

Timely Rays: using data-flow to accelerate rendering

Thomas Parks

November 28, 2017

U. of Cam

Introduction

What is a RayTracer?

Photorealistic Easy to understand Slow

How do they work?

Timely Dataflow

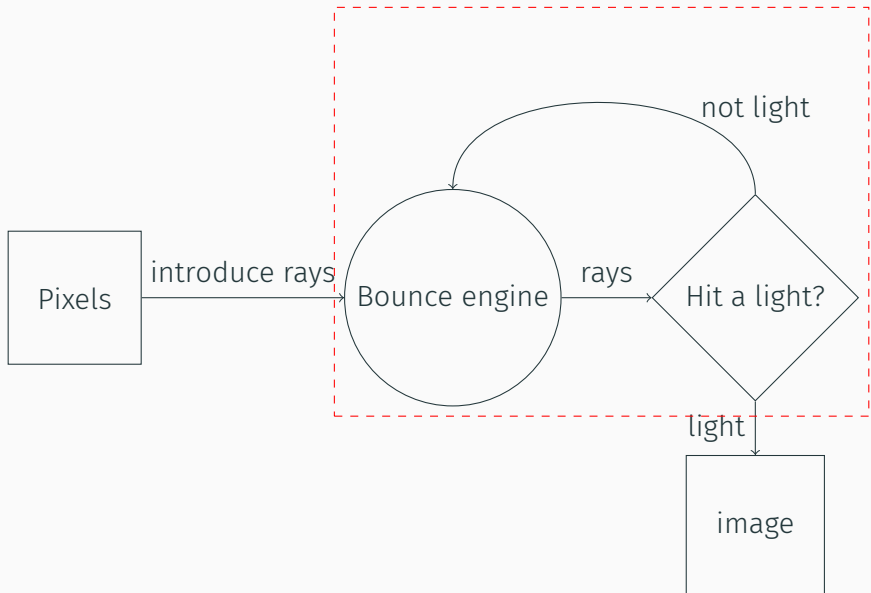

What is a Timely Dataflow?

~~Timely dataflow is a low-latency cyclic dataflow computational model~~

~~Nat's description was lovely, thank you.~~

Jesse's presentation from week 3 was excellent, refer to that.

Flowing rays

Progress Report

Single scene

It looks like this:

One object and one material

Only implemented a single shape, a single internally-illuminated material, and a single scene.

```
enum Hittable {  
    Sphere(Sphere),  
    // Rect(Rect),  
    // Ngon(Ngon), // Hybrid modes!  
    // RichardSpencer() // is a Hittable  
}
```

One thread

```
let captured = timely::example(move |scope| {
    pixlocs.to_stream(scope)
        .map(move |loc| {
            (loc, get_color(loc))
        })
        .accumulate(EMPTYIMG,
            |IMG, data| {
                IMG[locs] += data;
            })
        .capture()
});
```

Early days yet! Perhaps this will be the next Cycles.

Thank you!
