01 @UCB 33

#### Avoid Feedback?

- No! Periodic Project Reviews with Outsiders
  - Twice a year: 3-day retreat
  - faculty, students, staff + guests
  - Key piece is feedback at end
  - Helps create deadlines, team spirit
  - Give students chance to give many talks, interact with others industry
- Consider mid-course correction
  - Fast changing field & 3-5 year projects => assumptions changed
- Pick size and members of team carefully
- Tough personalities are hard for everyone
- Again, 1 faculty per area reduces chance of disagreement Nov.'01 ©UCB 34

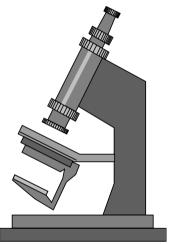

#### 4) Finishing a project

- People count projects you finish, not the ones you start
- <u>Successful projects</u> go through an unglamorous, hard phase
- Design is more fun than making it work
  - "No winners on a losing team; no losers on a winning team."
  - "You can quickly tell whether or not the authors have ever built something and made it work."
- · Reduce the project if its late
  - "Adding people to a late project makes it later."
- Finishing a project is how people acquire taste in selecting good problems, finding simple solutions

DAP Nov. '01 @UCB 35

## 5) Evaluating Quantitatively

#### **Never be Proven Wrong?**

- No! If you can't be proven wrong, then you can't prove you're right
- Report in sufficient detail for others to reproduce results
  - can't convince others if they can't get same results
- For better or for worse, benchmarks shape a field
- · Good ones accelerate progress
  - good target for development
- · Bad benchmarks hurt progress
  - help real users v. help sales?

## 6) Transferring

## **Publishing Journal Papers IS Technology Transfer?**

- No! Missionary work: "Sermons" first, then they read papers
  - Selecting problem is key: "Real stuff"
    - » Ideally, more interest as time passes
    - » Change minds with believable results
    - » Prima Donnas interfere with transfer
- . My experience: industry is reluctant to embrace change
  - Howard Aiken, circa 1950:
  - "The problem in this business isn't to keep people from stealing your ideas; its making them steal your ideas!"
  - Need 1 bold company (often not no. 1) to take chance and be successful
  - » RISC with Sun, RAID with (Compaq, EMC, ...)
  - Then rest of industry must follow

DAP Nov. '01 @UCB 37

## 6) Transferring Technology

#### Pros

- Personal satisfaction: seeing your product used by others
- Personal \$\$\$ (potentially)
- Fame

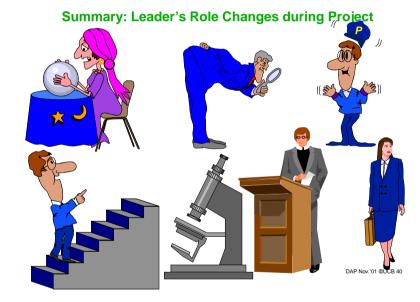

#### • Cons

- Learn about business plans, sales vs. marketing, financing, personnel benefits, hiring, ...
- Spend time doing above vs. research/development
- Only 10% of startups really make it
- Fame if company unsuccessful too (e.g., dot.com backlash)

  DAP Nov.'01 @UCB 38

## Richard Hamming's Advice: "You and Your Research" (Latter in your Research Career)

- . Doing Nobel Quality Research
  - Search Google for transcript of 1986 talk at Bell Labs
- Luck? "Luck favors the prepared mind." Pasteur
- Important Problems: "Great Thoughts Time" Friday afternoons
- Courage: think about important unsolved problems
  - Big results usually to problems not recognized as such and people usually did not get encouragement
- Working conditions: can use creatively to lead to original solutions
  - Bell labs didn't have acres of programmers
- Drive: what distinguishes the great scientists
  - Not brains; commitment vs. dabbling; compound interest over time
- Open doors (vs. closed offices): short term vs. long term benefit
- · Selling the work: not only published, but people must read it
  - as much work spent on polish and presentation as on the work itself
- Age: After 1st big success, hard to work on small problems
  - So change field at least every 10 years
- Educate your boss, Stimulation, right amount of Library Work work and the second sec

## **Acknowledgments**

 Many of these ideas were borrowed from (inspired by?) Tom Anderson, David Culler, Al Davis, Ken Goldberg, John Hennessy, Steve Johnson, John Ousterhout, Randy Katz, Bob Sproull, Carlo Séquin, Bill Tetzlaff and many others

#### Conclusion: Alternatives to a Bad Career

- Goal is to have impact:
   Change way people do Computer Science & Engineering
  - Many 3 5 year projects gives more chances for impact
- · Feedback is key: seek out and value critics
- Do "Real Stuff": make sure you are solving some problem that someone cares about
- Taste is critical in selecting research problems, solutions, experiments, and communicating results;
  - Taste acquired by feedback and completing projects
- Faculty real legacy is people, not paper:
  - create environments that develop professionals of whom you are proud
- . Students are the coin of the academic realm

# Backup Slides to Help Answer Questions

## **Applying the Computer Scientific Method to OS**

- · Create private, highly tuned version for testing
  - take out all special checks: who cares about crashes during benchmarks?
- Never give out code of private version
  - might be embarrassing, no one expects it
- Run experiments repeatedly, discarding runs that don't confirm the generic OS hypothesis
  - Corollary

DAP Nov.'01 @UCB 43 DAP Nov.'01 @UCB 44
