From Rewrite Rules to Bisimulation Congruences

Peter Sewell[1]

May 29, 1998

Abstract

The dynamics of many calculi can be most clearly defined by a reduction semantics. To work with a calculus, however, an understanding of operational congruences is fundamental; these can often be given tractable definitions or characterisations using a labelled transition semantics. This paper considers calculi with arbitrary reduction semantics of three simple classes, firstly ground term rewriting, then left-linear term rewriting, and then a class which is essentially the action calculi lacking substantive name binding. General definitions of labelled transitions are given in each case, uniformly in the set of rewrite rules, and without requiring the prescription of additional notions of observation. They give rise to bisimulation congruences. As a test of the theory it is shown that bisimulation for a fragment of CCS is recovered. The transitions generated for a fragment of the Ambient Calculus of Cardelli and Gordon, and for SKI combinators, are also discussed briefly.

Contents

1 Introduction

The dynamic behaviour of many calculi can be defined most clearly by a *reduction semantics*, comprising a set of rewrite rules, a set of reduction contexts in which they may be applied, and a structural congruence. These define the atomic internal reduction steps of terms. To work with a calculus, however, a compositional understanding of the behaviour of arbitrary subterms, as given by some operational congruence relation, is usually required. The literature contains investigations of such congruences for a large number of particular calculi. They are often given tractable definitions or characterisations via *labelled transition relations*, capturing the potential external interactions between subterms and their environments. Defining labelled transitions that give rise to

---

satisfactory operational congruences generally requires some mix of calculus-specific ingenuity and routine work.

In this paper the problem is addressed for arbitrary calculi of certain simple forms. We give general definitions of labelled transitions that depend only on a reduction semantics, without requiring any additional observations to be prescribed. We first consider term rewriting, with ground or left-linear rules, over an arbitrary signature but without a structural congruence. We then consider calculi with arbitrary signatures containing symbols 0 and $|$, a structural congruence consisting of associativity, commutativity and unit, left-linear rules, and non-trivial sets of reduction contexts. This suffices, for example, to express CCS-style synchronisation. It is essentially the same as the class of Action Calculi in which all controls have arity $0 \to 0$ and take some number of arguments of arity $0 \to 0$. In each case we define labelled transitions, prove that bisimulation is a congruence and give some comparison results.

Background: From reductions to labelled transitions to reductions... Definitions of the dynamics (or small-step operational semantics) of lambda calculi and sequential programming languages have commonly been given as reduction relations. The λ-calculus has the rewrite rule $(\lambda x.M)N \longrightarrow M[N/x]$ of β reduction, which can be applied in any context. For programming languages, some control of the order of evaluation is usually required. This has been done with abstract machines, in which the states, and reductions between them, are ad-hoc mathematical objects. More elegantly, one can give definitions in the structural operational semantics (SOS) style of Plotkin [Plo81]; here the states are terms of the language (sometimes augmented by e.g. a store), the reductions are given by a syntax-directed inductive definition. Explicit reformulations using rewrite rules and reduction contexts were first given by Felleisen and Friedman [FF86]. (We neglect semantics in the big-step/evaluation/natural style.)

In contrast, until recently, definitions of operational semantics for process calculi have been primarily given as labelled transition relations. The central reason for the difference is not mathematical, but that lambda and process terms have had quite different intended interpretations. The standard interpretation of lambda terms and functional programs is that they specify computations which may either not terminate, or terminate with some result that cannot reduce further. Confluence properties ensure that such result terms are unique if they exist; they can implicitly be examined, either up to equality or up to a coarser notion. The theory of processes, however, inherits from automata theory the view that process terms may both reduce internally and interact with their environments; labelled transitions allow these interactions to be expressed. Reductions may create or destroy potential interactions. Termination of processes is usually not a central concept, and the structure of terms, even of terms that cannot reduce, is not considered examinable.

An additional, more technical, reason is that definitions of the reductions for a process calculus require either auxiliary labelled transition relations or a non-trivial structural congruence. For example, consider the CCS fragment below.

$$P ::= 0 \mid \alpha.P \mid \bar{\alpha}.P \mid P \mid P \qquad \alpha \in \mathcal{A}$$

Its standard semantics has reductions $P \longrightarrow Q$ but also labelled transitions $P \xrightarrow{\alpha} Q$ and $P \xrightarrow{\bar{\alpha}} Q$. These represent the potentials that P has for synchronising on α. They can be defined by an SOS

$$\text{OUT} \; \frac{}{\bar{\alpha}.P \xrightarrow{\bar{\alpha}} P} \qquad\qquad \text{IN} \; \frac{}{\alpha.P \xrightarrow{\alpha} P}$$

$$\text{COM} \; \frac{P \xrightarrow{\bar{\alpha}} P' \quad Q \xrightarrow{\alpha} Q'}{P \mid Q \longrightarrow P' \mid Q'} \qquad\qquad \text{COM}' \; \frac{P \xrightarrow{\alpha} P' \quad Q \xrightarrow{\bar{\alpha}} Q'}{P \mid Q \longrightarrow P' \mid Q'}$$

$$\text{PAR} \; \frac{P \xrightarrow{\mu} Q}{P \mid R \xrightarrow{\mu} Q \mid R} \qquad\qquad \text{PAR}' \; \frac{P \xrightarrow{\mu} Q}{R \mid P \xrightarrow{\mu} R \mid Q}$$

where $\xrightarrow{\mu}$ is either $\longrightarrow$, $\xrightarrow{\alpha}$ or $\xrightarrow{\bar{\alpha}}$. It has been noted by Berry and Boudol [BB92], following work of Banâtre and Le Métayer [BM86] on the Γ language, that semantic definitions of process calculi could be simplified by working modulo an equivalence that allows the parts of a redex to be brought syntactically adjacent. Their presentation is in terms of Chemical Abstract Machines; in a slight variation we give a reduction semantics for the CCS fragment above. It consists of the rewrite rule $\bar{\alpha}.P \mid \alpha.Q \longrightarrow P \mid Q$, the set of reduction contexts given by

$$C ::= \_ \ \Big| \ C \mid P \ \Big| \ P \mid C$$

and the structural congruence $\equiv$ defined to be the least congruence satisfying $P \equiv P \mid 0$, $P \mid Q \equiv Q \mid P$ and $P \mid (Q \mid R) \equiv (P \mid Q) \mid R$. Modulo use of $\equiv$ on the right, this gives exactly the same reductions as before. For this toy calculus the two are of similar complexity. For the π-calculus ([MPW92], building on [EN86]), however, Milner has given a reduction semantics that is much simpler that the rather delicate SOS definitions of π labelled transition systems [Mil92]. Following this, more recent name passing process calculi have often been defined by a reduction semantics in some form, e.g. the HOπ [San93], ρ [NM95], Join [FG96], Blue [Bou97], Spi [AG97], dpi [Sew98], Dπ [RH98] and Ambient [CG98] Calculi.

Turning to operational congruences, for confluent calculi the definition of an appropriate operational congruence is relatively straightforward, even in the (usual) case where the dynamics is expressed as a reduction relation. For example, for a simple eager functional programming language, with a base type Int of integers, terminated states of programs of type Int are clearly observable up to equality. These basic observations can be used to define a Morris-style operational congruence. Several authors have considered tractable characterisations of these congruences in terms of bisimulation – see e.g. [How89, AO93, Gor95] and the references therein, and [GR96] for related work on an object calculus.

For non-confluent calculi the situation is more problematic – process calculi having labelled transition semantics have been equipped with a plethora of different operational equivalences, whereas rather few styles of definition have been proposed for those having reduction semantics. In the labelled transition case there are many more-or-less plausible notions of observation, differing e.g. in their treatment of linear/branching time, of internal reductions, of termination and divergence, etc. Some of the space is illustrated in the surveys of van Glabbeek [Gla90, Gla93]. The difficulty here is to select a notion that is appropriate for a particular application; one attempt is in [Sew97]. In the reduction case we have the converse problem – a reduction relation does not of itself seem to support any notion of observation that gives rise to a satisfactory operational congruence. This was explicitly addressed for CCS and π-calculi by Milner and Sangiorgi in [MS92, San93], where barbed bisimulation equivalences are defined in terms of reductions and observations of *barbs*. These are vestigial labelled transitions, similar to the distinguished observable transitions in the *tests* of De Nicola and Hennessy [DH84]. The expressive power of their calculi suffices to recover early labelled transition bisimulations as the induced congruences. Related work of Honda and Yoshida [HY95] uses *insensitivity* as the basic observable.

...to labelled transitions Summarizing, definitions of operational congruences, for calculi having reduction semantics, have generally been based either on observation of terminated states, in the confluent case, or on observation of some barbs, where a natural definition of these exists. In either case, characterisations of the congruences in terms of labelled transitions, involving as little quantification over contexts as possible, are desirable. Moreover, some reasonable calculi may not have a natural definition of barb that induces an appropriate congruence.

In this paper we show that labelled transitions that give rise to bisimulation congruences can be defined purely from the reduction semantics of a calculus, without prescribing any additional observations. It is preliminary work, in that only simple classes of reduction semantics, not involving name or variable binding, will be considered. As a test of the definitions we show that they recover the usual bisimulation on the CCS fragment above. We also discuss term rewriting and a fragment of

the Ambient calculus of Cardelli and Gordon. To directly express the semantics of more interesting calculi requires a richer framework. One must deal with binding, with rewrite rules involving term or name substitutions, with a structural congruence that allows scope mobility, and with more delicate sets of reduction contexts. The *Action Calculi* of Milner [Mil96] are a candidate framework that allows several of the calculi mentioned above to be defined cleanly; this work can be seen as a step towards understanding operational congruences for arbitrary action calculi.

Labelled transitions intuitively capture the possible interactions between a term and a surrounding context. Here this is made explicit – the labels of transitions from a term s will be contexts that, when applied to s, create an occurrence of a rewrite rule. A similar approach has been followed by Jensen [Jen98], for a form of graph rewriting that idealizes action calculi. Bisimulation for a particular action calculus, representing a π-calculus, has been studied by Mifsud [Mif96]. In the next three sections we develop the theory for ground term rewriting, then for left-linear term rewriting, and then with the addition of an AC1 structural congruence and reduction contexts. Section 5 contains some concluding remarks. Most proofs are banished to the appendices.

2   Ground term rewriting

In this section we consider one of the simplest possible classes of reduction semantics, that of ground term rewriting. The definitions and proofs are here rather straightforward, but provide a guide to those in the following two sections.

Reductions   We take a *signature* consisting of a set Σ of function symbols, ranged over by σ, and an arity function $|\_|$ from Σ to $\mathbb{N}$. Context composition and application of contexts to (tuples of) terms are written $A \cdot B$ and $A \cdot s$, the identity context as $\_$ and tupling with $+$. We say an n-hole context is *linear* if it has exactly one occurrence of each of its holes. In this section a, b, l, r, s, t range over terms, A, B, C, D, F, H range over linear unary contexts and E ranges over linear binary contexts.

We take a set $\mathcal{R}$ of *rewrite rules*, each consisting of a pair $\langle l, r \rangle$ of terms. The *reduction relation* is then

$$s \longrightarrow t \quad \overset{def}{\Leftrightarrow} \quad \exists \langle l, r \rangle \in \mathcal{R}, C \, . \, s = C \cdot l \wedge C \cdot r = t$$

Labelled Transitions   The transitions of a term s will be labelled by linear unary contexts. Transitions $s \overset{\_}{\longrightarrow} t$ labelled by the identity context are simply reductions (or τ-transitions). Transitions $s \overset{F}{\longrightarrow} t$ for $F \not\equiv \_$ indicate that applying F to s creates an instance of a rewrite rule, with target instance t. For example, given the rule

$$\gamma(\beta) \longrightarrow \delta$$

we will have labelled transitions

$$C \cdot \gamma(\beta) \overset{\_}{\longrightarrow} C \cdot \delta$$

for all C and

$$\beta \overset{\gamma(\_)}{\longrightarrow} \delta$$

The *labels* are $\{ F \mid \exists \langle l, r \rangle \in \mathcal{R}, s \, . \, F \cdot s = l \}$ and the *contextual labelled transition relations* $\overset{F}{\longrightarrow}$ are defined by:

- $s \overset{\_}{\longrightarrow} t \overset{def}{\Leftrightarrow} s \longrightarrow t$

- $s \overset{F}{\longrightarrow} t \overset{def}{\Leftrightarrow} \exists \langle l, r \rangle \in \mathcal{R} \, . \, F \cdot s = l \wedge r = t \qquad$ for $F \neq \_$

Bisimulation Congruence   Let $\sim$ be strong bisimulation with respect to these transitions. The congruence proof is straightforward.   It is given some detail as a guide to the more intricate corresponding proofs in the following two sections, which have the same structure.   Three lemmas (2–4) show how contexts in labels and in the sources of transitions interrelate; they are proved by case analysis using a dissection lemma which is standard folklore.

LEMMA 1 (DISSECTION) *If $A \cdot a = B \cdot b$ then one of the following cases holds.*

1. *(b is in a) There exists D such that $a = D \cdot b$ and $A \cdot D = B$.*

2. *(a is properly in b) There exists D with $D \neq \_$ such that $D \cdot a = b$ and $A = B \cdot D$.*

3. *(a and b are disjoint) There exists E such that $A = E \cdot (\_ + b)$ and $B = E \cdot (a + \_)$.*

PROOF   This is a straightforward corollary of Lemma 6 below. Case 1 of that lemma with $m_1 = 1$ gives 1, case 1 with $m_2 = 1$ gives 3 and case 2 gives 1 or 2.   □

LEMMA 2 *If $A \cdot s \overset{\_}{\longrightarrow} t$ then one of the following holds:*

1. *There exists some H such that $t = H \cdot s$ and for any $\hat{s}$ we have $A \cdot \hat{s} \overset{\_}{\longrightarrow} H \cdot \hat{s}$.*

2. *There exists some $\hat{t}$, A_1 and A_2 such that $A = A_1 \cdot A_2$, $s \overset{A_2}{\longrightarrow} \hat{t}$ and $t = A_1 \cdot \hat{t}$.*

PROOF   By the definition of reduction

$$\exists \langle l, r \rangle \in \mathcal{R}, C . \ A \cdot s = C \cdot l \wedge C \cdot r = t$$

Applying the dissection lemma (Lemma 1) to $A \cdot s = C \cdot l$ gives the following cases.

1. (l is in s) There exists B such that $s = B \cdot l$ and $A \cdot B = C$.
   Taking $\hat{t} = B \cdot r$, $A_1 = A$ and $A_2 = \_$ the second clause holds.

2. (s is properly in l) There exists B with $B \neq \_$ such that $B \cdot s = l$ and $A = C \cdot B$.
   Taking $\hat{t} = r$, $A_1 = C$ and $A_2 = B$ the second clause holds.

3. (s and l are disjoint) There exists E such that $A = E \cdot (\_ + l)$ and $C = E \cdot (s + \_)$.
   Taking $H = E \cdot (\_ + r)$ the first clause holds.

<div align="right">□</div>

LEMMA 3 *If $A \cdot s \overset{F}{\longrightarrow} t$ and $F \neq \_$ then $s \overset{F \cdot A}{\longrightarrow} t$.*

PROOF   By the definition of labelled transitions

$$\exists \langle l, r \rangle \in \mathcal{R} . \ F \cdot A \cdot s = l \wedge r = t$$

Clearly $F \cdot A$ is linear and $F \cdot A \neq \_$ so $s \overset{F \cdot A}{\longrightarrow} t$.   □

LEMMA 4 *If $s \overset{F \cdot A}{\longrightarrow} t$ then $A \cdot s \overset{F}{\longrightarrow} t$.*

PROOF   If $F \cdot A = \_$ then $F = A = \_$ so the conclusion is immediate, otherwise by the definition of transitions

$$\exists \langle l, r \rangle \in \mathcal{R} . \ F \cdot A \cdot s = l \wedge r = t$$

One then has $A \cdot s \overset{F}{\longrightarrow} t$ by the definition of transitions, by cases for $F \neq \_$ and $F = \_$.   □

PROPOSITION 5 $\sim$ *is a congruence.*

PROOF We show

$$\mathcal{S} \stackrel{def}{=} \{\, A \cdot s, A \cdot s' \mid s \sim s' \wedge A : 1 \to 1 \text{ linear} \,\}$$

is a bisimulation.

1. Suppose $A \cdot s \stackrel{-}{\longrightarrow} t$.

   By Lemma 2 one of the following holds:

   (a) There exists some H such that $t = H \cdot s$ and for any $\hat{s}$ we have $A \cdot \hat{s} \stackrel{-}{\longrightarrow} H \cdot \hat{s}$.
   Hence $A \cdot s' \stackrel{-}{\longrightarrow} H \cdot s'$.
   Clearly $H \cdot s \; \mathcal{S} \; H \cdot s'$.

   (b) There exists some $\hat{t}$, A_1 and A_2 such that $A = A_1 \cdot A_2$, $s \stackrel{A_2}{\longrightarrow} \hat{t}$ and $t = A_1 \cdot \hat{t}$.
   By $s \sim s'$ there exists $\hat{t}'$ such that $s' \stackrel{A_2}{\longrightarrow} \hat{t}' \sim \hat{t}$.
   By Lemma 4 $A_2 \cdot s' \stackrel{-}{\longrightarrow} \hat{t}'$.
   By the definition of reduction $A_1 \cdot A_2 \cdot s' \stackrel{-}{\longrightarrow} A_1 \cdot \hat{t}'$.
   Clearly $A_1 \cdot \hat{t} \; \mathcal{S} \; A_1 \cdot \hat{t}'$.

2. Suppose $A \cdot s \stackrel{F}{\longrightarrow} t$ for $F \neq \_$.

   By Lemma 3 $s \stackrel{F \cdot A}{\longrightarrow} t$.

   By $s \sim s'$ there exists t' such that $s' \stackrel{F \cdot A}{\longrightarrow} t' \sim t$.

   By Lemma 4 $A \cdot s' \stackrel{F}{\longrightarrow} t'$.

   Clearly $t \; \mathcal{S} \; t'$.

<div align="right">□</div>

Remark An alternative approach would be to take transitions

- $s \stackrel{F}{\longrightarrow}_{\text{alt}} t \stackrel{def}{\Longleftrightarrow} F \cdot s \longrightarrow t$

for unary linear contexts F. Note that these are defined using only the reduction relation, whereas the definition above involved the reduction rules. Let $\sim_{\text{alt}}$ be strong bisimulation with respect to these transitions. One can show that $\sim_{\text{alt}}$ is a congruence and moreover is unaffected by cutting down the label set to that considered above. In general $\sim_{\text{alt}}$ is strictly coarser than $\sim$.   For an example of the non-inclusion, if the signature consists of constants α, β and a unary symbol γ with reduction rules $\alpha \longrightarrow \alpha$, $\beta \longrightarrow \beta$ and $\gamma(\beta) \longrightarrow \beta$, then $\alpha \not\sim \beta$ whereas $\alpha \sim_{\text{alt}} \beta$.   The details can be found in Appendix A. This insensitivity to the possible interactions of terms that have internal transitions suggests that the analogue of $\sim_{\text{alt}}$, in more expressive settings, is unlikely to coincide with standard bisimulations for particular calculi. Indeed, one can show that applying the alternative definition to the fragment of CCS

$$P ::= 0 \mid \alpha \mid \bar{\alpha} \mid P \mid P \qquad \alpha \in \mathcal{A}$$

(with its usual reduction relation) gives an equivalence that identifies $\alpha \mid \bar{\alpha}$ with $\beta \mid \bar{\beta}$.

Remark In the proofs of Lemmas 2–4 the labelled transition exhibited for the conclusion involves the same rewrite rule as the transition in the premise. One could therefore take the finer transitions $\stackrel{F}{\longrightarrow}_{\langle l, r \rangle}$, annotated by rewrite rules, and still have a congruence result. In some cases this gives a finer bisimulation relation.

Remark   The labelled transition relation is linear in $\mathcal{R}$, i.e. the labelled transitions generated by a union $\mathcal{R}_1 \cup \mathcal{R}_2$ of sets of rewrite rules are just the union of the relations generated by $\mathcal{R}_1$ and $\mathcal{R}_2$.

3   Term rewriting with left-linear rules

In this section the definitions are generalised to left-linear term rewriting, as a second step towards a framework expressive enough for simple process calculi.

Notation   In the next two sections we must consider more complex dissections of contexts and terms. It is convenient to treat contexts and terms uniformly, working with n-tuples of m-hole contexts for $m, n \geq 0$. Concretely, we work in the category $\mathbb{C}_\Sigma$ that has the natural numbers as objects and morphisms

$$\frac{i \in 1..m}{\langle \_i \rangle_m : m \to 1} \qquad \frac{\langle a_1 \rangle_m : m \to 1 \ \cdots \ \langle a_n \rangle_m : m \to 1}{\langle a_1, \ldots, a_n \rangle_m : m \to n} \qquad \frac{\langle a_1, \ldots, a_{|\sigma|} \rangle_m : m \to |\sigma|}{\langle \sigma(a_1, \ldots, a_{|\sigma|}) \rangle_m : m \to 1}$$

The identity on m is $\mathbf{id}_m \stackrel{def}{=} \langle \_1, \ldots, \_m \rangle_m$, composition is substitution, with $\langle a_1, \ldots, a_n \rangle_m \cdot \langle b_1, \ldots, b_m \rangle_l = \langle a_1[b_1/\_1, \ldots, b_m/\_m], \ldots, a_n[b_1/\_1, \ldots, b_m/\_m] \rangle_l$. $\mathbb{C}_\Sigma$ has strictly associative binary products, written with $+$. If $a : m \to k$ and $b : m \to l$ we write $a \oplus b$ for $(a + b) \cdot \langle \_1, \ldots, \_m, \_1, \ldots, \_m \rangle_m : m \to k + l$. Angle brackets and domain subscripts will often be elided. We let $a, b, e, q, r, s, t, u, v$ range over $0 \to m$ morphisms, i.e. m-tuples of terms, $A, B, \ldots$ range over $m \to 1$ morphisms, i.e. m-hole contexts, and π over projections and permutations. Say a morphism $\langle a_1, \ldots, a_n \rangle_m$ is *linear* if it contains exactly one occurrence of each $\_1, \ldots, \_m$ and *affine* if it contains at most one occurrence of each. We sometimes abuse notation in examples, writing $\_, \_1, \_2, \ldots$ instead of $\_1, \_2, \_3, \ldots$.

Remark   Many slight variations of $\mathbb{C}_\Sigma$ are possible. We have chosen to take the objects to be natural numbers, instead of finite sets of variables, to give a lighter notation for labels. The concrete syntax is chosen so that morphisms from 0 to 1 are exactly the standard terms over Σ, modulo elision of the angle brackets and subscript 0.

Reductions   The usual notion of left-linear term rewriting is now expressible as follows. We take a set $\mathcal{R}$ of *rewrite rules*, each consisting of a triple $\langle n, L, R \rangle$ where $n \geq 0$, $L : n \to 1$ is linear and $R : n \to 1$. The *reduction relation* over $\{ s \mid s : 0 \to 1 \}$ is then defined by

$$s \longrightarrow t \quad \stackrel{def}{\Leftrightarrow} \quad \exists \langle m, L, R \rangle \in \mathcal{R}, C : 1 \to 1 \text{ linear}, u : 0 \to m . \ s = C \cdot L \cdot u \wedge C \cdot R \cdot u = t$$

Labelled Transitions   The labelled transitions of a term $s : 0 \to 1$ will again be of two forms, $s \stackrel{-}{\longrightarrow} t$, for internal reductions, and $s \stackrel{F}{\longrightarrow} T$ where $F \neq \_$ is a context that, together with part of s, makes up the left hand side of a rewrite rule. For example, given the rule

$$\delta(\gamma(\_)) \longrightarrow \epsilon(\_)$$

we will have labelled transitions

$$\gamma(s) \stackrel{\delta(\_)}{\longrightarrow} \epsilon(s)$$

for all terms $s : 0 \to 1$. Labelled transitions in which the label contributes the whole of the left hand side of a rule would be redundant, so the definition will exclude e.g. $s \stackrel{\delta(\gamma(\_))}{\longrightarrow} \epsilon(s)$. Now consider the rule

$$\sigma(\alpha, \gamma(\_)) \longrightarrow \epsilon(\_)$$

As before there will be labelled transitions

$$\gamma(s)\overset{\sigma(\alpha,\text{-})}{\longrightarrow}\epsilon(s)$$

for all s. In addition, one can construct instances of the rule by placing the term α in contexts $\sigma(\text{-},\gamma(t))$, suggesting labelled transitions $\alpha\overset{\sigma(\text{-},\gamma(t))}{\longrightarrow}\epsilon(t)$ for any t. Instead, to keep the label sets small, and to capture the uniformity in t, we allow both labels and targets of transitions to be parametric in un-instantiated arguments of the rewrite rule. In this case the definition will give

$$\alpha\overset{\sigma(\text{-},\gamma(\text{-}_1))}{\longrightarrow}\epsilon(\text{-}_1)$$

In general, then, the *contextual labelled transitions* are of the form $s\overset{F}{\longrightarrow}T$, for $s:0\to1$, $F:1+n\to1$ and $T:n\to1$. The first argument of F is the hole in which s can be placed to create an instance of a rule L; the other n arguments are parameters of L that are not thereby instantiated. The transitions are defined as follows.

- $s\overset{\text{-}}{\longrightarrow}T\overset{def}{\Leftrightarrow}s\longrightarrow T$.

- $s\overset{F}{\longrightarrow}T$, for $F:1+n\to1$ linear and not the identity, iff there exist

$$\langle m,L,R\rangle\in\mathcal{R}\text{ with }m\geq n$$
$$\pi:m\to m\text{ a permutation}$$
$$L_1:(m-n)\to1\text{ linear and not the identity}$$
$$u:0\to(m-n)$$

  such that

$$\begin{aligned}L&=F\cdot(L_1+\mathbf{id}_n)\cdot\pi\\s&=L_1\cdot u\\T&=R\cdot\pi^{-1}\cdot(u+\mathbf{id}_n)\end{aligned}$$

The definition is illustrated in Figure 1. The restriction to $L_1\neq\mathbf{id}_1$ excludes transitions where the label contributes the whole of L. The permutation π is required so that the parameters of L can be divided into the instantiated and uninstantiated. For example the rule

$$\rho(\delta(\text{-}_1),\gamma(\text{-}_2),\beta)\longrightarrow\sigma(\text{-}_1,\text{-}_2)$$

will give rise to transitions

$$\delta(s)\overset{\rho(\text{-},\gamma(\text{-}_1),\beta)}{\longrightarrow}\sigma(s,\text{-}_1)\qquad\beta\overset{\rho(\delta(\text{-}_1),\gamma(\text{-}_2),\text{-})}{\longrightarrow}\sigma(\text{-}_1,\text{-}_2)$$
$$\gamma(s)\overset{\rho(\delta(\text{-}_1),\text{-},\beta)}{\longrightarrow}\sigma(\text{-}_1,s)\qquad\beta\overset{\rho(\delta(\text{-}_2),\gamma(\text{-}_1),\text{-})}{\longrightarrow}\sigma(\text{-}_2,\text{-}_1)$$

(The last is redundant; it could be excluded by requiring π to be a monotone partition of m into $m-n$ and n.)

Bisimulation Congruence   A binary relation $\mathcal{S}$ over terms $\{\,a\mid a:0\to1\,\}$ is lifted to a relation over $\{\,A\mid A:n\to1\,\}$ by $A\,[\mathcal{S}]\,A'\overset{def}{\Leftrightarrow}\forall b:0\to n\,.\;\;A\cdot b\,\mathcal{S}\,A'\cdot b$. Say $\mathcal{S}$ is a bisimulation if for any $s\,\mathcal{S}\,s'$

- $s\overset{F}{\longrightarrow}T\Rightarrow\exists T'\,.\;\;s'\overset{F}{\longrightarrow}T'\wedge T\,[\mathcal{S}]\,T'$

- $s'\overset{F}{\longrightarrow}T'\Rightarrow\exists T\,.\;\;s\overset{F}{\longrightarrow}T\wedge T\,[\mathcal{S}]\,T'$

and write $\sim$ for the largest such. As before the congruence proof requires a simple dissection lemma and three lemmas relating contexts in sources and labels.   Their proofs can be found in Appendix B.
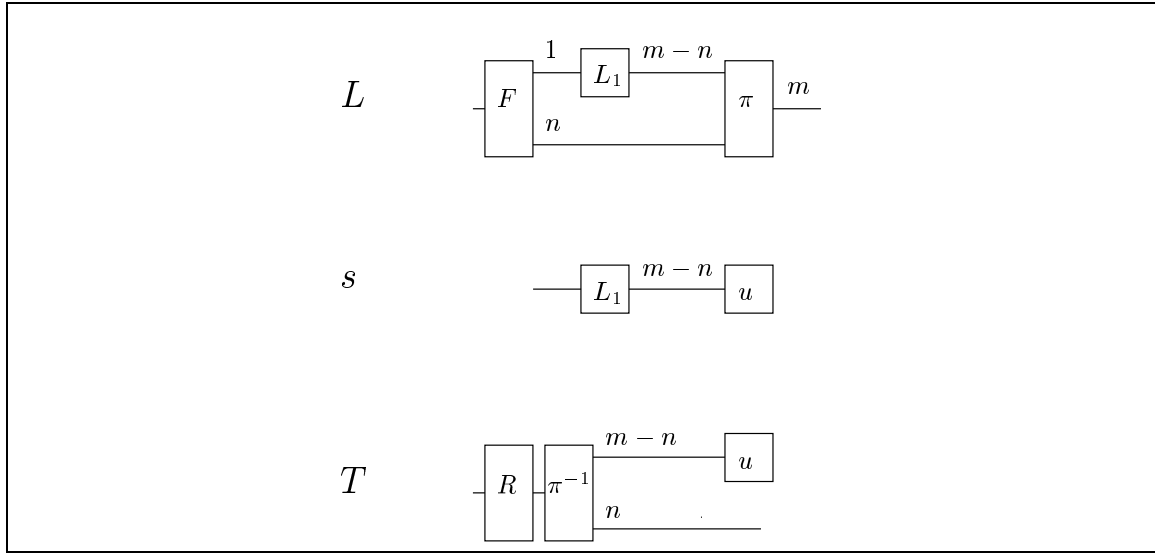

Figure 1: Contextual Labelled Transitions for Left-Linear Term Rewriting. Boxes with m input wires (on their right) and n output wires (on their left) represent n-tuples of m-hole contexts. Wires are ordered from top to bottom.

LEMMA 6 (DISSECTION) *If $A \cdot a = B \cdot b$, for $m \geq 0$, $A : 1 \to 1$ and $B : m \to 1$ linear, $a : 0 \to 1$ and $b : 0 \to m$ then one of the following holds.*

1. *(a is not in any component of b) There exist*

$$m_1 \text{ and } m_2 \text{ such that } m_1 + m_2 = m$$
$$\pi_i : m \to m_i \text{ for } i \in \{1, 2\} \text{ a partition}$$
$$C : 1 + m_2 \to 1 \text{ linear}$$
$$D : m_1 \to 1 \text{ linear and not the identity}$$

such that

$$
\begin{aligned}
A &= C \cdot (\mathbf{id}_1 + \pi_2 \cdot b) \\
a &= D \cdot \pi_1 \cdot b \\
B &= C \cdot (D + \mathbf{id}_{m_2}) \cdot (\pi_1 \oplus \pi_2)
\end{aligned}
$$

i.e. there are m_1 components of b in a and m_2 in A.

2. *(a is in a component of b) $m \geq 1$ and there exist*

$$\pi_1 : m \to 1 \text{ and } \pi_2 : m \to (m - 1) \text{ a partition}$$
$$E : 1 \to 1 \text{ linear}$$

such that

$$
\begin{aligned}
A &= B \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot b) \\
E \cdot a &= \pi_1 \cdot b
\end{aligned}
$$

LEMMA 7 *If $A \cdot s \overset{-}{\to} t$ and $A : 1 \to 1$ linear then one of the following holds.*

1. *There exists some $H : 1 \to 1$ such that $t = H \cdot s$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \overset{-}{\to} H \cdot \hat{s}$.*

2. *There exist*

$$k \geq 0$$
$$F : 1 + k \to 1 \ linear$$
$$T : k \to 1$$
$$D : 1 \to 1 \ linear$$
$$v : 0 \to k$$

such that $s \xrightarrow{F} T$, $A = D \cdot F \cdot (\mathbf{id}_1 + v)$ *and* $t = D \cdot T \cdot v$.

LEMMA 8 *If* $A \cdot s \xrightarrow{F} T$ *for* $A : 1 \to 1$ *linear,* $F : 1 + n \to 1$ *and* $F \neq \mathbf{id}_1$ *then one of the following holds.*

1. *There exists* $H : 1 + n \to 1$ *such that* $T = H \cdot (s + \mathbf{id}_n)$ *and for all* $\hat{s} : 0 \to 1$ *we have* $A \cdot \hat{s} \xrightarrow{F} H \cdot (\hat{s} + \mathbf{id}_n)$.

2. *There exist*

$$p \geq 0$$
$$E : 1 + p \to 1 \ linear$$
$$\hat{T} : p + n \to 1$$
$$v : 0 \to p$$

such that $s \xrightarrow{F \cdot (E + \mathbf{id}_n)} \hat{T}$, $T = \hat{T} \cdot (v + \mathbf{id}_n)$ *and* $A = E \cdot (\mathbf{id}_1 + v)$.

LEMMA 9 *If* $s \xrightarrow{C \cdot (E + \mathbf{id}_n)} T$ *for* $E : 1 + p \to 1$ *linear and* $C : 1 + n \to 1$ *linear then for all* $v : 0 \to p$ *we have* $E \cdot (s + v) \xrightarrow{C} T \cdot (v + \mathbf{id}_n)$.

THEOREM 1 $\sim$ *is a congruence.*

PROOF We show $\mathcal{S}^*$, where

$$\mathcal{S} \stackrel{def}{=} \{ A \cdot s, A \cdot s' \mid s \sim s' \wedge A : 1 \to 1 \ \text{linear} \}$$

is a bisimulation. First note that for any $A : 1 \to 1$ and $s \sim s'$ we have $A \cdot s \ \mathcal{S}^* \ A \cdot s'$. To see this, take $n \geq 0$ and $\hat{A} : n \to 1$ linear such that $A = \hat{A} \cdot \langle {}_{\text{-}1}, \ldots, {}_{\text{-}1} \rangle_1$. Let

$$
\begin{aligned}
A_1 &\stackrel{def}{=} \hat{A} \cdot \langle {}_{\text{-}1}, s, s, \ldots, s \rangle_1 \\
A_2 &\stackrel{def}{=} \hat{A} \cdot \langle s', {}_{\text{-}1}, s, \ldots, s \rangle_1 \\
&\ldots \\
A_n &\stackrel{def}{=} \hat{A} \cdot \langle s', s', s', , \ldots, {}_{\text{-}1} \rangle_1
\end{aligned}
$$

Each A_i is linear, so $A_i \cdot s \ \mathcal{S} \ A_i \cdot s'$. Moreover $A_i \cdot s' = A_{i+1} \cdot s$ for $i \in 1..n-1$ so $A \cdot s = A_1 \cdot s \ \mathcal{S}^n A_n \cdot s' = A \cdot s'$.

We now show that if $A : 1 \to 1$ linear, $s \sim s'$ and $A \cdot s \xrightarrow{F} T$ then there exists T' such that $A \cdot s' \xrightarrow{F} T'$ and $T \ [\mathcal{S}^*] \ T'$.

1. Suppose $A \cdot s \xrightarrow{-} t$.

   By Lemma 7 one of the following holds:

   (a) There exists some $H : 1 \to 1$ such that $t = H \cdot s$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \xrightarrow{-} H \cdot \hat{s}$. Hence $A \cdot s' \xrightarrow{-} H \cdot s'$.

      Clearly $t = H \cdot s \ \mathcal{S}^* \ H \cdot s'$.

(b) There exist

$$
\begin{aligned}
&k \geq 0 \\
&F : 1 + k \to 1 \text{ linear} \\
&T : k \to 1 \\
&D : 1 \to 1 \text{ linear} \\
&v : 0 \to k
\end{aligned}
$$

such that $s \xrightarrow{F} T$, $A = D \cdot F \cdot (\mathbf{id}_1 + v)$ and $t = D \cdot T \cdot v$.

By $s \sim s'$ there exists T' such that $s' \xrightarrow{F} T' \wedge T \; [\sim] \; T'$.

By Lemma 9 $F \cdot (s' + v) \overset{=}{\to} T' \cdot v$.

By the definition of reduction $A \cdot s' = D \cdot F \cdot (s' + v) \overset{=}{\to} D \cdot T' \cdot v$.

Clearly $t = D \cdot T \cdot v \; \mathcal{S}^* \; D \cdot T' \cdot v$.

2. Suppose $A \cdot s \xrightarrow{F} T$ for $F : 1 + n \to 1$ linear and $F \neq \mathbf{id}_1$.

   By Lemma 8 one of the following holds.

   (a) There exists $H : 1 + n \to 1$ such that $T = H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \xrightarrow{F} H \cdot (\hat{s} + \mathbf{id}_n)$.

   Hence $A \cdot s' \xrightarrow{F} H \cdot (s' + \mathbf{id}_n)$

   Clearly $T = H \cdot (s + \mathbf{id}_n) \; [\mathcal{S}^*] \; H \cdot (s' + \mathbf{id}_n)$.

   (b) There exist

$$
\begin{aligned}
&p \geq 0 \\
&E : 1 + p \to 1 \text{ linear} \\
&\hat{T} : p + n \to 1 \\
&v : 0 \to p
\end{aligned}
$$

   such that $s \xrightarrow{F \cdot (E + \mathbf{id}_n)} \hat{T}$, $T = \hat{T} \cdot (v + \mathbf{id}_n)$ and $A = E \cdot (\mathbf{id}_1 + v)$.

   By $s \sim s'$ there exists $\hat{T}'$ such that $s' \xrightarrow{F \cdot (E + \mathbf{id}_n)} \hat{T}' \wedge \hat{T} \; [\sim] \; \hat{T}'$.

   By Lemma 9 $A \cdot s' = E \cdot (s' + v) \xrightarrow{F} \hat{T}' \cdot (v + \mathbf{id}_n)$.

   Clearly $T = \hat{T} \cdot (v + \mathbf{id}_n) \; [\mathcal{S}^*] \; \hat{T}' \cdot (v + \mathbf{id}_n)$.

Now if

$$
A_1 \cdot s_1 \; \mathcal{S} \; A_1 \cdot s_2' = A_2 \cdot s_2 \; \mathcal{S} \ldots \mathcal{S} \; A_{n-1} \cdot s_n'
$$

for A_i linear and $s_i \sim s_{i+1}'$, for $i \in 1..n - 1$, and $A_1 \cdot s_1 \xrightarrow{F} T_1$ then by the above there exists T_n such that $A_{n-1} \cdot s_n' \xrightarrow{F} T_n$ and $T_1 \; [\mathcal{S}^*]^n \; T_n$, so $T_1 \; [\mathcal{S}^*] \; T_n$.

$\square$

Remark This definition reduces to that of Section 2 if all rules are ground. For open rules, instead of allowing parametric labels, one could simply close up the rewrite rules under instantiation, by $\mathrm{Cl}(\mathcal{R}) = \{ \langle 0, L \cdot u, R \cdot u \rangle \mid \langle n, L, R \rangle \in \mathcal{R} \wedge u : 0 \to n \}$, and apply the earlier definition. In general this would give a strictly coarser congruence. For an example of the non-inclusion, take a signature consisting of a nullary α and a unary γ, with $\mathcal{R}$ consisting of the rules $\gamma(\_) \longrightarrow \gamma(\_)$ and $\gamma(\gamma(\alpha)) \longrightarrow \gamma(\gamma(\alpha))$. We have $\mathrm{Cl}(\mathcal{R}) = \{ \gamma^n \alpha, \gamma^n \alpha \mid n \geq 1 \}$. The transitions are

$$
\begin{array}{llll}
\gamma^n \alpha & \xrightarrow{\;-\;}_{\mathcal{R}} & \gamma^n \alpha & \qquad \gamma^n \alpha \quad \xrightarrow{\;-\;}_{\mathrm{Cl}(\mathcal{R})} \quad \gamma^n \alpha \\
\alpha & \xrightarrow{\gamma(\gamma(\_))}_{\mathcal{R}} & \gamma(\gamma(\alpha)) & \qquad \alpha \quad \xrightarrow{\gamma^n}_{\mathrm{Cl}(\mathcal{R})} \quad \gamma^n \alpha \\
\gamma(\alpha) & \xrightarrow{\gamma(\_)}_{\mathcal{R}} & \gamma(\gamma(\alpha)) & \qquad \gamma^m \alpha \quad \xrightarrow{\gamma^n}_{\mathrm{Cl}(\mathcal{R})} \quad \gamma^{m+n} \alpha
\end{array}
$$

for $m, n \geq 1$, so $\gamma(\alpha) \not\sim_{\mathcal{R}} \gamma(\gamma(\alpha))$ but $\gamma(\alpha) \sim_{\mathrm{Cl}(\mathcal{R})} \gamma(\gamma(\alpha))$. The proof of the following proposition can be found in Appendix B.

PROPOSITION 10 *If $s \sim_{\mathcal{R}} s'$ then $s \sim_{\mathrm{Cl}(\mathcal{R})} s'$.*

Comparison   Bisimulation as defined here is a congruence for arbitrary left-linear term rewriting systems. Much work on term rewriting deals with reduction relations that are confluent and terminating. In that setting terms have unique normal forms; the primary equivalence on terms is $\simeq$, where $s \simeq t$ if s and t have the same normal form. This is easily proved to be a congruence. In general, it is incomparable with $\sim$. To see one non-inclusion, note that $\sim$ is sensitive to atomic reduction steps; for the other that $\sim$ is not sensitive to equality of terms – for example, with only nullary symbols α, β, γ, and rewrite rule $\gamma \longrightarrow \beta$, we have $\alpha \sim \beta$ and $\beta \simeq \gamma$, whereas $\alpha \not\simeq \beta$ and $\beta \not\sim \gamma$. One might address the second non-inclusion by fiat, adding, for any value v, a unary test operator H_v and reduction rule $H_v(v) \longrightarrow v$. For the first, one might move to a weak bisimulation, abstracting from reduction steps. The simplest alternative is to take $\approx$ to be the largest relation $\mathcal{S}$ such that if $s \mathrel{\mathcal{S}} s'$ then

- $s \overset{-}{\longrightarrow} T \Rightarrow \exists T' .\; s' \overset{-}{\longrightarrow}{}^* T' \wedge T \;[\mathcal{S}]\; T'$

- $(s \overset{F}{\longrightarrow} T \wedge F \neq \_) \Rightarrow \exists T' .\; s' \overset{-}{\longrightarrow}{}^* \overset{F}{\longrightarrow} T' \wedge T \;[\mathcal{S}]\; T'$

and symmetric clauses.

Say the set $\mathcal{R}$ of rewrite rules is *right-affine* if the right hand side of each rule is affine. The following congruence result is proved in Appendix B; whether it holds without the restriction on $\mathcal{R}$ is left open.

THEOREM 2 *If $\mathcal{R}$ is right-affine then $\approx$ is a congruence.*

Example – Integer addition   For some rewrite systems $\approx$ coincides with $\simeq$. Taking a signature Σ comprising nullary $\underline{z}$ for each integer z and binary plus and ifzero, and rewrite rules

$$
\begin{aligned}
\mathrm{plus}(\underline{x}, \underline{z}) &\longrightarrow \underline{x+z} \\
\mathrm{ifzero}(\underline{0}, \_) &\longrightarrow \_
\end{aligned}
$$

for all integers x and z gives labelled transitions

$$
\begin{aligned}
\underline{x} &\xrightarrow{\mathrm{plus}(\_, \underline{z})} \underline{x+z} \\
\underline{x} &\xrightarrow{\mathrm{plus}(\underline{z}, \_)} \underline{x+z} \\
\underline{0} &\xrightarrow{\mathrm{ifzero}(\_, \_1)} \_1
\end{aligned}
$$

together with the reductions $\overset{-}{\longrightarrow}$. Here the normal forms are simply the integers; $\approx$ and $\simeq$ both coincide with integer equality.

In general, however, $\approx$ is still incomparable with $\simeq$. For example, with unary δ, γ, nullary α, and rules $\gamma(\alpha) \longrightarrow \alpha$, $\delta(\alpha) \longrightarrow \alpha$, and $\delta(\gamma(\_)) \longrightarrow \_$, we have $\alpha \not\simeq \beta(\alpha)$. This may be a pathological rule set; one would like to have conditions excluding it under which $\approx$ and $\simeq$ coincide.

Example – SKI Combinators   Taking a signature Σ comprising nullary I, K, S and binary $\bullet$, and rewrite rules

$$
\begin{aligned}
S \bullet \_1 \bullet \_2 \bullet \_3 &\longrightarrow \_1 \bullet \_3 \bullet (\_2 \bullet \_3) \\
K \bullet \_1 \bullet \_2 &\longrightarrow \langle \_1 \rangle_2 \\
I \bullet \_1 &\longrightarrow \_1
\end{aligned}
$$

gives labelled transitions

$$
\begin{array}{llll}
S & \xrightarrow{-\bullet_{-1}\bullet_{-2}\bullet_{-3}} & {}_{-1}\bullet_{-3}\bullet({}_{-2}\bullet_{-3}) & \qquad K \quad \xrightarrow{-\bullet_{-1}\bullet_{-2}} \quad \langle{}_{-1}\rangle_2 \\
S\bullet s & \xrightarrow{-\bullet_{-1}\bullet_{-2}} & s\bullet_{-2}\bullet({}_{-1}\bullet_{-2}) & \qquad K\bullet s \quad \xrightarrow{-\bullet_{-1}} \quad \langle s\rangle_1 \\
S\bullet s\bullet t & \xrightarrow{-\bullet_{-1}} & s\bullet_{-1}\bullet(t\bullet_{-1}) & \qquad I \quad \xrightarrow{-\bullet_{-1}} \quad {}_{-1}
\end{array}
$$

together with some permutation instances of these and the reductions $\longrightarrow$. The significance of $\sim$ and $\approx$ here is unclear. Note that the rules are not right-affine, so Theorem 2 does not guarantee that $\approx$ is a congruence. It is quite intensional, being sensitive to the number of arguments that can be consumed immediately by a term. For example, $K\bullet(K\bullet s)\not\approx S\bullet(K\bullet(K\bullet s))$.

4 Term rewriting with left-linear rules, parallel and boxing

In this section we extend the setting to one sufficiently expressive to define the reduction relations of simple process calculi. We suppose the signature Σ includes binary and nullary symbols $|$ and 0, for parallel and nil, and take a structural congruence $\equiv$ generated by associativity, commutativity and identity axioms. Parallel will be written infix. The reduction rules $\mathcal{R}$ are as before. We now allow symbols to be *boxing*, i.e. to inhibit reduction in their arguments. For each $\sigma\in\Sigma$ we suppose given a set $\mathcal{B}(\sigma)\subseteq\{1,\ldots,|\sigma|\}$ defining the argument positions where reduction may take place. We require $\mathcal{B}(|)=\{1,2\}$. The *reduction contexts* $\mathcal{C}\subseteq\{\,C\mid C:1\to1 \text{ linear}\,\}$ are generated by

$$
\mathbf{id}_1\in\mathcal{C} \qquad\qquad \frac{i\in\mathcal{B}(\sigma) \quad \langle a\rangle_1\in\mathcal{C}}{\langle\sigma(s_1,\ldots,s_{i-1},a,s_{i+1},\ldots,s_{|\sigma|})\rangle_1\in\mathcal{C}}
$$

Formally, structural congruence is defined over all morphisms of $\mathbb{C}_\Sigma$ as follows. It is a family of relations indexed by domain and codomain arities; the indexes will usually be elided.

$$
\frac{\langle a\rangle_m:m\to1}{\langle a\rangle_m\equiv_{m,1}\langle a\mid0\rangle_m} \qquad \frac{\langle a_i\rangle_m:m\to1 \quad i\in\{1,2\}}{\langle a_1\mid a_2\rangle_m\equiv_{m,1}\langle a_2\mid a_1\rangle_m} \qquad \frac{\langle a_i\rangle_m:m\to1 \quad i\in\{1,2,3\}}{\langle a_1\mid(a_2\mid a_3)\rangle_m\equiv_{m,1}\langle(a_1\mid a_2)\mid a_3\rangle_m}
$$

$$
\frac{i\in 1..m}{\langle{}_{-i}\rangle_m\equiv_{m,1}\langle{}_{-i}\rangle_m} \qquad\qquad \frac{\langle a_1\rangle_m\equiv_{m,1}\langle b_1\rangle_m \;\cdots\; \langle a_n\rangle_m\equiv_{m,1}\langle b_n\rangle_m}{\langle a_1,\ldots,a_n\rangle_m\equiv_{m,n}\langle b_1,\ldots,b_n\rangle_m}
$$

$$
\frac{f\equiv_{m,n}g}{g\equiv_{m,n}f} \qquad\qquad \frac{f\equiv_{m,n}g \quad g\equiv_{m,n}h}{f\equiv_{m,n}h} \qquad\qquad \frac{\langle a_1,\ldots,a_{|\sigma|}\rangle_m\equiv_{m,|\sigma|}\langle b_1,\ldots,b_{|\sigma|}\rangle_m}{\langle\sigma(a_1,\ldots,a_{|\sigma|})\rangle_m\equiv_{m,1}\langle\sigma(b_1,\ldots,b_{|\sigma|})\rangle_m}
$$

Reductions The *reduction relation* over $\{\,s\mid s:0\to1\,\}$ is defined by $s\longrightarrow t$ iff

$$
\exists\langle m,L,R\rangle\in\mathcal{R},C\in\mathcal{C},u:0\to m\,.\ s\equiv C\cdot L\cdot u\wedge C\cdot R\cdot u\equiv t
$$

This class of calculi is essentially the same as the class of Action Calculi in which there is no substantive name binding, i.e. those in which all controls K have arity rules of the form

$$
\frac{a_1:0\to0 \;\cdots\; a_r:0\to0}{K(a_1,\ldots,a_r):0\to0}
$$

(here the a_i are actions, not morphisms from $\mathbb{C}_\Sigma$). It includes simple process calculi. For example, the fragment of CCS in Section 1 can be specified by taking a signature Σ_{CCS} consisting of unary $\alpha.$ and $\bar\alpha.$ for each $\alpha\in\mathcal{A}$, with 0 and $|$, and rewrite rules

$$
\begin{aligned}
\mathcal{R}_{\mathrm{CCS}} &= \{\,\langle 2,\alpha._{-1}\mid\bar\alpha._{-2},\,{}_{-1}\mid{}_{-2}\rangle\mid\alpha\in\mathcal{A}\,\} \\
\mathcal{B}_{\mathrm{CCS}}(\alpha.) &= \mathcal{B}_{\mathrm{CCS}}(\bar\alpha.)=\{\}
\end{aligned}
$$

Notation   For a context $f : m \to n$ and $i \in 1..m$ say f is *shallow in argument i* if all occurrences of $\_i$ in f are not under any symbol except $|$. Say f is *deep in argument i* if any occurrence of $\_i$ in f is under some symbol not equal to $|$. Say f is *shallow* (*deep*) if it is shallow (deep) in all $i \in 1..m$. Say f is *i-separated* if there are no occurrences of any $\_j$ in parallel with an occurrence of $\_i$.   Say f is *i-clean* if $\_i$ does not occur in parallel with any term, and f is *clean* if it is i-clean for all $i \in 1..m$.

Labelled Transitions   The labelled transitions will be of the same form as in the previous section, with transitions $s \xrightarrow{F} T$ for $s : 0 \to 1$, $F : 1 + n \to 1$ and $T : n \to 1$. A non-trivial label F may either contribute a deep subcontext of the left hand side of a rewrite rule (analogous to the non-identity labels of the previous section) or a parallel component, respectively with F deep or shallow in its first argument. The cases must be treated differently. For example, the rule

$$\alpha \mid \beta \longrightarrow \gamma$$

will generate labelled transitions

$$s \mid \alpha \xrightarrow{\; \_ \mid \beta \;} s \mid \gamma \qquad s \mid \beta \xrightarrow{\; \_ \mid \alpha \;} s \mid \gamma$$

for all $s : 0 \to 1$. As before, transitions that contribute the whole of the left hand side of a rule, such as $s \xrightarrow{\; \_ \mid \alpha \mid \beta \;} s \mid \gamma$, are redundant and will be excluded. It is necessary to take labels to be subcontexts of left hand sides of rules up to structural congruence, not merely up to equality. For example, given the rule

$$(\alpha \mid \beta) \mid (\gamma \mid \delta) \longrightarrow \epsilon$$

we need labelled transitions

$$\alpha \mid \gamma \mid r \xrightarrow{\; \_ \mid (\beta \mid \delta) \;} \epsilon \mid r$$

Finally, the existence of rules in which arguments occur in parallel with non-trivial terms means that we must deal with partially instantiated arguments. Consider the rule

$$\sigma(\tau(\_1) \mid \_3, \_2) \longrightarrow R$$

The term $\tau(\mu) \mid \rho$ could be placed in any context $\sigma(\_ \mid s, t)$ to create an instance of the left hand side, with μ (from the term) instantiating $\_1$, t (from the context) instantiating $\_2$, and $\rho \mid s$ (from both) instantiating $\_3$. There will be a labelled transition

$$\tau(\mu) \mid \rho \xrightarrow{\; \sigma(\_ \mid \_2, \_1) \;} R \cdot \langle \mu, \_1, \rho \mid \_2 \rangle_2$$

parametric in two places but partially instantiating the second by ρ. The general definition of transitions is given in Figure 2. It uses additional notation – we write $\mathbf{par}_n$ for $\langle \_1 \mid (\ldots \mid \_n) \rangle_n : n \to 1$ and $\mathbf{ppar}_n$ for $\langle \_1 \mid \_{n+1}, \ldots, \_n \mid \_{n+n} \rangle_{n+n} : n + n \to n$.   Some parts of the definition are illustrated in Figure 3, in which rectangles denote contexts and terms, triangles denote instances of $\mathbf{par}$, and hatched triangles denote instances of $\mathbf{ppar}$.

To a first approximation, the definition for F deep in 1 states that $s \xrightarrow{F} T$ iff there is a rule $L \longrightarrow R$ such that L can be factored into L_2 (with m_2 arguments) enclosing L_1 (with m_1 arguments) in parallel with m_3 arguments. The source s is L_1 instantiated by u, in parallel with e; the label F is roughly L_2; the target T is R with m_1 arguments instantiated by u and m_3 partially instantiated by e. It is worth noting that the non-identity labelled transitions do not depend on the set of reduction contexts.

The intended intuition is that the labelled transition relations provide just enough information so that the reductions of a term $A \cdot s$ are determined by the labelled transitions of s and the structure of A, which is the main property required for a congruence proof.   Inspection of the proof of Lemma 24 (in Appendix C.2) may make this seem plausible, but a precise result, showing that the labelled transitions provide no extraneous information, would be desirable.

Transitions $s \xrightarrow{F} T$, for $s : 0 \to 1$, $F : 1 + n \to 1$ linear and $T : n \to 1$, are defined by:

- For $F \equiv \mathbf{id}_1$: $s \xrightarrow{F} T$ iff

$$\exists \langle m, L, R \rangle \in \mathcal{R}, C \in \mathcal{C}, u : 0 \to m . \ \ s \equiv C \cdot L \cdot u \wedge C \cdot R \cdot u \equiv T$$

- For F deep in argument 1: $s \xrightarrow{F} T$ iff there exist

$\langle m, L, R \rangle \in \mathcal{R}$
m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$ and $n = m_3 + m_2$
$\pi : m \to m$ a permutation
$L_1 : m_1 \to 1$ linear and deep
$L_2 : 1 + m_2 \to 1$ linear, deep in argument 1 and 1-separated
$u : 0 \to m_1$
$e : 0 \to m_3$

such that

$$L \equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_1 + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot \pi$$
$$s \equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot u + e)$$
$$T \equiv R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})$$
$$F \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$$
$$m_3 = 1 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$$

- For F shallow in argument 1 and $F \not\equiv \mathbf{id}_1$: $s \xrightarrow{F} T$ iff there exist

$\langle m, L, R \rangle \in \mathcal{R}$
m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$ and $n = m_3 + m_2$
$\pi : m \to m$ a permutation
$q : 0 \to 1$
$L_1 : m_1 \to 1$ linear and deep
$L_2 : m_2 \to 1$ linear and deep
$u : 0 \to m_1$
$e : 0 \to m_3$

such that

$$L \equiv \mathbf{par}_{2+m_3} \cdot (L_1 + \mathbf{id}_{m_3} + L_2) \cdot \pi$$
$$s \equiv \mathbf{par}_{2+m_3} \cdot (q + L_1 \cdot u + e)$$
$$T \equiv \mathbf{par}_2 \cdot (q + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}))$$
$$F \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)$$
$$m_3 = 0 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$$
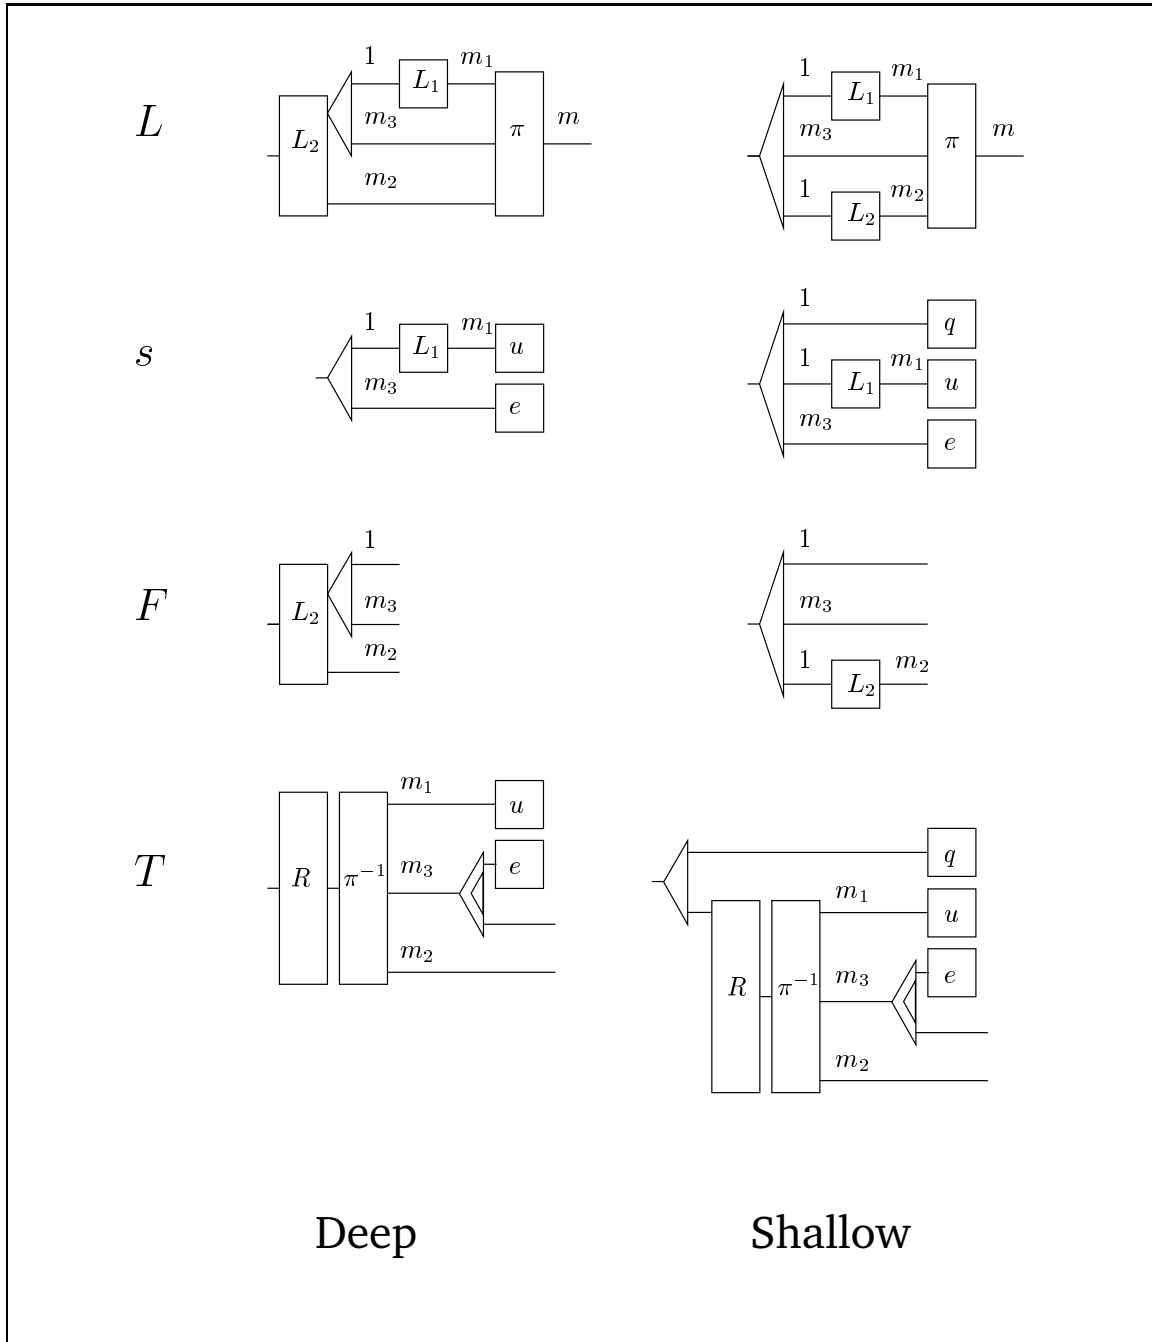

Figure 2: Contextual Labelled Transitions

Figure 3: Contextual Labelled Transitions Illustrated

Bisimulation Congruence   Bisimulation $\sim$ is defined exactly as in the previous section.   As before, the congruence proof requires dissection lemmas, analogous to Lemmas 1 and 6, lemmas showing that if $A \cdot s$ has a transition then s has a related transition, analogous to Lemmas 2,3 and 7,8, and partial converses to these, analogous to Lemmas 4 and 9.   All except the main dissection lemma are deferred to Appendix C.

LEMMA 11 (DISSECTION)   *If $m \geq 0$,*

$$
\begin{array}{ll}
A : 1 \to 1 & B : m \to 1 \\
a : 0 \to 1 & b : 0 \to m
\end{array}
$$

with A and B linear, and $A \cdot a \equiv B \cdot b$, then one of the following hold

1.   *(a is not deeply in any component of b) There exist*

$$
\begin{array}{l}
m_1, m_2 \text{ and } m_3 \text{ such that } m_1 + m_2 + m_3 = m \\
\pi_1 : m \to m_1, \ \pi_2 : m \to m_2 \text{ and } \pi_3 : m \to m_3 \text{ a partition} \\
C : 1 + m_2 \to 1 \text{ linear and 1-separated} \\
D : m_1 \to 1 \text{ linear and deep} \\
e_1 : 0 \to m_3 \\
e_2 : 0 \to m_3
\end{array}
$$

   such that

$$
\begin{array}{rcl}
A & \equiv & C \cdot (\mathbf{par}_{1+m_3} \cdot (\mathbf{id}_1 + e_2) + \pi_2 \cdot b) \\
a & \equiv & \mathbf{par}_{1+m_3} \cdot (D \cdot \pi_1 \cdot b + e_1) \\
B & \equiv & C \cdot (\mathbf{par}_{1+m_3} \cdot (D + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2) \\
\pi_3 \cdot b & \equiv & \mathbf{ppar}_{m_3} \cdot (e_1 + e_2)
\end{array}
$$

   There are m_1 of the b in a, m_2 of the b in A and m_3 of the b potentially overlapping A and a. The latter are split into e_1, in a, and e_2, in A.

2.   *(a is deeply in a component of b) $m \geq 1$ and there exist*

$$
\begin{array}{l}
\pi_1 : m \to 1 \text{ and } \pi_2 : m \to (m - 1) \text{ a partition} \\
E : 1 \to 1 \text{ linear and deep}
\end{array}
$$

   such that

$$
\begin{array}{rcl}
A & \equiv & B \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot b) \\
E \cdot a & \equiv & \pi_1 \cdot b
\end{array}
$$

The first clause of the lemma is illustrated in Figure 4. For example, consider $A \cdot a \equiv B \cdot b \equiv \sigma(\tau(\mu_1) \mid \rho_1 \mid \rho_2, \mu_2)$, where

$$
\begin{array}{rclcrcl}
A & = & \sigma(\_ \mid \rho_2, \mu_2) & \qquad & B & = & \sigma(\tau(\_1) \mid \_3, \_2) \\
a & = & \tau(\mu_1) \mid \rho_1 & & b & = & \langle \mu_1, \mu_2, \rho_1 \mid \rho_2 \rangle_0
\end{array}
$$

Clause 1 of the lemma holds, with

$$
\begin{array}{rclcrcl}
C & = & \sigma(\_1, \_2) & \qquad & m & = & 3 \\
D & = & \tau(\_1) & & m_1 & = & 1 \\
e_1 & = & \rho_1 & & m_2 & = & 1 \\
e_2 & = & \rho_2 & & m_3 & = & 1 \\
\pi_1 \cdot b & = & \mu_1 & & \pi_1 & = & \langle \_1 \rangle_3 \\
\pi_2 \cdot b & = & \mu_2 & & \pi_2 & = & \langle \_2 \rangle_3 \\
& & & & \pi_3 & = & \langle \_3 \rangle_3
\end{array}
$$

Figure 4: Clause 1 of Dissection Lemma

This dissection should give rise to a transition

$$\tau(\mu_1) \mid \rho_1 \xrightarrow{\sigma(-\mid\, {}_{-2},{}_{-1})} R \cdot \langle \mu_1, {}_{-2}, {}_{-1} \mid \rho_1 \rangle_2$$

(taking A, a, B, b to be the D, s, L, u in case **4(a)i** of Lemma 24).

THEOREM 3 $\sim$ *is a congruence.*

PROOF We show that $(\equiv \mathcal{S})^*$, where

$$\mathcal{S} \stackrel{def}{=} \{ A \cdot s, A \cdot s' \mid s \sim s' \wedge A : 1 \to 1 \text{ linear} \}$$

is a bisimulation. As before, note that for any $A : 1 \to 1$ and $s \sim s'$ we have $A \cdot s \, \mathcal{S}^* \, A \cdot s'$. We first show that if $A : 1 \to 1$ linear, $s \sim s'$ and $A \cdot s \xrightarrow{F} T$ then there exists T' such that $A \cdot s' \xrightarrow{F} T'$ and $T \equiv [\mathcal{S}^*] \, T'$.

1. Suppose $A \cdot s \xrightarrow{I} t$ and $I \equiv \mathbf{id}_1$. By Lemma 24 one of the following holds:

    (a) There exists some $H : 1 \to 1$ such that $t \equiv H \cdot s$ and $\forall \hat{s} : 0 \to 1 . \;\; A \cdot \hat{s} \xrightarrow{-} H \cdot \hat{s}$.
        Hence $A \cdot s' \xrightarrow{-} H \cdot s'$.
        Clearly $t \equiv H \cdot s \, \mathcal{S}^* \, H \cdot s'$.

    (b) There exist $n \geq 0$, $F : (1 + n) \to 1$ linear, $T : n \to 1$, $C \in \mathcal{C}$ and $v : 0 \to n$ such that $s \xrightarrow{F} T$, $A \equiv C \cdot F \cdot (\mathbf{id}_1 + v)$ and $t \equiv C \cdot T \cdot v$.
        By $s \sim s'$ there exists T' such that $s' \xrightarrow{F} T' \wedge T \, [\sim] \, T'$.

By Lemma 27 $F \cdot (s' + v) \overset{-}{\longrightarrow} T' \cdot v$.

By the definition of reduction $A \cdot s' \equiv C \cdot F \cdot (s' + v) \overset{-}{\longrightarrow} C \cdot T' \cdot v$.

Clearly $t \equiv C \cdot T \cdot v \; \mathcal{S}^* \; C \cdot T' \cdot v$.

2. Suppose $A \cdot s \overset{F}{\longrightarrow} T$ for $A : 1 \to 1$ linear and $F : 1 + n \to 1$ linear and deep in 1. By Lemma 25 one of the following holds.

(a) There exists $H : 1 + n \to 1$ such that $T \equiv H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \overset{F}{\longrightarrow} H \cdot (\hat{s} + \mathbf{id}_n)$.

Hence $A \cdot s' \overset{F}{\longrightarrow} H \cdot (s' + \mathbf{id}_n)$.

Clearly $T \equiv H \cdot (s + \mathbf{id}_n) \; [\mathcal{S}^*] \; H \cdot (s' + \mathbf{id}_n)$.

(b) There exist

$$m_{13} \geq 0 \text{ and } m_{12} \geq 0 \text{ and } m_2 \geq 0 \text{ and } m_3 \geq 0$$
$$\text{such that } n = m_3 + m_2$$
$$L_{12} : 1 + m_{12} \to 1 \text{ linear, deep in 1 and 1-separated}$$
$$L_2 : 1 + m_2 \to 1 \text{ linear, deep in argument 1 and 1-separated}$$
$$\hat{T} : m_{13} + m_{12} + m_3 + m_2 \to 1$$
$$v_3 : 0 \to m_{13}$$
$$v_2 : 0 \to m_{12}$$
$$e : 0 \to m_3$$

such that

$$s \xrightarrow{L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (L_{12} + \mathbf{id}_n) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12}+m_3+m_2})} \hat{T}$$
$$F \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$$
$$T \equiv \hat{T} \cdot (v_3 + v_2 + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2})$$
$$A \equiv \mathbf{par}_{1+m_3} \cdot (L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (\mathbf{id}_1 + v_3) + v_2) + e)$$

By $s \sim s'$ there exists $\hat{T}'$ such that $s' \xrightarrow{L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (L_{12} + \mathbf{id}_n) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12}+m_3+m_2})} \hat{T}' \wedge \hat{T} \; [\sim] \; \hat{T}'$.

By Lemma 28 $A \cdot s' \overset{F}{\longrightarrow} \hat{T}' \cdot (v_3 + v_2 + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2})$.

Clearly $T \equiv \hat{T} \cdot (v_3 + v_2 + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \; [\mathcal{S}^*] \; \hat{T}' \cdot (v_3 + v_2 + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2})$.

(c) There exist

$$m_{12} \geq 0 \text{ and } m_2 \geq 0 \text{ and } m_3 \geq 0 \text{ such that } n = m_3 + m_2$$
$$L_{12} : m_{12} \to 1 \text{ linear and deep}$$
$$L_2 : 1 + m_2 \to 1 \text{ linear, deep in argument 1 and 1-separated}$$
$$\hat{T} : m_3 + m_{12} + m_2 \to 1$$
$$v : 0 \to m_{12}$$
$$\hat{a} : 0 \to m_3$$

such that

$$s \xrightarrow{L_2 \cdot (\mathbf{par}_{2+m_3} + \mathbf{id}_{m_2}) \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_{12} + \mathbf{id}_{m_2})} \hat{T}$$
$$F \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$$
$$T \equiv \hat{T} \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \hat{a}) + v + \mathbf{id}_{m_2})$$
$$A \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + L_{12} \cdot v + \hat{a})$$

By $s \sim s'$ there exists $\hat{T}'$ such that $s' \xrightarrow{L_2 \cdot (\mathbf{par}_{2+m_3} + \mathbf{id}_{m_2}) \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_{12} + \mathbf{id}_{m_2})} \hat{T}' \wedge \hat{T} \; [\sim] \; \hat{T}'$.

By Lemma 29 $A \cdot s' \xrightarrow{F} \hat{T}' \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \hat{a}) + v + \mathbf{id}_{m_2})$.

Clearly $T \equiv \hat{T} \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \hat{a}) + v + \mathbf{id}_{m_2}) \; [\mathcal{S}^*] \; \hat{T}' \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \hat{a}) + v + \mathbf{id}_{m_2})$.

3. Suppose $A \cdot s \xrightarrow{F} T$ for $A : 1 \to 1$ linear and $F : 1 + n \to 1$ linear, shallow in 1 and $F \not\equiv \mathbf{id}_1$.

   By Lemma 26 one of the following holds.

   (a) There exists $H : 1 + n \to 1$ such that $T \equiv H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \xrightarrow{F} H \cdot (\hat{s} + \mathbf{id}_n)$.

      Hence $A \cdot s' \xrightarrow{F} H \cdot (s' + \mathbf{id}_n)$.

      Clearly $T \equiv H \cdot (s + \mathbf{id}_n) \; [\mathcal{S}^*] \; H \cdot (s' + \mathbf{id}_n)$.

   (b) There exist

$$m_{13} \geq 0 \text{ and } m_{12} \geq 0 \text{ and } m_2 \geq 0 \text{ and } m_3 \geq 0$$
$$\text{such that } n = m_3 + m_2$$
$$q : 0 \to 1$$
$$L_{12} : 1 + m_{12} \to 1 \text{ linear, deep and 1-separated}$$
$$L_2 : m_2 \to 1 \text{ linear and deep}$$
$$\hat{T} : m_{13} + m_{12} + m_3 + m_2 \to 1$$
$$v_3 : 0 \to m_{13}$$
$$v_2 : 0 \to m_{12}$$
$$e : 0 \to m_3$$

such that

$$s \xrightarrow{\mathbf{par}_{2+m_3} \cdot (L_{12} + \mathbf{id}_{m_3} + L_2) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12}+m_3+m_2})} \hat{T}$$
$$F \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)$$
$$T \equiv \mathbf{par}_2 \cdot (q + \hat{T} \cdot (v_3 + v_2 + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}))$$
$$A \equiv \mathbf{par}_{2+m_3} \cdot (q + L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (\mathbf{id}_1 + v_3) + v_2) + e)$$
$$m_3 = 0 \Rightarrow L_2 \not\equiv \langle 0 \rangle_0$$

By $s \sim s'$ there exists $\hat{T}'$ such that $s' \xrightarrow{\mathbf{par}_{2+m_3} \cdot (L_{12} + \mathbf{id}_{m_3} + L_2) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12}+m_3+m_2})} \hat{T}' \wedge \hat{T} \; [\sim] \; \hat{T}'$.

By Lemma 30 $A \cdot s' \xrightarrow{F} \mathbf{par}_2 \cdot (q + \hat{T}' \cdot (v_3 + v_2 + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}))$.

Clearly $T \equiv \mathbf{par}_2 \cdot (q + \hat{T} \cdot (v_3 + v_2 + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2})) \; [\mathcal{S}^*] \; \mathbf{par}_2 \cdot (q + \hat{T}' \cdot (v_3 + v_2 + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}))$.

   (c) There exist

$$m_{12} \geq 0 \text{ and } m_2 \geq 0 \text{ and } m_3 \geq 0 \text{ such that } n = m_3 + m_2$$
$$a' : 0 \to 1$$
$$L_{12} : m_{12} \to 1 \text{ linear and deep}$$
$$L_2 : m_2 \to 1 \text{ linear and deep}$$
$$\hat{T} : m_3 + m_{12} + m_2 \to 1$$
$$v_2 : 0 \to m_{12}$$
$$a''' : 0 \to m_3$$

such that

$$s \xrightarrow{\mathbf{par}_{3+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_{12} + L_2)} \hat{T}$$
$$F \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)$$
$$T \equiv \mathbf{par}_2 \cdot (a' + \hat{T} \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + a''') + v_2 + \mathbf{id}_{m_2}))$$
$$A \equiv \mathbf{par}_{1+2+m_3} \cdot (\mathbf{id}_1 + a' + L_{12} \cdot v_2 + a''')$$
$$m_3 = 0 \Rightarrow L_2 \not\equiv \langle 0 \rangle_0$$

By $s \sim s'$ there exists $\hat{T}'$ such that $s' \overset{\mathbf{par}_{3+m_3}\cdot(\mathbf{id}_1 + \mathbf{id}_{m_3} + L_{12} + L_2)}{\longrightarrow} \hat{T}' \wedge \hat{T} \, [\sim] \, \hat{T}'$.

By Lemma 31 $A \cdot s' \overset{F}{\longrightarrow} \mathbf{par}_2 \cdot (a' + \hat{T}' \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + a''') + v_2 + \mathbf{id}_{m_2}))$.

Clearly $T \; \equiv \; \mathbf{par}_2 \cdot (a' + \hat{T} \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + a''') + v_2 + \mathbf{id}_{m_2})) \; [\mathcal{S}^*] \; \mathbf{par}_2 \cdot (a' + \hat{T}' \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + a''') + v_2 + \mathbf{id}_{m_2}))$.

Now if

$$r_1 \equiv A_1 \cdot s_1 \; \mathcal{S} \; A_1 \cdot s_2' \equiv A_2 \cdot s_2 \; \mathcal{S} \; \ldots \; \mathcal{S} \; A_{n-1} \cdot s_n'$$

for A_i linear and $s_i \sim s_{i+1}'$, for $i \in 1..n-1$, and $r_1 \overset{F}{\longrightarrow} T_1$ then by the closure of transitions under $\equiv$, and the above, there exists T_n such that $A_{n-1} \cdot s_n' \overset{F}{\longrightarrow} T_n$ and $T_1 \, [(\equiv \mathcal{S})^*] \, T_n$.

□

Remark The definitions allow only rather crude specifications of the set $\mathcal{C}$ of reduction contexts. They ensure that $\mathcal{C}$ has a number of closure properties, which are used in the proof of Lemma 24 (in Appendix C.2). Some reduction semantics require more delicate sets of reduction contexts. For example, for a list cons constructor one might want to allow $\mathrm{cons}(\_, e)$ and $\mathrm{cons}(v, \_)$ where v is taken from some given set of *values*. This would require a non-trivial generalisation of the theory.

Example – CCS synchronization For our CCS fragment the definition gives

$$\alpha.u \mid r \quad \overset{-\mid \bar{\alpha}.\_1}{\longrightarrow} \quad u \mid_{\_1} \mid r$$
$$\bar{\alpha}.u \mid r \quad \overset{-\mid \alpha.\_1}{\longrightarrow} \quad u \mid_{\_1} \mid r$$

together with structurally congruent transitions , i.e. those generated by

$$\frac{s' \equiv s \quad s \overset{F}{\longrightarrow} T \quad T \equiv T' \quad F \equiv F'}{s' \overset{F'}{\longrightarrow} T'}$$

and the reductions.

PROPOSITION 12 *$\sim$ coincides with bisimulation over the labelled transitions of Section 1.*

PROOF Write $\sim_{\mathrm{std}}$ for the standard bisimulation over the labelled transitions of Section 1. To show $\sim_{\mathrm{std}}$ is a bisimulation for the contextual labelled transitions, suppose $P \sim_{\mathrm{std}} P'$ and $P \overset{-\mid \bar{\alpha}.\_1}{\longrightarrow} T$. There must exist u and r such that $P \equiv \alpha.u \mid r$ and $T \equiv u \mid_{\_1} \mid r$, but then $P \overset{\alpha}{\longrightarrow} \equiv u \mid r$, so there exists Q' such that $P' \overset{\alpha}{\longrightarrow} Q' \sim_{\mathrm{std}} u \mid r$. There must then exist u' and r' such that $P' \equiv \alpha.u' \mid r'$ and $Q \equiv u' \mid r'$, hence $P' \overset{-\mid \bar{\alpha}.\_1}{\longrightarrow} u' \mid_{\_1} \mid r'$. Using the fact that $\sim_{\mathrm{std}}$ is a congruence we have $\forall s . \; u \mid s \mid r \sim_{\mathrm{std}} u' \mid s \mid r$ so $T \, [\sim_{\mathrm{std}}] \, u' \mid_{\_1} \mid r'$.

For the converse, suppose $P \sim P'$ and $P \overset{\alpha}{\longrightarrow} Q$. There must exist u and r such that $P \equiv \alpha.u \mid r$ and $Q \equiv u \mid r$, but then $P \overset{-\mid \bar{\alpha}.\_1}{\longrightarrow} u \mid_{\_1} \mid r$, so there exists T' such that $P' \overset{-\mid \bar{\alpha}.\_1}{\longrightarrow} T' \wedge (u \mid_{\_1} \mid r) \, [\sim] \, T'$. There must then exist u' and r' such that $P' \equiv \alpha.u' \mid r'$ and $T' \equiv u' \mid_{\_1} \mid r'$, hence $P' \overset{\alpha}{\longrightarrow} u' \mid r'$. By the definition of $[\,]$ we have $P' \equiv u \mid 0 \mid r \sim u' \mid 0 \mid r'$.

□

The standard transitions coincide (modulo structural congruence) with the contextual labelled transitions with their parameter instantiated by 0. One might look for general conditions on $\mathcal{R}$ under which bisimulation over such 0-instantiated transitions is already a congruence, and coincides with $\sim$.

Example – Ambient movement   The CCS fragment is degenerate in several respects – in the left hand side of the rewrite rule there are no nested non-parallel symbols and no parameters in parallel with any non-0 term, so there are no deep transitions and no partial instantiations. As a less degenerate example we consider a fragment of the Ambient Calculus [CG98] without binding. The signature Σ_{Amb} has unary $m[\,]$ (written outfix), in $m.$, out $m.$ and open $m.$, for all $m \in \mathcal{A}$. Of these only the $m[\,]$ allow reduction. The rewrite rules $\mathcal{R}_{\text{Amb}}$ are

$$
\begin{aligned}
n[\text{in } m._{-1} \mid {}_{-2}] \mid m[_{-3}] &\longrightarrow m[n[_{-1} \mid {}_{-2}] \mid {}_{-3}] \\
m[n[\text{out } m._{-1} \mid {}_{-2}] \mid {}_{-3}] &\longrightarrow n[_{-1} \mid {}_{-2}] \mid m[_{-3}] \\
\text{open } m._{-1} \mid m[_{-2}] &\longrightarrow {}_{-1} \mid {}_{-2}
\end{aligned}
$$

The definition gives the transitions below, together with structurally congruent transitions, permutation instances, and the reductions.

$$
\begin{aligned}
\text{in } m.s \mid r & \xrightarrow{n[-\mid{}_{-1}]\mid m[{}_{-2}]} & m[n[s \mid r \mid {}_{-1}] \mid {}_{-2}] \\
n[\text{in } m.s \mid t] \mid r & \xrightarrow{-\mid m[{}_{-1}]} & m[n[s \mid t] \mid {}_{-1}] \mid r \\
m[s] \mid r & \xrightarrow{n[\text{in } m._{-1}\mid{}_{-2}]\mid -} & m[n[_{-1} \mid {}_{-2}] \mid s] \mid r
\end{aligned}
$$

$$
\begin{aligned}
\text{out } m.s \mid r & \xrightarrow{m[n[-\mid{}_{-1}]\mid{}_{-2}]} & n[s \mid r \mid {}_{-1}] \mid m[{}_{-2}] \\
n[\text{out } m.s \mid t] \mid r & \xrightarrow{m[-\mid{}_{-1}]} & n[s \mid t] \mid m[r \mid {}_{-1}] \\
\text{open } n.s \mid r & \xrightarrow{-\mid n[{}_{-1}]} & s \mid {}_{-1} \mid r \\
n[s] \mid r & \xrightarrow{\text{open } n._{-1}\mid -} & {}_{-1} \mid s \mid r
\end{aligned}
$$

5   Conclusion

We have given general definitions of contextual labelled transitions, and bisimulation congruence results, for three simple classes of reduction semantics. It is preliminary work – the definitions may inform work on particular interesting calculi, but to directly apply the results they must be generalized to more expressive classes of reduction semantics. Several directions suggest themselves.

Higher order rewriting   Functional programming languages can generally be equipped with straightforward definitions of operational congruence, involving quantification over contexts. As discussed in the introduction, in several cases these have been given tractable characterisations in terms of bisimulation. One might generalise the term rewriting case of Section 3 to some notion of higher order rewriting [vR96] equipped with non-trivial sets of reduction contexts, to investigate the extent to which this can be done uniformly.

Name binding   To express calculi with mobile scopes, such as the π-calculus and its descendants, one requires a syntax with name binding, and a structural congruence allowing scope extrusion. Generalising the definitions of Section 4 to the class of all non-higher-order action calculi would take in a number of examples, some of which currently lack satisfactory operational congruences, and should show how the indexed structure of π labelled transitions arises from the rewrite rules and structural congruence.

   Ultimately one would like to treat concurrent functional languages. In particluar cases it has been shown that one can define labelled transitions that give rise to bisimulation congruences, e.g. by Ferreira, Hennessy and Jeffrey for Core CML [FHJ96]. To express the reduction semantics of such languages would require both higher order rules and a rich structural congruence.

Colouring   The definition of labelled transitions in Section 4 is rather intricate – for tractable generalisations, to more expressive settings, one would like a more concise characterisation. A promising approach seems to be to work with *coloured terms,* in which each symbol except $\mid$ and 0 is given a tag from a set of colours. This gives a notion of occurrence of a symbol in a term that is preserved by structural congruence and context application, and hence provides a different way of formalising the idea that the label of a transition $s \xrightarrow{F} T$ must be part of a redex within $F \cdot s$.

Observational congruences   We have focussed on strong bisimulation, which is a very intensional equivalence. It would be interesting to know the extent to which congruence proofs can be given uniformly for equivalences that abstract from branching time, internal reductions etc. More particularly, one would like to know whether Theorem 2 holds without the restriction to right-affine rewrite rules. One can define *barbs* for an arbitrary calculus by $s\downarrow \iff \exists F \not\equiv \mathbf{id}_1, T\,.\quad s \xrightarrow{F} T$, so $s\downarrow$ iff s has some potential interaction with a context. Conditions under which this barbed bisimulation congruence coincides with $\sim$ could provide a useful test of the expressiveness of calculi.

Structural operational semantics   Our definitions of labelled transition relations are not inductive on term structure. Several authors have considered calculi equipped with labelled transitions defined by an SOS in some well-behaved format, e.g. [dS85, BIM95, GV92, GM98, TP97, Ber98]. The relationship between the two is unclear – one would like conditions on rewrite rules that ensure the labelled transitions of Section 4 are definable by a functorial operational semantics [TP97]. Conversely, one would like conditions on an SOS ensuring that it is characterised by a reduction semantics.

A   Proofs for Section 2

For the inclusion of $\sim$ in $\sim_{\text{alt}}$:

PROPOSITION 13   *If $s \sim t$ then $s \sim_{\text{alt}} t$.*

PROOF   We show

$$\mathcal{S} \stackrel{def}{=} \{\, s, s' \mid s \sim s' \,\}$$

is a bisimulation with respect to $\xrightarrow{F}_{\text{alt}}$.

Suppose $s \xrightarrow{F}_{\text{alt}} t$. By definition $F \cdot s \longrightarrow t$, so $F \cdot s \xrightarrow{=} t$. By Lemma 2 one of the following holds:

1. There exists some H such that $t = H \cdot s$ and for any $\hat{s}$ we have $F \cdot \hat{s} \xrightarrow{=} H \cdot \hat{s}$.

   Instantiating, $F \cdot s' \xrightarrow{=} H \cdot s'$ so $F \cdot s' \longrightarrow H \cdot s'$.

   By definition $s' \xrightarrow{F}_{\text{alt}} H \cdot s'$.

   By Proposition 5 $H \cdot s \sim H \cdot s'$.

2. There exist some $\hat{t}$, F_1 and F_2 such that $F = F_1 \cdot F_2$, $s \xrightarrow{F_2} \hat{t}$ and $t = F_1 \cdot \hat{t}$.

   By $s \sim s'$ there exists $\hat{t}'$ such that $s' \xrightarrow{F_2} \hat{t}' \sim \hat{t}$.

   By Lemma 4 $F_2 \cdot s' \xrightarrow{=} \hat{t}'$.

   By the definition of reduction $F_1 \cdot F_2 \cdot s' \xrightarrow{=} F_1 \cdot \hat{t}'$ so $F_1 \cdot F_2 \cdot s' \longrightarrow F_1 \cdot \hat{t}'$.

   By definition $s' \xrightarrow{F_1 \cdot F_2}_{\text{alt}} F_1 \cdot \hat{t}'$.

   By Proposition 5 $F_1 \cdot \hat{t} \sim F_1 \cdot \hat{t}'$.

$\square$

For the example showing the non-inclusion, the terms are $\gamma^n(\alpha)$ and $\gamma^n(\beta)$ for $n \geq 0$. The transitions are

$$
\begin{aligned}
\gamma^n(\alpha) &\xrightarrow{-} \gamma^n(\alpha) \\
\gamma^n(\beta) &\xrightarrow{-} \gamma^n(\beta) \\
\gamma^n(\beta) &\xrightarrow{-} \gamma^{n-1}(\beta) \text{ if } n \geq 1 \\
\beta &\xrightarrow{\gamma(\text{-})} \beta
\end{aligned}
$$

so $\alpha \not\sim \beta$ whereas the alternative transitions are

$$
\begin{aligned}
\gamma^n(\alpha) &\xrightarrow{-}_{\text{alt}} \gamma^n(\alpha) \\
\gamma^n(\beta) &\xrightarrow{-}_{\text{alt}} \gamma^n(\beta) \\
\gamma^n(\beta) &\xrightarrow{-}_{\text{alt}} \gamma^{n-1}(\beta) \text{ if } n \geq 1 \\
\gamma^n(\alpha) &\xrightarrow{\gamma(\text{-})}_{\text{alt}} \gamma^{1+n}(\alpha) \\
\gamma^n(\beta) &\xrightarrow{\gamma(\text{-})}_{\text{alt}} \gamma^{1+n}(\beta) \\
\gamma^n(\beta) &\xrightarrow{\gamma(\text{-})}_{\text{alt}} \gamma^n(\beta)
\end{aligned}
$$

(considering only those from the cut-down label set) so $\alpha \sim_{\text{alt}} \beta$.

B Proofs for Section 3

PROOF (of Lemma 6) The proof is by induction on the structure of A and B.

1. Case $B = \langle \_1 \rangle_1$ and $m = 1$. Taking $\pi_1 = \langle \_1 \rangle_1$, $\pi_2 = \langle \rangle_1$ and $E = A$ we have clause 2.

2. Case $B = \langle \sigma(b_1, \ldots, b_{|\sigma|}) \rangle_m$.

   (a) Case $A = \langle \_1 \rangle_1$. Taking $m_1 = m$, $m_2 = 0$, $\pi_1 = \mathbf{id}_m$, $\pi_2 = \mathbf{id}_0$, $C = \mathbf{id}_1$ and $D = B$ we have clause 1.

   (b) Case $A = \langle \sigma(a_1, \ldots, a_{|\sigma|}) \rangle_1$, $|\sigma| \geq 1$ and $\_1$ occurs only in a_k.
   We have $\langle a_k \rangle_1 : 1 \to 1$ linear.
   Further, by B linear there exist $m_1, \ldots, m_{|\sigma|}$ which sum to m, $B_i : m_i \to 1$ linear for $i \in 1..|\sigma|$, and a partition $\theta_i : m \to m_i$ for $i \in 1..|\sigma|$, such that $\langle b_i \rangle_m = B_i \cdot \theta_i$ for all i. We therefore have

   $$B = \sigma \cdot (B_1 + \ldots + B_{|\sigma|}) \cdot (\theta_1 \oplus \ldots \oplus \theta_{|\sigma|})$$

   (writing σ for $\langle \sigma(\_1, \ldots, \_{|\sigma|}) \rangle_{|\sigma|}$). By the induction hypothesis for $\langle a_k \rangle_1 \cdot a = B_k \cdot (\theta_k \cdot b)$ one of the following cases holds.

   i. (a is not in any component of $(\theta_k \cdot b)$) There exist

   $$\begin{aligned} &m_{k\,1} \text{ and } m_{k\,2} \text{ such that } m_{k\,1} + m_{k\,2} = m_k \\ &\phi_i : m_k \to m_{k\,i} \text{ for } i \in \{1,2\} \text{ a partition} \\ &\hat{C} : 1 + m_{k\,2} \to 1 \text{ linear} \\ &D : m_{k\,1} \to 1 \text{ linear and not the identity} \end{aligned}$$

   such that

   $$\begin{aligned} \langle a_k \rangle_1 &= \hat{C} \cdot (\mathbf{id}_1 + \phi_2 \cdot (\theta_k \cdot b)) \\ a &= D \cdot \phi_1 \cdot (\theta_k \cdot b) \\ B_k &= \hat{C} \cdot (D + \mathbf{id}_{m_{k\,2}}) \cdot (\phi_1 \oplus \phi_2) \end{aligned}$$

   i.e. there are $m_{k\,1}$ components of $(\theta_k \cdot b)$ in a and $m_{k\,2}$ in $\langle a_k \rangle_1$. Taking

   $$\begin{aligned} \pi_1 &= \phi_1 \cdot \theta_k : m \to m_{k1} \\ \pi_2 &= (\mathbf{id}_{m_1 + \ldots + m_{k-1}} + \phi_2 + \mathbf{id}_{m_{k+1} + \ldots + m_{|\sigma|}}) \\ &\quad \cdot (\theta_1 \oplus \ldots \oplus \theta_{|\sigma|}) : m \to m_1 + \ldots + m_{k-1} + m_{k\,2} + m_{k+1} + \ldots + m_{|\sigma|} \\ C &= \sigma \cdot (B_1 + \ldots + B_{k-1} + \hat{C} + B_{k+1} + \ldots + B_{|\sigma|}) \\ &\quad \cdot (\mathbf{perm}_{(m_1 + \ldots + m_{k-1}),1} + \mathbf{id}_{m_{k\,2}} + \mathbf{id}_{m_{k+1} + \ldots + m_{|\sigma|}}) \end{aligned}$$

   we have clause 1.

   ii. (a is in a component of $(\theta_k \cdot b)$) $m_k \geq 1$ and there exist

   $$\begin{aligned} &\phi_1 : m_k \to 1 \text{ and } \phi_2 : m_k \to (m_k - 1) \text{ a partition} \\ &E : 1 \to 1 \text{ linear} \end{aligned}$$

   such that

   $$\begin{aligned} \langle a_k \rangle_1 &= B_k \cdot (\phi_1 \oplus \phi_2)^{-1} \cdot (E + \phi_2 \cdot (\theta_k \cdot b)) \\ E \cdot a &= \phi_1 \cdot (\theta_k \cdot b) \end{aligned}$$

Taking the partition

$$\begin{aligned}\pi_1 &= \phi_1 \cdot \theta_k : m \to 1 \\ \pi_2 &= (\mathbf{id}_{m_1+\ldots+m_{k-1}} + \phi_2 + \mathbf{id}_{m_{k+1}+\ldots+m_{|\sigma|}}) \cdot (\pi_1 \oplus \ldots \oplus \pi_{|\sigma|}) : m \to (m-1)\end{aligned}$$

we have clause 2.

$\square$

PROOF (of Lemma 7) By the definition of labelled transitions

$$\exists \langle m, L, R \rangle \in \mathcal{R}, C : 1 \to 1 \text{ linear}, u : 0 \to m . \quad A \cdot s = C \cdot L \cdot u \wedge C \cdot R \cdot u = t$$

Applying Lemma 1 to $A \cdot s = C \cdot (L \cdot u)$ gives the following cases.

1. ($L \cdot u$ is in s) There exists $B : 1 \to 1$ linear such that $s = B \cdot L \cdot u$ and $A \cdot B = C$.

   Taking $k = 0$, $F = \mathbf{id}_1$, $T = B \cdot R \cdot u$, $D = A$ and $v = \langle \rangle_0$ the second clause holds.

2. (s is properly in $L \cdot u$) There exists $B : 1 \to 1$ linear with $B \neq \_$ such that $B \cdot s = L \cdot u$ and $A = C \cdot B$.

   Applying Lemma 6 to $B \cdot s = L \cdot u$ one of the following hold.

   (a) (s is not in any component of u) There exist

   $$\begin{aligned}&m_1 \text{ and } m_2 \text{ such that } m_1 + m_2 = m \\ &\pi_i : m \to m_i \text{ for } i \in \{1, 2\} \text{ a partition} \\ &F : 1 + m_2 \to 1 \text{ linear} \\ &G : m_1 \to 1 \text{ linear and not the identity}\end{aligned}$$

   such that

   $$\begin{aligned}B &= F \cdot (\mathbf{id}_1 + \pi_2 \cdot u) \\ s &= G \cdot \pi_1 \cdot u \\ L &= F \cdot (G + \mathbf{id}_{m_2}) \cdot (\pi_1 \oplus \pi_2)\end{aligned}$$

   i.e. there are m_1 components of u in s and m_2 in B.
   Taking $k = m_2$, $T = R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{id}_{m_2})$, $D = C$ and $v = \pi_2 \cdot u$ the second clause holds.
   By $B \neq \mathbf{id}_1$ we know $F \neq \mathbf{id}_1$. There is a transition

   $$s \xrightarrow{F} R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{id}_{m_2})$$

   as

   $$\begin{aligned}&\langle m, L, R \rangle \in \mathcal{R} \\ &m_1 \text{ and } m_2 \text{ such that } m_1 + m_2 = m \\ &(\pi_1 \oplus \pi_2) : m \to m \text{ a permutation} \\ &G : m_1 \to 1 \text{ linear and not the identity} \\ &F : 1 + m_2 \to 1 \text{ linear and not the identity} \\ &\pi_1 \cdot u : 0 \to m_1\end{aligned}$$

   and

   $$\begin{aligned}L &= F \cdot (G + \mathbf{id}_{m_2}) \cdot (\pi_1 \oplus \pi_2) \\ s &= G \cdot \pi_1 \cdot u \\ R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{id}_{m_2}) &= R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{id}_{m_2})\end{aligned}$$

(b) (s is in a component of u) $m \geq 1$ and there exist

$$\pi_1 : m \to 1 \text{ and } \pi_2 : m \to (m-1) \text{ a partition}$$
$$F : 1 \to 1 \text{ linear}$$

such that

$$B = L \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (F + \pi_2 \cdot u)$$
$$F \cdot s = \pi_1 \cdot u$$

Taking $H = C \cdot R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (F + \pi_2 \cdot u)$ the first clause holds.

3. (s and $L \cdot u$ are disjoint) There exists $E : 2 \to 1$ linear such that $A = E \cdot (\_ + L \cdot u)$ and $C = E \cdot (s + \_)$.

Taking $H = E \cdot (\_ + R \cdot u)$ the first clause holds.

$\square$

PROOF (of Lemma 8) By the definition of labelled transitions there exist

$$\langle m, L, R \rangle \in \mathcal{R} \text{ with } m \geq n$$
$$\pi : m \to m \text{ a permutation}$$
$$L_1 : (m-n) \to 1 \text{ linear and not the identity}$$
$$u : 0 \to (m-n)$$

such that

$$L = F \cdot (L_1 + \mathbf{id}_n) \cdot \pi$$
$$A \cdot s = L_1 \cdot u$$
$$T = R \cdot \pi^{-1} \cdot (u + \mathbf{id}_n)$$

Let $m_1 = m - n$ and $m_2 = n$. Applying Lemma 6 to $A \cdot s = L_1 \cdot u$ one of the following hold.

1. (s is not in any component of u) There exist

$$m_{11} \text{ and } m_{12} \text{ such that } m_{11} + m_{12} = m_1$$
$$\theta_i : m_1 \to m_{1i} \text{ for } i \in \{1, 2\} \text{ a partition}$$
$$E : 1 + m_{12} \to 1 \text{ linear}$$
$$G : m_{11} \to 1 \text{ linear and not the identity}$$

such that

$$A = E \cdot (\mathbf{id}_1 + \theta_2 \cdot u)$$
$$s = G \cdot \theta_1 \cdot u$$
$$L_1 = E \cdot (G + \mathbf{id}_{m_{12}}) \cdot (\theta_1 \oplus \theta_2)$$

i.e. there are m_{11} components of u in s and m_{12} in A.

Taking $p = m_{12}$, $\hat{T} = R \cdot ((\theta_1 \oplus \theta_2 + \mathbf{id}_{m_2}) \cdot \pi)^{-1} \cdot (\theta_1 \cdot u + \mathbf{id}_{m_{12}} + \mathbf{id}_{m_2})$ and $v = \theta_2 \cdot u$ we have clause 2.

There is a transition

$$G \cdot \theta_1 \cdot u \overset{F \cdot (E + \mathbf{id}_n)}{\longrightarrow} R \cdot ((\theta_1 \oplus \theta_2 + \mathbf{id}_{m_2}) \cdot \pi)^{-1} \cdot (\theta_1 \cdot u + \mathbf{id}_{m_{12}} + \mathbf{id}_{m_2})$$

as

$$\langle m, L, R \rangle \in \mathcal{R}$$
$$m_{11} \text{ and } m_{12} + m_2 \text{ such that } m_{11} + m_{12} + m_2 = m$$
$$((\theta_1 \oplus \theta_2 + \mathbf{id}_{m_2}) \cdot \pi) : m \to m \text{ a permutation}$$
$$G : m_{11} \to 1 \text{ linear and not the identity}$$
$$F \cdot (E + \mathbf{id}_n) : 1 + m_{12} + m_2 \to 1 \text{ linear and not the identity}$$
$$\theta_1 \cdot u : 0 \to m_{11}$$

and

$$
\begin{aligned}
L &= F \cdot (E + \mathbf{id}_n) \cdot (G + \mathbf{id}_{m_{12}+m_2}) \cdot ((\theta_1 \oplus \theta_2 + \mathbf{id}_{m_2}) \cdot \pi) \\
G \cdot \theta_1 \cdot u &= G \cdot \theta_1 \cdot u \\
R \cdot ((\theta_1 \oplus \theta_2 + \mathbf{id}_{m_2}) \cdot \pi)^{-1} \cdot (\theta_1 \cdot u + \mathbf{id}_{m_{12}} + \mathbf{id}_{m_2}) &= R \cdot ((\theta_1 \oplus \theta_2 + \mathbf{id}_{m_2}) \cdot \pi)^{-1} \cdot (\theta_1 \cdot u + \mathbf{id}_{m_{12}+m_2})
\end{aligned}
$$

We also have to check

$$
\begin{aligned}
T &= R \cdot ((\theta_1 \oplus \theta_2 + \mathbf{id}_{m_2}) \cdot \pi)^{-1} \cdot (\theta_1 \cdot u + \mathbf{id}_{m_{12}} + \mathbf{id}_{m_2}) \cdot (\theta_2 \cdot u \oplus \mathbf{id}_{m_2}) \\
A &= E \cdot (\mathbf{id}_1 + \theta_2 \cdot u)
\end{aligned}
$$

2.   (s is in a component of u) $m_1 \geq 1$ and there exist

$$
\begin{aligned}
&\theta_1 : m_1 \to 1 \text{ and } \theta_2 : m_1 \to (m_1 - 1) \text{ a partition} \\
&J : 1 \to 1 \text{ linear}
\end{aligned}
$$

such that

$$
\begin{aligned}
A &= L_1 \cdot (\theta_1 \oplus \theta_2)^{-1} \cdot (J + \theta_2 \cdot u) \\
J \cdot s &= \theta_1 \cdot u
\end{aligned}
$$

Taking $H = R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J + \theta_2 \cdot u) + \mathbf{id}_{m_2})$ we have clause 1.
There is a transition

$$
A \cdot \hat{s} \xrightarrow{F} R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J + \theta_2 \cdot u) + \mathbf{id}_{m_2}) \cdot (\hat{s} + \mathbf{id}_{m_2})
$$

as

$$
\begin{aligned}
&\langle m, L, R \rangle \in \mathcal{R} \\
&m_1 \text{ and } m_2 \text{ such that } m_1 + m_2 = m \\
&\pi : m \to m \text{ a permutation} \\
&L_1 : m_1 \to 1 \text{ linear and not the identity} \\
&F : 1 + m_2 \to 1 \text{ linear and not the identity} \\
&(\theta_1 \oplus \theta_2)^{-1} \cdot (J \cdot \hat{s} + \theta_2 \cdot u) : 0 \to m_1
\end{aligned}
$$

and

$$
\begin{aligned}
L &= F \cdot (L_1 + \mathbf{id}_{m_2}) \cdot \pi \\
A \cdot \hat{s} &= L_1 \cdot (\theta_1 \oplus \theta_2)^{-1} \cdot (J \cdot \hat{s} + \theta_2 \cdot u) \\
R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J + \theta_2 \cdot u) + \mathbf{id}_{m_2}) \cdot (\hat{s} + \mathbf{id}_{m_2}) &= R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J \cdot \hat{s} + \theta_2 \cdot u) + \mathbf{id}_{m_2})
\end{aligned}
$$

We also have to check

$$
T = R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J + \theta_2 \cdot u) + \mathbf{id}_{m_2}) \cdot (s + \mathbf{id}_{m_2})
$$

$\square$

PROOF (of Lemma 9) There are three cases. Firstly, suppose $p + n = 0$ and $C \cdot (E + \mathbf{id}_n) = \mathbf{id}_1$. It must then be that $C = \mathbf{id}_1$ and $E = \mathbf{id}_1$, so the conclusion is trivially true. Otherwise, by the definition of labelled transitions there exist

$$
\begin{aligned}
&\langle m, L, R \rangle \in \mathcal{R} \text{ with } m \geq (p + n) \\
&\pi : m \to m \text{ a permutation} \\
&L_1 : (m - (p + n)) \to 1 \text{ linear and not the identity} \\
&u : 0 \to (m - (p + n))
\end{aligned}
$$

such that

$$
\begin{aligned}
L &= C \cdot (E + \mathbf{id}_n) \cdot (L_1 + \mathbf{id}_{(p+n)}) \cdot \pi \\
s &= L_1 \cdot u \\
T &= R \cdot \pi^{-1} \cdot (u + \mathbf{id}_{(p+n)})
\end{aligned}
$$

Consider arbitrary $v : 0 \to p$.

1. Case $C = \mathbf{id}_1$. Here $n = 0$ so

$$
\begin{aligned}
E \cdot (s + v) \quad &= \quad L \cdot \pi^{-1} \cdot (u + v) \\
&\longrightarrow \quad R \cdot \pi_2^{-1} \cdot (u + v) \\
&= \quad T \cdot v
\end{aligned}
$$

2. Case $C \neq \mathbf{id}_1$

   There is a transition

$$
E \cdot (s + v) \xrightarrow{C} T \cdot (v + \mathbf{id}_n)
$$

   as

$$
\begin{aligned}
&\langle m, L, R \rangle \in \mathcal{R} \\
&(m - n) \text{ and } n \text{ such that } (m - n) + n = m \\
&\pi : m \to m \text{ a permutation} \\
&E \cdot (L_1 + \mathbf{id}_p) : (m - n) \to 1 \text{ linear and not the identity} \\
&C : 1 + n \to 1 \text{ linear and not the identity} \\
&(u + v) : 0 \to (m - n)
\end{aligned}
$$

   and

$$
\begin{aligned}
L \quad &= \quad C \cdot (E \cdot (L_1 + \mathbf{id}_p) + \mathbf{id}_n) \cdot \pi \\
E \cdot (s + v) \quad &= \quad E \cdot (L_1 + \mathbf{id}_p) \cdot (u + v) \\
T \cdot (v + \mathbf{id}_n) \quad &= \quad R \cdot \pi^{-1} \cdot ((u + v) + \mathbf{id}_n)
\end{aligned}
$$

$\square$

PROOF (of Proposition 10) We check $\sim_{\mathcal{R}}$ is a bisimulation for the transitions $\xrightarrow{F}_{\mathrm{Cl}(\mathcal{R})}$. Consider $s \sim_{\mathcal{R}} s'$.

1. Suppose $s \overset{=}{\to}_{\mathrm{Cl}(\mathcal{R})} t$. Trivially $s \overset{=}{\to}_{\mathcal{R}} t$. By $s \sim_{\mathcal{R}} s'$ there exists t' such that $s' \overset{=}{\to}_{\mathcal{R}} t'$ and $t \sim_{\mathcal{R}} t'$. Trivially $s' \overset{=}{\to}_{\mathrm{Cl}(\mathcal{R})} t'$.

2. Suppose $s \xrightarrow{F}_{\mathrm{Cl}(\mathcal{R})} t$ and $F \neq \mathbf{id}_1$. By definition there exist $\langle m, L, R \rangle \in \mathcal{R}$ and $v : 0 \to m$ such that $F \cdot s = L \cdot v$ and $R \cdot v = t$. Applying Lemma 6 one of the following hold.

   (a) (s is not in any component of v) There exist

$$
\begin{aligned}
&m_1 \text{ and } m_2 \text{ such that } m_1 + m_2 = m \\
&\pi_i : m \to m_i \text{ for } i \in \{1, 2\} \text{ a partition} \\
&C : 1 + m_2 \to 1 \text{ linear} \\
&D : m_1 \to 1 \text{ linear and not the identity}
\end{aligned}
$$

   such that

$$
\begin{aligned}
F \quad &= \quad C \cdot (\mathbf{id}_1 + \pi_2 \cdot v) \\
s \quad &= \quad D \cdot \pi_1 \cdot v \\
L \quad &= \quad C \cdot (D + \mathbf{id}_{m_2}) \cdot (\pi_1 \oplus \pi_2)
\end{aligned}
$$

   i.e. there are m_1 components of v in s and m_2 in F.

   Here $s \xrightarrow{C}_{\mathcal{R}} R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot v + \mathbf{id}_{m_2})$.

   By $s \sim_{\mathcal{R}} s'$ there exists T' such that $s' \xrightarrow{C}_{\mathcal{R}} T'$ and $R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot v + \mathbf{id}_{m_2}) \, [\sim_{\mathcal{R}}] \, T'$.

   By the definition of transitions there exist

$$
\begin{aligned}
&\langle m', L', R' \rangle \in \mathcal{R} \text{ with } m' \geq m_2 \\
&\phi : m' \to m' \text{ a permutation} \\
&L_1' : (m' - m_2) \to 1 \text{ linear and not the identity} \\
&u' : 0 \to (m' - m_2)
\end{aligned}
$$

such that

$$
\begin{aligned}
L' &= C \cdot (L_1' + \mathbf{id}_{m_2}) \cdot \phi \\
s' &= L_1' \cdot u' \\
T' &= R' \cdot \phi^{-1} \cdot (u' + \mathbf{id}_{m_2})
\end{aligned}
$$

$$
\begin{aligned}
F \cdot s' &= C \cdot (s' + \pi_2 \cdot v) \\
&= C \cdot (L_1' \cdot u' + \pi_2 \cdot v) \\
&= C \cdot (L_1' + \mathbf{id}_{m_2}) \cdot \phi \cdot \phi^{-1} \cdot (u' + \pi_2 \cdot v) \\
&= L' \cdot \phi^{-1} \cdot (u' + \pi_2 \cdot v)
\end{aligned}
$$

so $s' \xrightarrow{F}_{\mathrm{Cl}(\mathcal{R})} R' \cdot \phi^{-1} \cdot (u' + \pi_2 \cdot v) = T' \cdot \pi_2 \cdot v$.

By the definition of $[\ ]$ we have $t = R \cdot v = R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot v + \mathbf{id}_{m_2}) \cdot \pi_2 \cdot v \sim_{\mathcal{R}} T' \cdot \pi_2 \cdot v$.

(b) (s is in a component of v) $m \geq 1$ and there exist

$$
\begin{aligned}
&\pi_1 : m \to 1 \text{ and } \pi_2 : m \to (m-1) \text{ a partition} \\
&E : 1 \to 1 \text{ linear}
\end{aligned}
$$

such that

$$
\begin{aligned}
F &= L \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot v) \\
E \cdot s &= \pi_1 \cdot v
\end{aligned}
$$

Here $t = R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot v) \cdot s$ and $s' \xrightarrow{F}_{\mathrm{Cl}(\mathcal{R})} R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot v) \cdot s'$. By Theorem 1 $R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot v) \cdot s \sim_{\mathcal{R}} R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot v) \cdot s'$.

$\square$

PROOF (of Theorem 2) First note that if the rewrite rules $\mathcal{R}$ are right-affine then the conclusions of Lemmas 7 and 8 can be strengthened to require H affine. We show that $\mathcal{S} \cup \{ s, s \mid s : 0 \to 1 \}$, where

$$
\mathcal{S} \stackrel{def}{=} \{ A \cdot s, A \cdot s' \mid s \approx s' \wedge A : 1 \to 1 \text{ linear} \}
$$

is a bisimulation of the form specified. Consider $A : 1 \to 1$ linear and $s \approx s'$. We show that if $A \cdot s \xrightarrow{\underline{\quad}} t$ then there exists t' such that $A \cdot s' \xrightarrow{\underline{\quad}}^* t'$ and $t \mathcal{S} t'$ or $t = t'$. Moreover, if $A \cdot s \xrightarrow{F} T$ for $F \neq \mathbf{id}_1$ then there exists T' such that $A \cdot s' \xrightarrow{\underline{\quad}}^* \xrightarrow{F} T'$ and $T [\mathcal{S}] T'$ or $T [=] T'$.

1. Suppose $A \cdot s \xrightarrow{\underline{\quad}} t$.

   By Lemma 7 one of the following holds:

   (a) There exists some $H : 1 \to 1$ such that $t = H \cdot s$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \xrightarrow{\underline{\quad}} H \cdot \hat{s}$. Moreover, H is affine.
   Hence $A \cdot s' \xrightarrow{\underline{\quad}} H \cdot s'$.
   If H is linear then clearly $t = H \cdot s \mathcal{S} H \cdot s'$, otherwise H does not use its argument so $t = H \cdot s = H \cdot s'$.

   (b) There exist

   $$
   \begin{aligned}
   &k \geq 0 \\
   &F : 1 + k \to 1 \text{ linear} \\
   &T : k \to 1 \\
   &D : 1 \to 1 \text{ linear} \\
   &v : 0 \to k
   \end{aligned}
   $$

   such that $s \xrightarrow{F} T$, $A = D \cdot F \cdot (\mathbf{id}_1 + v)$ and $t = D \cdot T \cdot v$.

i. Case $F = \mathbf{id}_1$.

By $s \approx s'$ there exists T' such that $s' \dashrightarrow^* T' \wedge T \approx T'$.

By the definition of reduction $A \cdot s' \dashrightarrow^* A \cdot T'$.

Clearly $t = A \cdot T \; \mathcal{S} \; A \cdot T'$.

ii. Case $F \neq \mathbf{id}_1$.

By $s \approx s'$ there exist s'' and T' such that $s' \dashrightarrow^* s'' \xrightarrow{F} T' \wedge T \approx T'$. By Lemma 9 $F \cdot (s'' + v) \dashrightarrow T' \cdot v$.

By the definition of reduction $A \cdot s' = D \cdot F \cdot (s' + v) \dashrightarrow^* D \cdot F \cdot (s'' + v) \dashrightarrow D \cdot T' \cdot v$.

Clearly $t = D \cdot T \cdot v \; \mathcal{S} \; D \cdot T' \cdot v$.

2. Suppose $A \cdot s \xrightarrow{F} T$ for $F : 1 + n \to 1$ linear and $F \neq \mathbf{id}_1$.

   By Lemma 8 one of the following holds.

   (a) There exists $H : 1 + n \to 1$ such that $T = H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \xrightarrow{F} H \cdot (\hat{s} + \mathbf{id}_n)$.

   Moreover, H is affine.

   Hence $A \cdot s' \xrightarrow{F} H \cdot (s' + \mathbf{id}_n)$.

   If H is linear in its first argument then $T = H \cdot (s + \mathbf{id}_n) \; [\mathcal{S}] \; H \cdot (s' + \mathbf{id}_n)$, otherwise H does not use its argument so $T = H \cdot (s + \mathbf{id}_n) = H \cdot (s' + \mathbf{id}_n)$ so $T \; [=] \; H \cdot (s' + \mathbf{id}_n)$.

   (b) There exist

   $$
   \begin{aligned}
   & p \geq 0 \\
   & E : 1 + p \to 1 \text{ linear} \\
   & \hat{T} : p + n \to 1 \\
   & v : 0 \to p
   \end{aligned}
   $$

   such that $s \xrightarrow{F \cdot (E + \mathbf{id}_n)} \hat{T}$, $T = \hat{T} \cdot (v + \mathbf{id}_n)$ and $A = E \cdot (\mathbf{id}_1 + v)$.

   By $s \approx s'$ there exist s'' and $\hat{T}'$ such that $s' \dashrightarrow^* s'' \xrightarrow{F \cdot (E + \mathbf{id}_n)} \hat{T}' \wedge \hat{T} \; [\approx] \; \hat{T}'$.

   By the definition of reductions $A \cdot s' \dashrightarrow^* A \cdot s''$.

   By Lemma 9 $A \cdot s'' = E \cdot (s'' + v) \xrightarrow{F} \hat{T}' \cdot (v + \mathbf{id}_n)$.

   Clearly $T = \hat{T} \cdot (v + \mathbf{id}_n) \; [\mathcal{S}] \; \hat{T}' \cdot (v + \mathbf{id}_n)$.

   $\square$

C   Proofs for Section 4

This appendix contains the lemmas required for the main congruence result of Section 4. Their statements, and the definitions of labelled transitions, involve rather lengthy predicates, which have been instantiated by extensive use of Latex macros. This renders several classes of error less likely, but does make the proof appear disproportionally complex, with many vacuous proof obligations stated explicitly.

C.1   Dissection Lemmas

This subsection contains the proof of the main dissection lemma (Lemma 11), together with the statements of some auxiliary simple dissection results, most of which are asserted without proofs.

LEMMA 14 *If $B : m \to 1$ linear then there exist m_1, m_3, $\pi_1 : m \to m_1$ and $\pi_3 : m \to m_3$ a partition, and $B' : m_1 \to 1$ linear and deep, such that $m = m_1 + m_3$ and $B \equiv \mathbf{par}_{1+m_3} \cdot (B' + \mathbf{id}_{m_3}) \cdot (\pi_1 \oplus \pi_3)$.*

LEMMA 15 *If $C : 1 + m \to 1$ linear then there exist m_1, m_2, $\pi_1 : m \to m_1$ and $\pi_2 : m \to m_2$ a partition, and $C' : (1 + m_2) \to 1$ linear and 1-separated, such that $m = m_1 + m_2$ and $C \equiv C' \cdot (\mathbf{par}_{1+m_1} + \mathbf{id}_{m_2}) \cdot (\mathbf{id}_1 + \pi_1 \oplus \pi_2)$.*

LEMMA 16 *If $B : m \to 1$ is linear for $m \geq 0$ then there exist $n \in 1..m$, $\hat{m}_i \geq 1$ for $i \in 1..n$ summing to m, $\theta_i : m \to \hat{m}_i$ for $i \in 1..n$ a partition, $B_i : \hat{m}_i \to 1$ for $i \in 1..n$ linear and shallow, and $B' : n \to 1$ linear and clean, such that $B \equiv B' \cdot (B_1 + \ldots + B_n) \cdot (\theta_1 \oplus \ldots \oplus \theta_n)$.*

LEMMA 17 *If $m \geq 0$, $B : m \to 1$ is linear and clean, $b : 0 \to m$, and $B \cdot b \equiv c$, then there exist $B' : m \to 1$ linear and $b' : 0 \to m$ such that $B \equiv B'$, $b \equiv b'$ and $c = B' \cdot b'$.*

LEMMA 18 *If $m \geq 0$,*

$$\begin{array}{ll} A : 1 \to 1 & B : m \to 1 \\ a : 0 \to 1 & b : 0 \to m \end{array}$$

with A and B linear, and $A \cdot a = B \cdot b$, then one of the clauses of the conclusion of Lemma 11 holds.

PROOF By Lemma 6 one of the following holds.

1. (a is not in any component of b) There exist

    $$\begin{array}{l} n_1 \text{ and } n_2 \text{ such that } n_1 + n_2 = m \\ \theta_i : m \to n_i \text{ for } i \in \{1, 2\} \text{ a partition} \\ \hat{C} : 1 + n_2 \to 1 \text{ linear} \\ \hat{D} : n_1 \to 1 \text{ linear and not the identity} \end{array}$$

    such that

    $$\begin{array}{rcl} A & = & \hat{C} \cdot (\mathbf{id}_1 + \theta_2 \cdot b) \\ a & = & \hat{D} \cdot \theta_1 \cdot b \\ B & = & \hat{C} \cdot (\hat{D} + \mathbf{id}_{n_2}) \cdot (\theta_1 \oplus \theta_2) \end{array}$$

    i.e. there are n_1 components of b in a and n_2 in A.

    By Lemma 15 for $\hat{C}$ there exist m_{32}, m_2, $\phi_{32} : n_2 \to m_{32}$ and $\phi_2 : n_2 \to m_2$ a partition, and $C : (1 + m_2) \to 1$ linear and 1-separated, such that $n_2 = m_{32} + m_2$ and $\hat{C} \equiv C \cdot (\mathbf{par}_{1+m_{32}} + \mathbf{id}_{m_2}) \cdot (\mathbf{id}_1 + \phi_{32} \oplus \phi_2)$.

By Lemma 14 for $\hat{D}$ there exist m_1, m_{31}, $\phi_1 : n_1 \to m_1$ and $\phi_{31} : n_1 \to m_{31}$ a partition, and $D : m_1 \to 1$ linear and deep, such that $n_1 = m_1 + m_{31}$ and $\hat{D} \equiv \mathbf{par}_{1+m_{31}} \cdot (D + \mathbf{id}_{m_{31}}) \cdot (\phi_1 \oplus \phi_{31})$.

Taking $m_3 = m_{31} + m_{32}$, $\pi_1 = \phi_1 \cdot \theta_1$, $\pi_3 = (\phi_{31} \cdot \theta_1) \oplus (\phi_{32} \cdot \theta_2)$, $\pi_2 = \phi_2 \cdot \theta_2$, $e_1 = \phi_{31} \cdot \theta_1 \cdot b + 0_{m_{32}}$, $e_2 = 0_{m_{31}} + \phi_{32} \cdot \theta_2 \cdot b$ we have clause 1.

2. (a is in a component of b) $m \geq 1$ and there exist

$$\theta_1 : m \to 1 \text{ and } \theta_2 : m \to (m-1) \text{ a partition}$$
$$\hat{E} : 1 \to 1 \text{ linear}$$

such that

$$
\begin{aligned}
A &= B \cdot (\theta_1 \oplus \theta_2)^{-1} \cdot (\hat{E} + \theta_2 \cdot b) \\
\hat{E} \cdot a &= \theta_1 \cdot b
\end{aligned}
$$

(a) Case $\hat{E}$ deep.

Putting $\pi_1 = \theta_1$, $\pi_2 = \theta_2$ and $E = \hat{E}$ we have clause 2.

(b) Case $\hat{E}$ shallow.

By Lemma 15 for $B \cdot (\theta_1 \oplus \theta_2)^{-1}$ there exist $\hat{m}_3$, m_2, $\phi_3 : (m-1) \to \hat{m}_3$ and $\phi_2 : (m-1) \to m_2$ a partition, and $C : (1 + m_2) \to 1$ linear and 1-separated, such that $(m-1) = \hat{m}_3 + m_2$ and $B \cdot (\theta_1 \oplus \theta_2)^{-1} \equiv C \cdot (\mathbf{par}_{1+\hat{m}_3} + \mathbf{id}_{m_2}) \cdot (\mathbf{id}_1 + \phi_3 \oplus \phi_2)$.

Taking $m_1 = 0$, $m_3 = 1 + \hat{m}_3$, $\pi_1 = \langle\rangle_m$, $\pi_3 = \theta_1 \oplus (\phi_3 \cdot \theta_2)$, $\pi_2 = \phi_2 \cdot \theta_2$, $D = \langle 0 \rangle_0$, $e_1 = a + 0_{\hat{m}_3}$, and $e_2 = \hat{E} \cdot 0 + \phi_3 \cdot \theta_2 \cdot b$, we have clause 1.

$\square$

PROOF (of Lemma 11) The proof is by induction on the derivations of structural congruence. We show that if $A \cdot a \equiv B \cdot b$ or $B \cdot b \equiv A \cdot a$ then one of the clauses of the conclusion holds. We first consider some degenerate cases:

Case $m = 0$.

Taking $m_1 = 0$, $m_2 = 0$, $m_3 = 0$, $\pi_1 = \langle\rangle_0$, $\pi_2 = \langle\rangle_0$, $\pi_3 = \langle\rangle_0$, $C = A$, $D = a$, $e_1 = \langle\rangle_0$, $e_2 = \langle\rangle_0$, we have clause 1.

Case $A = \mathbf{id}_1$.

By Lemma 14 there exist m_1, m_3, $\pi_1 : m \to m_1$ and $\pi_3 : m \to m_3$ a partition, and $D : m_1 \to 1$ linear and deep, such that $m = m_1 + m_3$ and $B \equiv \mathbf{par}_{1+m_3} \cdot (D + \mathbf{id}_{m_3}) \cdot (\pi_1 \oplus \pi_3)$.

Taking $m_2 = 0$, $C = \mathbf{id}_1$, $\pi_2 = \langle\rangle_m : m \to m_2$, $e_1 = \pi_3 \cdot b$ and $e_2 = 0_{m_3} : 0 \to m_3$ we have clause 1.

Case $B = \mathbf{id}_1$.

Case A shallow. There exists $e_2 : 0 \to 1$ such that $A \equiv \_ \mid e_2$. Taking $m_1 = 0$, $m_2 = 0$, $m_3 = 1$, $\pi_1 = \langle\rangle_1$, $\pi_2 = \langle\rangle_1$, $\pi_3 = \langle_{\_1}\rangle_1$, $e_1 = a$, $C = \mathbf{id}_1$ and $D = \langle 0 \rangle_0$ we have clause 1.

Case A deep. Taking $\pi_1 = \langle_{\_1}\rangle_1$, $\pi_2 = \langle\rangle_1$ and $E = A$ we have clause 2.

Now suppose $m \geq 1$, $A \neq \mathbf{id}_1$ and $B \neq \mathbf{id}_1$. Consider the last rule used in the derivation of $A \cdot a \equiv B \cdot b$ or $B \cdot b \equiv A \cdot a$.

Identity 1. $A \cdot a = \langle c \rangle_0$ and $B \cdot b = \langle c \mid 0 \rangle_0$.

By $B \not\equiv \mathbf{id}_1$ we know that one of the following holds.

(a) There exists $B' : m \to 1$ linear such that $B = \mathbf{par} \cdot (B' + \langle 0 \rangle_0)$ and $B' \cdot b = \langle c \rangle_0$.
We have $A \cdot a = B' \cdot b$, so by Lemma 18 one of the clauses of the conclusion holds for A, a, B', b. Here $B \equiv B'$, however, so the same clause holds for A, a, B, b.

(b) There exist $\theta_1 : m \to (m-1)$ and $\theta_2 : m \to 1$ a partition, and $B' : m-1 \to 1$ linear, such that $B = \mathbf{par} \cdot (B' + \mathbf{id}_1) \cdot (\theta_1 \oplus \theta_2)$, $B' \cdot \theta_1 \cdot b = \langle c \rangle_0$ and $\theta_2 \cdot b = \langle 0 \rangle_0$.
We have $A \cdot a = B' \cdot (\theta_1 \cdot b)$ so by Lemma 18 one of the following hold

   i. (a is not deeply in any component of $\theta_1 \cdot b$) There exist

$$m_1, \hat{m}_2 \text{ and } \hat{m}_3 \text{ such that } m_1 + \hat{m}_2 + \hat{m}_3 = (m-1)$$
$$\phi_1 : (m-1) \to m_1, \ \phi_2 : (m-1) \to \hat{m}_2 \text{ and } \phi_3 : (m-1) \to \hat{m}_3 \text{ a partition}$$
$$\hat{C} : 1 + \hat{m}_2 \to 1 \text{ linear and 1-separated}$$
$$D : m_1 \to 1 \text{ linear and deep}$$
$$\hat{e}_1 : 0 \to \hat{m}_3$$
$$\hat{e}_2 : 0 \to \hat{m}_3$$

such that

$$
\begin{aligned}
A &\equiv \hat{C} \cdot (\mathbf{par}_{1+\hat{m}_3} \cdot (\mathbf{id}_1 + \hat{e}_2) + \phi_2 \cdot \theta_1 \cdot b) \\
a &\equiv \mathbf{par}_{1+\hat{m}_3} \cdot (D \cdot \phi_1 \cdot \theta_1 \cdot b + \hat{e}_1) \\
B' &\equiv \hat{C} \cdot (\mathbf{par}_{1+\hat{m}_3} \cdot (D + \mathbf{id}_{\hat{m}_3}) + \mathbf{id}_{\hat{m}_2}) \cdot (\phi_1 \oplus \phi_3 \oplus \phi_2) \\
\phi_3 \cdot \theta_1 \cdot b &\equiv \mathbf{ppar}_{\hat{m}_3} \cdot (\hat{e}_1 + \hat{e}_2)
\end{aligned}
$$

There are m_1 of the $\theta_1 \cdot b$ in a, $\hat{m}_2$ of the $\theta_1 \cdot b$ in A and $\hat{m}_3$ of the $\theta_1 \cdot b$ potentially overlapping A and a. The latter are split into $\hat{e}_1$, in a, and $\hat{e}_2$, in A.

    A. Case $\hat{C}$ deep in 1.
Taking $m_2 = \hat{m}_2 + 1$, $m_3 = \hat{m}_3$, $\pi_1 = \phi_1 \cdot \theta_1$, $\pi_3 = \phi_3 \cdot \theta_1$, $\pi_2 = \phi_2 \cdot \theta_1 \oplus \theta_2$, $C = \mathbf{par} \cdot (\hat{C} + \mathbf{id}_1)$, $e_1 = \hat{e}_1$, and $e_2 = \hat{e}_2$, we have clause 1.

    B. Case $\hat{C}$ shallow in 1.
Taking $m_2 = \hat{m}_2$, $m_3 = \hat{m}_3 + 1$, $\pi_1 = \phi_1 \cdot \theta_1$, $\pi_3 = \phi_3 \cdot \theta_1 \oplus \theta_2$, $\pi_2 = \phi_2 \cdot \theta_1$, $C = \hat{C}$, $e_1 = \hat{e}_1 + \langle 0 \rangle_0$, and $e_2 = \hat{e}_2 + \langle 0 \rangle_0$, we have clause 1.

  ii. (a is deeply in a component of $\theta_1 \cdot b$) $(m-1) \geq 1$ and there exist

$$\phi_1 : (m-1) \to 1 \text{ and } \phi_2 : (m-1) \to ((m-1)-1) \text{ a partition}$$
$$E : 1 \to 1 \text{ linear and deep}$$

such that

$$
\begin{aligned}
A &\equiv B' \cdot (\phi_1 \oplus \phi_2)^{-1} \cdot (E + \phi_2 \cdot \theta_1 \cdot b) \\
E \cdot a &\equiv \phi_1 \cdot \theta_1 \cdot b
\end{aligned}
$$

Taking $\pi_1 = \phi_1 \cdot \theta_1$ and $\pi_2 = \phi_2 \cdot \theta_1 \oplus \theta_2$ we have clause 2.

2. $A \cdot a = \langle c \mid 0 \rangle_0$ and $B \cdot b = \langle c \rangle_0$.
By $A \not\equiv \mathbf{id}_1$ we know that one of the following holds.

(a) There exists $A' : 1 \to 1$ linear such that $A = \mathbf{par} \cdot (A' + \langle 0 \rangle_0)$ and $A' \cdot a = \langle c \rangle_0$.
We have $A' \cdot a = B \cdot b$, so by Lemma 18 one of the clauses of the conclusion holds for A', a, B, b. Here $A \equiv A'$, however, so the same clause holds for A, a, B, b.

(b) $A = \mathbf{par} \cdot (c + \mathbf{id}_1)$ and $a = \langle 0 \rangle_0$.
By Lemma 14 for B there exist m_2, m_3, $\pi_2 : m \to m_2$ and $\pi_3 : m \to m_3$ a partition, and $B' : m_2 \to 1$ linear and deep, such that $m = m_2 + m_3$ and $B \equiv \mathbf{par}_{1+m_3} \cdot (B' + \mathbf{id}_{m_3}) \cdot (\pi_2 \oplus \pi_3)$.
Taking $m_1 = 0$, $\pi_1 = \langle \rangle_m$, $C = \mathbf{par}_2 \cdot (\mathbf{id}_1 + B')$, $D = \langle 0 \rangle_0$, $e_1 = 0_{m_3}$, and $e_2 = \pi_3 \cdot b$, we have clause 1.

Commutativity We have $A \cdot a = \langle c \,|\, d \rangle_0$ and $B \cdot b = \langle d \,|\, c \rangle_0$.

By $A \neq \mathbf{id}_1$ there exist $A_2 : 0 \to 1$ and $A_1 : 1 \to 1$ linear (the symmetric case will be similar) such that $A = \mathbf{par} \cdot (A_2 + A_1)$.

By $B \neq \mathbf{id}_1$ there exist $\hat{m}_1$ and $\hat{m}_2$ which sum to m, $B_i : \hat{m}_i \to 1$ linear for $i \in 1..2$, and a partition $\theta_i : m \to \hat{m}_i$ for $i \in 1..2$, such that

$$B = \mathbf{par} \cdot (B_1 + B_2) \cdot (\theta_1 \oplus \theta_2)$$

We then have $A_1 \cdot a = B_1 \cdot \theta_1 \cdot b$ and $A_2 = B_2 \cdot \theta_2 \cdot b$. Applying Lemma 18 to $A_1 \cdot a = B_1 \cdot \theta_1 \cdot b$ gives one of the following. The details are then exactly as in the **Par-Cong** case below.

1. (a is not deeply in any component of $\theta_1 \cdot b$) There exist

   $\hat{m}_{11}, \hat{m}_{12}$ and $\hat{m}_{13}$ such that $\hat{m}_{11} + \hat{m}_{12} + \hat{m}_{13} = \hat{m}_1$
   $\hat{\pi}_1 : \hat{m}_1 \to \hat{m}_{11}$, $\hat{\pi}_2 : \hat{m}_1 \to \hat{m}_{12}$ and $\hat{\pi}_3 : \hat{m}_1 \to \hat{m}_{13}$ a partition
   $\hat{C} : 1 + \hat{m}_{12} \to 1$ linear and 1-separated
   $D : \hat{m}_{11} \to 1$ linear and deep
   $\hat{e}_1 : 0 \to \hat{m}_{13}$
   $\hat{e}_2 : 0 \to \hat{m}_{13}$

   such that

   $$
   \begin{aligned}
   A_1 &\equiv \hat{C} \cdot (\mathbf{par}_{1+\hat{m}_{13}} \cdot (\mathbf{id}_1 + \hat{e}_2) + \hat{\pi}_2 \cdot \theta_1 \cdot b) \\
   a &\equiv \mathbf{par}_{1+\hat{m}_{13}} \cdot (D \cdot \hat{\pi}_1 \cdot \theta_1 \cdot b + \hat{e}_1) \\
   B_1 &\equiv \hat{C} \cdot (\mathbf{par}_{1+\hat{m}_{13}} \cdot (D + \mathbf{id}_{\hat{m}_{13}}) + \mathbf{id}_{\hat{m}_{12}}) \cdot (\hat{\pi}_1 \oplus \hat{\pi}_3 \oplus \hat{\pi}_2) \\
   \hat{\pi}_3 \cdot \theta_1 \cdot b &\equiv \mathbf{ppar}_{\hat{m}_{13}} \cdot (\hat{e}_1 + \hat{e}_2)
   \end{aligned}
   $$

   There are $\hat{m}_{11}$ of the $\theta_1 \cdot b$ in a, $\hat{m}_{12}$ of the $\theta_1 \cdot b$ in A_1 and $\hat{m}_{13}$ of the $\theta_1 \cdot b$ potentially overlapping A_1 and a. The latter are split into $\hat{e}_1$, in a, and $\hat{e}_2$, in A_1.

   (a) Case $\hat{C}$ deep in 1.
       Taking $m_1 = \hat{m}_{11}$, $m_3 = \hat{m}_{13}$, $m_2 = \hat{m}_{12} + \hat{m}_2$, $\pi_1 = \hat{\pi}_1 \cdot \theta_1$, $\pi_3 = \hat{\pi}_3 \cdot \theta_1$, $\pi_2 = \hat{\pi}_2 \cdot \theta_1 \oplus \theta_2$, $C = \mathbf{par} \cdot (\hat{C} + B_2)$, $e_1 = \hat{e}_1$, and $e_2 = \hat{e}_2$, we have clause 1.

   (b) Case $\hat{C}$ shallow in 1.
       By Lemma 14 for B_2 there exist $\hat{m}_{21}$, $\hat{m}_{22}$, $\phi_1 : \hat{m}_2 \to \hat{m}_{21}$ and $\phi_2 : \hat{m}_2 \to \hat{m}_{22}$ a partition, and $B'_2 : \hat{m}_{21} \to 1$ linear and deep, such that $\hat{m}_2 = \hat{m}_{21} + \hat{m}_{22}$ and $B_2 \equiv \mathbf{par}_{1+\hat{m}_{22}} \cdot (B'_2 + \mathbf{id}_{\hat{m}_{22}}) \cdot (\phi_1 \oplus \phi_2)$.
       Taking $m_1 = \hat{m}_{11}$, $m_3 = \hat{m}_{13} + \hat{m}_{22}$, $m_2 = \hat{m}_{12} + \hat{m}_{21}$, $\pi_1 = \hat{\pi}_1 \cdot \theta_1$, $\pi_3 = \hat{\pi}_3 \cdot \theta_1 \oplus \phi_2 \cdot \theta_2$, $\pi_2 = \hat{\pi}_2 \cdot \theta_1 \oplus \phi_1 \cdot \theta_2$, $C = \mathbf{par} \cdot (\hat{C} + B'_2)$, $e_1 = \hat{e}_1 + 0_{\hat{m}_{22}}$, and $e_2 = \hat{e}_2 + \phi_2 \cdot \theta_2 \cdot b$, we have clause 1.

2. (a is deeply in a component of $\theta_1 \cdot b$) $\hat{m}_1 \geq 1$ and there exist

   $\hat{\pi}_1 : \hat{m}_1 \to 1$ and $\hat{\pi}_2 : \hat{m}_1 \to (\hat{m}_1 - 1)$ a partition
   $E : 1 \to 1$ linear and deep

   such that

   $$
   \begin{aligned}
   A_1 &\equiv B_1 \cdot (\hat{\pi}_1 \oplus \hat{\pi}_2)^{-1} \cdot (E + \hat{\pi}_2 \cdot \theta_1 \cdot b) \\
   E \cdot a &\equiv \hat{\pi}_1 \cdot \theta_1 \cdot b
   \end{aligned}
   $$

   Taking $\pi_1 = \hat{\pi}_1 \cdot \theta_1$ and $\pi_2 = \hat{\pi}_2 \cdot \theta_1 \oplus \theta_2$ we have clause 2.

Associativity   1. Case $A \cdot a = \langle c_1 \,|\, (c_2 \,|\, c_3) \rangle_0$ and $B \cdot b = \langle (c_1 \,|\, c_2) \,|\, c_3 \rangle_0$
     By $A \neq \mathbf{id}_1$ one of the following holds.

   (a) $A = \mathbf{par} \cdot (c_1 + \mathbf{id}_1)$ and $a = c_2 \mid c_3$

   (b) $A = \mathbf{par} \cdot (A_1 + \mathbf{par} \cdot (A_2 + A_3))$ and $k \in 1..3$ with A_k linear of type $1 \to 1$ and the other A_i of type $0 \to 1$. Here $A_k \cdot a = c_k$ and $A_i = c_i$ for $i \neq k$.

By $B \neq \mathbf{id}_1$ one of the following holds.

   (a) There exist $B_2 : (m-1) \to 1$ linear, and a partition $\theta_1 : m \to 1$ and $\theta_2 : m \to (m-1)$, such that

$$B = \mathbf{par} \cdot (\mathbf{id}_1 + B_2) \cdot (\theta_1 \oplus \theta_2)$$

       Here $\theta_1 \cdot b = c_1 \mid c_2$ and $B_2 \cdot \theta_2 \cdot b = c_3$.

   (b) There exist $\hat{m}_1$, $\hat{m}_2$ and $\hat{m}_3$ which sum to m, $B_i : \hat{m}_i \to 1$ linear for $i \in 1..3$, and a partition $\theta_i : m \to \hat{m}_i$ for $i \in 1..3$, such that

$$B = \mathbf{par} \cdot (\mathbf{par} \cdot (B_1 + B_2) + B_3) \cdot (\theta_1 \oplus \theta_2 \oplus \theta_3)$$

       Here $B_i \cdot \theta_i \cdot b = c_i$ for $i \in 1..3$.

We give only the most interesting cases.

Case (a)(a). By Lemma 14 for B_2 there exist $\hat{m}_1$, $\hat{m}_2$, $\hat{\pi}_1 : (m-1) \to \hat{m}_1$ and $\hat{\pi}_2 : (m-1) \to \hat{m}_2$ a partition, and $B_2' : \hat{m}_1 \to 1$ linear and deep, such that $(m-1) = \hat{m}_1 + \hat{m}_2$ and $B_2 \equiv \mathbf{par}_{1+\hat{m}_2} \cdot (B_2' + \mathbf{id}_{\hat{m}_2}) \cdot (\hat{\pi}_1 \oplus \hat{\pi}_2)$.
Taking $m_1 = \hat{m}_1$, $m_3 = 1 + \hat{m}_2$, $m_2 = 0$, $\pi_1 = \hat{\pi}_1 \cdot \theta_2$, $\pi_3 = \theta_1 \oplus \hat{\pi}_2 \cdot \theta_2$, $\pi_2 = \langle\rangle_m$, $C = \mathbf{id}_1$, $D = B_2'$, $e_1 = c_2 + \hat{\pi}_2 \cdot \theta_2 \cdot b$, and $e_2 = c_1 + 0_{\hat{m}_2}$, we have clause 1.

Case (b)(a) with $k = 1$. Here $A = \mathbf{par} \cdot (A_1 + (c_2 \mid c_3))$ and $\theta_1 \cdot b = (A_1 \cdot a) \mid c_2$ and $B_2 \cdot \theta_2 \cdot b = c_3$.

    i. Case A_1 deep. Taking $\pi_1 = \theta_1$, $\pi_2 = \theta_2$ and $E = \mathbf{par} \cdot (A_1 + c_2)$ we have clause 2.

   ii. Case A_1 shallow. By Lemma 14 for B_2 there exist $\hat{m}_1$, $\hat{m}_2$, $\hat{\pi}_1 : (m-1) \to \hat{m}_1$ and $\hat{\pi}_2 : (m-1) \to \hat{m}_2$ a partition, and $B_2' : \hat{m}_1 \to 1$ linear and deep, such that $(m-1) = \hat{m}_1 + \hat{m}_2$ and $B_2 \equiv \mathbf{par}_{1+\hat{m}_2} \cdot (B_2' + \mathbf{id}_{\hat{m}_2}) \cdot (\hat{\pi}_1 \oplus \hat{\pi}_2)$.
Taking $m_1 = 0$, $m_3 = 1 + \hat{m}_2$, $m_2 = \hat{m}_1$, $\pi_1 = \langle\rangle_m$, $\pi_3 = \theta_1 \oplus \hat{\pi}_2 \cdot \theta_2$, $\pi_2 = \hat{\pi}_1 \cdot \theta_2$, $C = \mathbf{par} \cdot (\mathbf{id}_1 + B_2')$, $D = \langle 0 \rangle_0$, $e_1 = a + 0_{\hat{m}_2}$, and $e_2 = (A_1 \cdot c_2) + \hat{\pi}_2 \cdot \theta_2 \cdot b$, we have clause 1.

    2. The case $A \cdot a = \langle (c_1 \mid c_2) \mid c_3 \rangle_0$ and $B \cdot b = \langle c_1 \mid (c_2 \mid c_3) \rangle_0$ is similar.

Sigma-Cong We have $A \cdot a = \langle \sigma(c_1, \ldots, c_{|\sigma|}) \rangle_0$, $B \cdot b = \langle \sigma(d_1, \ldots, d_{|\sigma|}) \rangle_0$, $\sigma \neq \mid$ and $\forall i \in 1..|\sigma| . \ \langle c_i \rangle_0 \equiv \langle d_i \rangle_0$.

By $A \neq \mathbf{id}_1$ there exist $a_1, \ldots, a_{|\sigma|}$ and $k \in 1..|\sigma|$ such that $A = \langle \sigma(a_1, \ldots, a_{|\sigma|}) \rangle_1$, $|\sigma| \geq 1$ and $\_1$ occurs only in a_k. We have $\langle a_k \rangle_1 : 1 \to 1$ linear and $\langle a_i \rangle_0 : 0 \to 1$ for $i \neq k$.

By $B \neq \mathbf{id}_1$ there exist $\hat{m}_1, \ldots, \hat{m}_{|\sigma|}$ which sum to m, $B_i : \hat{m}_i \to 1$ linear for $i \in 1..|\sigma|$, and a partition $\theta_i : m \to \hat{m}_i$ for $i \in 1..|\sigma|$, such that

$$B = \sigma \cdot (B_1 + \ldots + B_{|\sigma|}) \cdot (\theta_1 \oplus \ldots \oplus \theta_{|\sigma|})$$

Take $k = 1$, to reduce the notational clutter – the general case will be similar. We have $\langle a_1 \rangle_1 \cdot a \equiv B_1 \cdot \theta_1 \cdot b$, so by the induction hypothesis one of the following holds.

    1. (a is not deeply in any component of $\theta_1 \cdot b$) There exist

$$
\begin{aligned}
&m_1, \hat{m}_{12} \text{ and } m_3 \text{ such that } m_1 + \hat{m}_{12} + m_3 = \hat{m}_1 \\
&\hat{\pi}_1 : \hat{m}_1 \to m_1, \ \hat{\pi}_2 : \hat{m}_1 \to \hat{m}_{12} \text{ and } \hat{\pi}_3 : \hat{m}_1 \to m_3 \text{ a partition} \\
&\hat{C} : 1 + \hat{m}_{12} \to 1 \text{ linear and 1-separated} \\
&D : m_1 \to 1 \text{ linear and deep} \\
&e_1 : 0 \to m_3 \\
&e_2 : 0 \to m_3
\end{aligned}
$$

such that

$$
\begin{aligned}
\langle a_1 \rangle_1 &\equiv \hat{C} \cdot (\mathbf{par}_{1+m_3} \cdot (\mathbf{id}_1 + e_2) + \hat{\pi}_2 \cdot \theta_1 \cdot b) \\
a &\equiv \mathbf{par}_{1+m_3} \cdot (D \cdot \hat{\pi}_1 \cdot \theta_1 \cdot b + e_1) \\
B_1 &\equiv \hat{C} \cdot (\mathbf{par}_{1+m_3} \cdot (D + \mathbf{id}_{m_3}) + \mathbf{id}_{\hat{m}_{12}}) \cdot (\hat{\pi}_1 \oplus \hat{\pi}_3 \oplus \hat{\pi}_2) \\
\hat{\pi}_3 \cdot \theta_1 \cdot b &\equiv \mathbf{ppar}_{m_3} \cdot (e_1 + e_2)
\end{aligned}
$$

There are m_1 of the $\theta_1 \cdot b$ in a, $\hat{m}_{12}$ of the $\theta_1 \cdot b$ in $\langle a_1 \rangle_1$ and m_3 of the $\theta_1 \cdot b$ potentially overlapping $\langle a_1 \rangle_1$ and a. The latter are split into e_1, in a, and e_2, in $\langle a_1 \rangle_1$.

Taking $m_2 = \hat{m}_{12} + \hat{m}_2 + \ldots + \hat{m}_{|\sigma|}$, $\pi_1 = \hat{\pi}_1 \cdot \theta_1$, $\pi_3 = \hat{\pi}_3 \cdot \theta_1$, $\pi_2 = \hat{\pi}_2 \cdot \theta_1 \oplus \theta_2 \oplus \ldots \oplus \theta_{|\sigma|}$, and $C = \sigma \cdot (\hat{C} + B_2 + \ldots + B_{|\sigma|})$, we have clause 1.

2.   (a is deeply in a component of $\theta_1 \cdot b$) $\hat{m}_1 \geq 1$ and there exist

$$
\begin{aligned}
&\hat{\pi}_1 : \hat{m}_1 \to 1 \text{ and } \hat{\pi}_2 : \hat{m}_1 \to (\hat{m}_1 - 1) \text{ a partition} \\
&E : 1 \to 1 \text{ linear and deep}
\end{aligned}
$$

such that

$$
\begin{aligned}
\langle a_1 \rangle_1 &\equiv B_1 \cdot (\hat{\pi}_1 \oplus \hat{\pi}_2)^{-1} \cdot (E + \hat{\pi}_2 \cdot \theta_1 \cdot b) \\
E \cdot a &\equiv \hat{\pi}_1 \cdot \theta_1 \cdot b
\end{aligned}
$$

Taking $\pi_1 = \hat{\pi}_1 \cdot \theta_1$ and $\pi_2 = \hat{\pi}_2 \cdot \theta_1 \oplus \theta_2 \oplus \ldots \oplus \theta_{|\sigma|}$ we have clause 2.

Par-Cong   We have $A \cdot a = \langle c_1 \mid c_2 \rangle_0$, $B \cdot b = \langle d_1 \mid d_2 \rangle_0$, and $\forall i \in 1..2$. $\langle c_i \rangle_0 \equiv \langle d_i \rangle_0$.

By $A \neq \mathbf{id}_1$ there exist $A_1 : 1 \to 1$ linear and $A_2 : 0 \to 1$ (the symmetric case will be similar) such that $A = \mathbf{par} \cdot (A_1 + A_2)$.

By $B \neq \mathbf{id}_1$ there exist $\hat{m}_1$ and $\hat{m}_2$ which sum to m, $B_i : \hat{m}_i \to 1$ linear for $i \in 1..2$, and a partition $\theta_i : m \to \hat{m}_i$ for $i \in 1..2$, such that

$$
B = \mathbf{par} \cdot (B_1 + B_2) \cdot (\theta_1 \oplus \theta_2)
$$

We have $A_1 \cdot a \equiv B_1 \cdot \theta_1 \cdot b$, so by the induction hypothesis one of the following holds.

1.   (a is not deeply in any component of $\theta_1 \cdot b$) There exist

$$
\begin{aligned}
&\hat{m}_{11}, \hat{m}_{12} \text{ and } \hat{m}_{13} \text{ such that } \hat{m}_{11} + \hat{m}_{12} + \hat{m}_{13} = \hat{m}_1 \\
&\hat{\pi}_1 : \hat{m}_1 \to \hat{m}_{11}, \ \hat{\pi}_2 : \hat{m}_1 \to \hat{m}_{12} \text{ and } \hat{\pi}_3 : \hat{m}_1 \to \hat{m}_{13} \text{ a partition} \\
&\hat{C} : 1 + \hat{m}_{12} \to 1 \text{ linear and 1-separated} \\
&D : \hat{m}_{11} \to 1 \text{ linear and deep} \\
&\hat{e}_1 : 0 \to \hat{m}_{13} \\
&\hat{e}_2 : 0 \to \hat{m}_{13}
\end{aligned}
$$

such that

$$
\begin{aligned}
A_1 &\equiv \hat{C} \cdot (\mathbf{par}_{1+\hat{m}_{13}} \cdot (\mathbf{id}_1 + \hat{e}_2) + \hat{\pi}_2 \cdot \theta_1 \cdot b) \\
a &\equiv \mathbf{par}_{1+\hat{m}_{13}} \cdot (D \cdot \hat{\pi}_1 \cdot \theta_1 \cdot b + \hat{e}_1) \\
B_1 &\equiv \hat{C} \cdot (\mathbf{par}_{1+\hat{m}_{13}} \cdot (D + \mathbf{id}_{\hat{m}_{13}}) + \mathbf{id}_{\hat{m}_{12}}) \cdot (\hat{\pi}_1 \oplus \hat{\pi}_3 \oplus \hat{\pi}_2) \\
\hat{\pi}_3 \cdot \theta_1 \cdot b &\equiv \mathbf{ppar}_{\hat{m}_{13}} \cdot (\hat{e}_1 + \hat{e}_2)
\end{aligned}
$$

There are $\hat{m}_{11}$ of the $\theta_1 \cdot b$ in a, $\hat{m}_{12}$ of the $\theta_1 \cdot b$ in A_1 and $\hat{m}_{13}$ of the $\theta_1 \cdot b$ potentially overlapping A_1 and a. The latter are split into $\hat{e}_1$, in a, and $\hat{e}_2$, in A_1.

(a)   Case $\hat{C}$ deep in 1.
   Taking $m_1 = \hat{m}_{11}$, $m_3 = \hat{m}_{13}$, $m_2 = \hat{m}_{12} + \hat{m}_2$, $\pi_1 = \hat{\pi}_1 \cdot \theta_1$, $\pi_3 = \hat{\pi}_3 \cdot \theta_1$, $\pi_2 = \hat{\pi}_2 \cdot \theta_1 \oplus \theta_2$, $C = \mathbf{par} \cdot (\hat{C} + B_2)$, $e_1 = \hat{e}_1$, and $e_2 = \hat{e}_2$, we have clause 1.

(**b**) Case $\hat{C}$ shallow in 1.

By Lemma 14 for B_2 there exist $\hat{m}_{21}$, $\hat{m}_{22}$, $\phi_1 : \hat{m}_2 \to \hat{m}_{21}$ and $\phi_2 : \hat{m}_2 \to \hat{m}_{22}$ a partition, and $B_2' : \hat{m}_{21} \to 1$ linear and deep, such that $\hat{m}_2 = \hat{m}_{21} + \hat{m}_{22}$ and $B_2 \equiv \mathbf{par}_{1+\hat{m}_{22}} \cdot (B_2' + \mathbf{id}_{\hat{m}_{22}}) \cdot (\phi_1 \oplus \phi_2)$.

Taking $m_1 = \hat{m}_{11}$, $m_3 = \hat{m}_{13} + \hat{m}_{22}$, $m_2 = \hat{m}_{12} + \hat{m}_{21}$, $\pi_1 = \hat{\pi}_1 \cdot \theta_1$, $\pi_3 = \hat{\pi}_3 \cdot \theta_1 \oplus \phi_2 \cdot \theta_2$, $\pi_2 = \hat{\pi}_2 \cdot \theta_1 \oplus \phi_1 \cdot \theta_2$, $C = \mathbf{par} \cdot (\hat{C} + B_2')$, $e_1 = \hat{e}_1 + 0_{\hat{m}_{22}}$, and $e_2 = \hat{e}_2 + \phi_2 \cdot \theta_2 \cdot b$, we have clause 1.

2. (a is deeply in a component of $\theta_1 \cdot b$) $\hat{m}_1 \geq 1$ and there exist

$$\hat{\pi}_1 : \hat{m}_1 \to 1 \text{ and } \hat{\pi}_2 : \hat{m}_1 \to (\hat{m}_1 - 1) \text{ a partition}$$
$$E : 1 \to 1 \text{ linear and deep}$$

such that

$$
\begin{aligned}
A_1 &\equiv B_1 \cdot (\hat{\pi}_1 \oplus \hat{\pi}_2)^{-1} \cdot (E + \hat{\pi}_2 \cdot \theta_1 \cdot b) \\
E \cdot a &\equiv \hat{\pi}_1 \cdot \theta_1 \cdot b
\end{aligned}
$$

Taking $\pi_1 = \hat{\pi}_1 \cdot \theta_1$ and $\pi_2 = \hat{\pi}_2 \cdot \theta_1 \oplus \theta_2$ we have clause 2.

Sym By the induction hypothesis.

Tran Consider $A \cdot a \equiv c$ and $c \equiv B \cdot b$ (the case $B \cdot b \equiv c$ and $c \equiv A \cdot a$ is symmetric).

By Lemma 16 for B there exist $n \in 1..m$, $\hat{m}_i \geq 1$ for $i \in 1..n$ summing to m, $\theta_i : m \to \hat{m}_i$ for $i \in 1..n$ a partition, $B_i : \hat{m}_i \to 1$ for $i \in 1..n$ linear and shallow, and $B' : n \to 1$ linear and clean, such that $B \equiv B' \cdot (B_1 + \ldots + B_n) \cdot (\theta_1 \oplus \ldots \oplus \theta_n)$.

By Lemma 17 for $B' \cdot (B_1 \cdot \theta_1 \cdot b + \ldots + B_n \cdot \theta_n \cdot b) \equiv c$ there exist $B'' : n \to 1$ linear and $b'' : 0 \to n$ such that $B' \equiv B''$, $(B_1 \cdot \theta_1 \cdot b + \ldots + B_n \cdot \theta_n \cdot b) \equiv b''$ and $c = B'' \cdot b''$.

We have $A \cdot a \equiv B'' \cdot b''$, so by the induction hypothesis one of the following holds.

1. (a is not deeply in any component of b'') There exist

$$n_1, n_2 \text{ and } n_3 \text{ such that } n_1 + n_2 + n_3 = n$$
$$\hat{\pi}_1 : n \to n_1, \ \hat{\pi}_2 : n \to n_2 \text{ and } \hat{\pi}_3 : n \to n_3 \text{ a partition}$$
$$\hat{C} : 1 + n_2 \to 1 \text{ linear and 1-separated}$$
$$\hat{D} : n_1 \to 1 \text{ linear and deep}$$
$$\hat{e}_1 : 0 \to n_3$$
$$\hat{e}_2 : 0 \to n_3$$

such that

$$
\begin{aligned}
A &\equiv \hat{C} \cdot (\mathbf{par}_{1+n_3} \cdot (\mathbf{id}_1 + \hat{e}_2) + \hat{\pi}_2 \cdot b'') \\
a &\equiv \mathbf{par}_{1+n_3} \cdot (\hat{D} \cdot \hat{\pi}_1 \cdot b'' + \hat{e}_1) \\
B'' &\equiv \hat{C} \cdot (\mathbf{par}_{1+n_3} \cdot (\hat{D} + \mathbf{id}_{n_3}) + \mathbf{id}_{n_2}) \cdot (\hat{\pi}_1 \oplus \hat{\pi}_3 \oplus \hat{\pi}_2) \\
\hat{\pi}_3 \cdot b'' &\equiv \mathbf{ppar}_{n_3} \cdot (\hat{e}_1 + \hat{e}_2)
\end{aligned}
$$

There are n_1 of the b'' in a, n_2 of the b'' in A and n_3 of the b'' potentially overlapping A and a. The latter are split into $\hat{e}_1$, in a, and $\hat{e}_2$, in A.

Take functions f_i for $i \in 1..3$, from $\{1, \ldots, n_i\}$ to $\{1, \ldots, n\}$, such that $\hat{\pi}_i = \langle_{-f_i(1)}, \ldots, _{-f_i(n_i)}\rangle_n$.

Take $m_1 = \hat{m}_{f_1(1)} + \ldots + \hat{m}_{f_1(n_1)}$, $m_3 = \hat{m}_{f_3(1)} + \ldots + \hat{m}_{f_3(n_3)}$, $m_2 = \hat{m}_{f_2(1)} + \ldots + \hat{m}_{f_2(n_2)}$, $\pi_1 = \theta_{f_1(1)} \oplus \ldots \oplus \theta_{f_1(n_1)}$, $\pi_3 = \theta_{f_3(1)} \oplus \ldots \oplus \theta_{f_3(n_3)}$, and $\pi_2 = \theta_{f_2(1)} \oplus \ldots \oplus \theta_{f_2(n_2)}$.

From the 4th equation $B_{f_3(1)} \cdot \theta_{f_3(1)} \cdot b + \ldots + B_{f_3(n_3)} \cdot \theta_{f_3(n_3)} \cdot b \equiv \mathbf{ppar}_{n_3} \cdot (\hat{e}_1 + \hat{e}_2)$. We can therefore split each $B_{f_3(i)}$ and $\theta_{f_3(i)} \cdot b$ into a part in $\hat{e}_1$ and a part in $\hat{e}_2$. There therefore exist $E_1 : 0 \to n_3$, $E_2 : 0 \to n_3$, $e_1 : 0 \to m_3$, $e_2 : 0 \to m_3$ such that

$$
\begin{aligned}
B_{f_3(1)} \cdot 0_{\hat{m}_{f_3(1)}} + \ldots + B_{f_3(n_3)} \cdot 0_{\hat{m}_{f_3(n_3)}} &\equiv \mathbf{ppar}_{n_3} \cdot (E_1 + E_2) \\
\pi_3 \cdot b &\equiv \mathbf{ppar}_{m_3} \cdot (e_1 + e_2)
\end{aligned}
$$

$$
\begin{aligned}
\hat{e}_1 &\equiv \mathbf{ppar}_{n_3} \cdot (E_1 + (\mathbf{par}_{\hat{m}_{f_3(1)}} + \ldots + \mathbf{par}_{\hat{m}_{f_3(n_3)}}) \cdot e_1) \\
\hat{e}_2 &\equiv \mathbf{ppar}_{n_3} \cdot (E_2 + (\mathbf{par}_{\hat{m}_{f_3(1)}} + \ldots + \mathbf{par}_{\hat{m}_{f_3(n_3)}}) \cdot e_2)
\end{aligned}
$$

Taking $C = \hat{C} \cdot (\mathbf{par}_{1+n_3} \cdot (\mathbf{id}_1 + E_2) + B_{f_2(1)} + \ldots + B_{f_2(n_2)})$ and $D = \mathbf{par}_{n_3+1} \cdot (E_1 + \hat{D} \cdot (B_{f_1(1)} + \ldots + B_{f_1(n_1)}))$ we have clause 1.

2. (a is deeply in a component of b'') $n \geq 1$ and there exist

$$
\begin{aligned}
&\hat{\pi}_1 : n \to 1 \text{ and } \hat{\pi}_2 : n \to (n-1) \text{ a partition} \\
&\hat{E} : 1 \to 1 \text{ linear and deep}
\end{aligned}
$$

such that

$$
\begin{aligned}
A &\equiv B'' \cdot (\hat{\pi}_1 \oplus \hat{\pi}_2)^{-1} \cdot (\hat{E} + \hat{\pi}_2 \cdot b'') \\
\hat{E} \cdot a &\equiv \hat{\pi}_1 \cdot b''
\end{aligned}
$$

Suppose $\hat{\pi}_1 \oplus \hat{\pi}_2 = \mathbf{id}_n$, to reduce the notational clutter – the general case will be similar. We then have $A \equiv B'' \cdot (\hat{E} + B_2 \cdot \theta_2 \cdot b + \ldots + B_n \cdot \theta_n \cdot b)$ and $\hat{E} \cdot a \equiv B_1 \cdot \theta_1 \cdot b$.

As $\hat{E}$ is deep and B_1 is shallow we know that either a is in B_1 or in one of the components of $\theta_1 \cdot b$.

(a) There exists $E : 1 \to 1$ linear and deep such that $B_1 \cdot 0_{\hat{m}_1} \equiv E \cdot a$ and $\hat{E} \equiv \mathbf{par}_{1+\hat{m}_1} \cdot (E + \theta_1 \cdot b)$.

Taking $m_1 = 0$, $m_3 = 0$, $m_2 = m$, $\pi_1 = \langle\rangle_m$, $\pi_3 = \langle\rangle_m$, $\pi_2 = \theta_1 \oplus \ldots \oplus \theta_n$, $C = B'' \cdot (\mathbf{par}_{1+\hat{m}_1} \cdot (E + \mathbf{id}_{\hat{m}_1}) + B_2 + \ldots + B_n)$, $D = a$, $e_1 = \langle\rangle_0$, and $e_2 = \langle\rangle_0$, we have clause 1.

(b) There exist $\phi_1 : \hat{m}_1 \to 1$ and $\phi_2 : \hat{m}_1 \to \hat{m}_1 - 1$ a partition and $E : 1 \to 1$ linear and deep such that $E \cdot a \equiv \phi_1 \cdot \theta_1 \cdot b$ and $\hat{E} \equiv B_1 \cdot (\phi_1 \oplus \phi_2)^{-1} \cdot (E + \phi_2 \cdot \theta_1 \cdot b)$.

Taking $\pi_1 = \phi_1 \cdot \theta_1$ and $\pi_2 = \phi_2 \cdot \theta_1 \oplus \theta_2 \oplus \ldots \oplus \theta_n$ we have clause 2.

$\square$

LEMMA 19 *If*

$$
\begin{aligned}
A &: 1 \to 1 & B &: 1 \to 1 \\
a &: 0 \to 1 & b &: 0 \to 1
\end{aligned}
$$

with A and B linear, and $A \cdot a \equiv B \cdot b$, then one of the following holds.

1. *(a and b are disjoint) There exists $E : 2 \to 1$ linear such that*

$$
A \equiv E \cdot (\_ + b) \qquad B \equiv E \cdot (a + \_)
$$

2. *(a and b overlap) There exist $C : 1 \to 1$ linear and $z_{\mathsf{A,b}}$, $z_{\mathsf{a,B}}$ and $z_{\mathsf{a,b}}$ such that*

$$
\begin{aligned}
A &\equiv C \cdot (z_{\mathsf{A,b}} \mid \_) \\
B &\equiv C \cdot (z_{\mathsf{a,B}} \mid \_) \\
a &\equiv z_{\mathsf{a,B}} \mid z_{\mathsf{a,b}} \\
b &\equiv z_{\mathsf{A,b}} \mid z_{\mathsf{a,b}}
\end{aligned}
$$

and moreover $z_{\mathsf{a,b}} \not\equiv 0$

3. *(A is properly in B and b is deeply in a) There exists $D : 1 \to 1$ linear and deep such that*

$$
\begin{aligned}
a &\equiv D \cdot b \\
A \cdot D &\equiv B
\end{aligned}
$$

4. *(B is properly in A and a is deeply in b) There exists $D : 1 \to 1$ linear and deep such that*

$$
\begin{aligned}
D \cdot a &\equiv b \\
A &\equiv B \cdot D
\end{aligned}
$$

LEMMA 20 *If $m \geq 0$,*

$$
\begin{aligned}
a_1 &: 0 \to 1 & C &: m \to 1 \\
a_2 &: 0 \to 1 & d &: 0 \to m
\end{aligned}
$$

with C linear, and $a_1 \mid a_2 \equiv C \cdot d$, then there exist

m_1, m_2 *and m_3 such that $m_1 + m_2 + m_3 = m$*
$\pi_i : m \to m_i$ *for $i \in \{1, 2, 3\}$ a partition*
$C_1 : m_1 \to 1$ *linear and deep*
$C_2 : m_2 \to 1$ *linear and deep*
$e_1 : 0 \to m_3$
$e_2 : 0 \to m_3$

such that

$$
\begin{aligned}
a_1 &\equiv \mathbf{par}_{1+m_3} \cdot (C_1 \cdot \pi_1 \cdot d + e_1) \\
a_2 &\equiv \mathbf{par}_{1+m_3} \cdot (C_2 \cdot \pi_2 \cdot d + e_2) \\
C &\equiv \mathbf{par}_{2+m_3} \cdot (C_1 + C_2 + \mathbf{id}_{m_3}) \cdot (\pi_1 \oplus \pi_2 \oplus \pi_3) \\
\pi_3 \cdot d &\equiv \mathbf{ppar}_{m_3} \cdot (e_1 + e_2)
\end{aligned}
$$

There are m_1 of the d in a_1, m_2 of the d in a_2 and m_3 of the d potentially overlapping a_1 and a_2. The latter are split into e_1, in a_1, and e_2, in a_2.

LEMMA 21 *If $m \geq 0$,*

$$
\begin{aligned}
a_1 &: 0 \to 1 & C &: m \to 1 \\
a_2 &: 0 \to 1 & d &: 0 \to m
\end{aligned}
$$

with C linear and deep, and $a_1 \mid a_2 \equiv C \cdot d$, then there exist

m_1 *and m_2 such that $m_1 + m_2 = m$*
$\pi_i : m \to m_i$ *for $i \in \{1, 2\}$ a partition*
$C_1 : m_1 \to 1$ *linear and deep*
$C_2 : m_2 \to 1$ *linear and deep*

such that

$$
\begin{aligned}
a_1 &\equiv C_1 \cdot \pi_1 \cdot d \\
a_2 &\equiv C_2 \cdot \pi_2 \cdot d \\
C &\equiv \mathbf{par}_2 \cdot (C_1 + C_2) \cdot (\pi_1 \oplus \pi_2)
\end{aligned}
$$

There are m_1 of the d in a_1 and m_2 of the d in a_2.

LEMMA 22 *If $m \geq 1$,*

$$A : 1 \to 1 \quad b : 0 \to m$$
$$s : 0 \to 1$$

with A linear and deep, and $A \cdot s \equiv \mathbf{par}_m \cdot b$, then there exist

$$\pi_1 : m \to 1 \text{ and } \pi_2 : m \to (m - 1) \text{ a partition}$$
$$\hat{A} : 1 \to 1 \text{ linear and deep}$$
$$\hat{a} : 0 \to (m - 1)$$

such that

$$\begin{aligned} A &\equiv \mathbf{par}_m \cdot (\hat{A} + \hat{a}) \\ \hat{A} \cdot s + \hat{a} &\equiv (\pi_1 \oplus \pi_2) \cdot b \end{aligned}$$

LEMMA 23 *If $m \geq 1$,*

$$A : 1 \to 1 \quad b : 0 \to m$$
$$s : 0 \to 1$$

with A linear and shallow, and $A \cdot s \equiv \mathbf{par}_m \cdot b$, then there exist

$$\hat{a} : 0 \to m$$
$$\hat{s} : 0 \to m$$

such that

$$\begin{aligned} A &\equiv \mathbf{par}_{1+m} \cdot (\mathbf{id}_1 + \hat{a}) \\ s &\equiv \mathbf{par}_m \cdot \hat{s} \\ \mathbf{ppar}_m \cdot (\hat{a} + \hat{s}) &\equiv b \end{aligned}$$

C.2   Forwards Lemmas

The three lemmas in this subsection show that if $A \cdot s$ has some labelled transition, where $A : 1 \to 1$ is linear, then either the transition is independent of s or s has a related labelled transition. We have chosen to consider arbitrary A – one could instead restrict to *atomic* A, in which the hole is under exactly one symbol. It is not clear whether this would allow significant simplifications.

LEMMA 24   *If* $A \cdot s \overset{I}{\longrightarrow} t$ *for* $A : 1 \to 1$ *linear and* $I \equiv \mathbf{id}_1$ *then one of the following holds.*

1. *There exists some* $H : 1 \to 1$ *such that* $t \equiv H \cdot s$ *and* $\forall \hat{s} : 0 \to 1 . \ \ A \cdot \hat{s} \overset{-}{\longrightarrow} H \cdot \hat{s}$.

2. *There exist*

$$
\begin{aligned}
&n \geq 0 \\
&F : (1 + n) \to 1 \ \textit{linear} \\
&T : n \to 1 \\
&C \in \mathcal{C} \\
&v : 0 \to n
\end{aligned}
$$

   such that $s \overset{F}{\longrightarrow} T$, $A \equiv C \cdot F \cdot (\mathbf{id}_1 + v)$ *and* $t \equiv C \cdot T \cdot v$.

PROOF   By definition

$$\exists \langle m, L, R \rangle \in \mathcal{R}, B \in \mathcal{C}, u : 0 \to m . \ \ A \cdot s \equiv B \cdot L \cdot u \wedge B \cdot R \cdot u \equiv t$$

The proof involves a number of cases, summarized below.

   1 s and $L \cdot u$ are disjoint. Clause 1 holds.

   2 s and $L \cdot u$ may overlap.

   2a the overlap is trivial. Clause 1 holds.

   2b the overlap is non-trivial. Clause 2 holds with F shallow in 1 and not $\mathbf{id}_1$.

   3 $L \cdot u$ is deeply in s. Clause 2 holds with $F = \mathbf{id}_1$.

   4 s is deeply in $L \cdot u$.

   4a s is not deeply in any component of u.

   4(a)i s non-trivially overlaps L. Clause 2 holds with F deep in 1.

   4(a)ii s does not overlap L. Clause 1 holds.

   4b s is deeply in a component of u. Clause 1 holds.

We now consider the cases in detail. Applying Lemma 19 to $A \cdot s \equiv B \cdot (L \cdot u)$ we have

1.   (s and $L \cdot u$ are disjoint) There exists $E : 2 \to 1$ linear such that

$$A \quad \equiv \quad E \cdot (\_ + L \cdot u) \qquad\qquad B \quad \equiv \quad E \cdot (s + \_)$$

Putting $H \overset{def}{=} E \cdot (\_ + R \cdot u)$ we have clause 1 of the conclusion.

$$
\begin{aligned}
A \cdot \hat{s} \quad &\equiv \quad E \cdot (\hat{s} + L \cdot u) \\
&\equiv \quad E \cdot (\hat{s} + \_) \cdot L \cdot u \\
&\longrightarrow \quad E \cdot (\hat{s} + \_) \cdot R \cdot u \\
&\equiv \quad H \cdot \hat{s}
\end{aligned}
$$

using the fact that $E \cdot (s + \_) \in \mathcal{C} \Rightarrow \forall s' . \ \ E \cdot (s' + \_) \in \mathcal{C}$.

2. (s and $L \cdot u$ overlap) There exist $D : 1 \to 1$ linear and $z_{\mathsf{A},\mathsf{L} \cdot u}$, $z_{\mathsf{s},\mathsf{B}}$ and $z_{\mathsf{s},\mathsf{L} \cdot u}$ such that

$$
\begin{aligned}
A &\equiv D \cdot (z_{\mathsf{A},\mathsf{L} \cdot u} \mid \_) \\
B &\equiv D \cdot (z_{\mathsf{s},\mathsf{B}} \mid \_) \\
s &\equiv z_{\mathsf{s},\mathsf{B}} \mid z_{\mathsf{s},\mathsf{L} \cdot u} \\
L \cdot u &\equiv z_{\mathsf{A},\mathsf{L} \cdot u} \mid z_{\mathsf{s},\mathsf{L} \cdot u}
\end{aligned}
$$

and moreover $z_{\mathsf{s},\mathsf{L} \cdot u} \not\equiv 0$

Applying Lemma 20 to $z_{\mathsf{s},\mathsf{L} \cdot u} \mid z_{\mathsf{A},\mathsf{L} \cdot u} \equiv L \cdot u$ we have that there exist

$$
\begin{aligned}
&m_1, m_2 \text{ and } m_3 \text{ such that } m_1 + m_2 + m_3 = m \\
&\pi_i : m \to m_i \text{ for } i \in \{1, 2, 3\} \text{ a partition} \\
&L_1 : m_1 \to 1 \text{ linear and deep} \\
&L_2 : m_2 \to 1 \text{ linear and deep} \\
&e_1 : 0 \to m_3 \\
&e_2 : 0 \to m_3
\end{aligned}
$$

such that

$$
\begin{aligned}
z_{\mathsf{s},\mathsf{L} \cdot u} &\equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot \pi_1 \cdot u + e_1) \\
z_{\mathsf{A},\mathsf{L} \cdot u} &\equiv \mathbf{par}_{1+m_3} \cdot (L_2 \cdot \pi_2 \cdot u + e_2) \\
L &\equiv \mathbf{par}_{2+m_3} \cdot (L_1 + L_2 + \mathbf{id}_{m_3}) \cdot (\pi_1 \oplus \pi_2 \oplus \pi_3) \\
\pi_3 \cdot u &\equiv \mathbf{ppar}_{m_3} \cdot (e_1 + e_2)
\end{aligned}
$$

There are m_1 of the u in $z_{\mathsf{s},\mathsf{L} \cdot u}$, m_2 of the u in $z_{\mathsf{A},\mathsf{L} \cdot u}$ and m_3 of the u potentially overlapping $z_{\mathsf{s},\mathsf{L} \cdot u}$ and $z_{\mathsf{A},\mathsf{L} \cdot u}$. The latter are split into e_1, in $z_{\mathsf{s},\mathsf{L} \cdot u}$, and e_2, in $z_{\mathsf{A},\mathsf{L} \cdot u}$.

Note that as L_2 deep we have $L_2 \cdot \pi_2 \cdot u \equiv 0 \iff m_2 = 0 \wedge L_2 \equiv \langle 0 \rangle_0$.

We now have two cases, one with $L \cdot u$ properly in s and one with a non-trivial overlap.

(a) Case $L_2 \cdot \pi_2 \cdot u \equiv 0 \wedge m_3 = 0$.

Here $m_2 = m_3 = 0$, $L_2 \equiv \langle 0 \rangle_0$, $L \equiv L_1 \cdot \pi_1$ and $z_{\mathsf{A},\mathsf{L} \cdot u} \equiv 0$ so $s \equiv z_{\mathsf{s},\mathsf{B}} \mid L \cdot u$. Taking

$$
\begin{aligned}
n &\stackrel{def}{=} 0 & \\
F &\stackrel{def}{=} \mathbf{id}_1 & : 1 \to 1 \\
T &\stackrel{def}{=} (z_{\mathsf{s},\mathsf{B}} \mid \_) \cdot R \cdot u & : 0 \to 1 \\
C &\stackrel{def}{=} A & : 1 \to 1 \\
v &\stackrel{def}{=} \langle \rangle_0 & : 0 \to 0
\end{aligned}
$$

we have clause 2 of the conclusion. We have to check

$$
\begin{aligned}
s &\equiv z_{\mathsf{s},\mathsf{B}} \mid L \cdot u \\
&\equiv (z_{\mathsf{s},\mathsf{B}} \mid \_) \cdot L \cdot u \\
&\longrightarrow (z_{\mathsf{s},\mathsf{B}} \mid \_) \cdot R \cdot u \\
&\equiv T \\
A &\equiv C \\
&\equiv C \cdot F \cdot (\mathbf{id}_1 + v) \\
t &\equiv B \cdot R \cdot u \\
&\equiv D \cdot (z_{\mathsf{s},\mathsf{B}} \mid \_) \cdot R \cdot u \\
&\equiv D \cdot (z_{\mathsf{A},\mathsf{L} \cdot u} \mid \_) \cdot (z_{\mathsf{s},\mathsf{B}} \mid \_) \cdot R \cdot u \\
&\equiv A \cdot (z_{\mathsf{s},\mathsf{B}} \mid \_) \cdot R \cdot u \\
&\equiv C \cdot T \cdot v
\end{aligned}
$$

using $(z_{\mathsf{s},\mathsf{B}} \mid \_) \in \mathcal{C}$.

(**b**)   Case $L_2 \cdot \pi_2 \cdot u \not\equiv 0 \vee m_3 \neq 0$.
Taking

$$
\begin{aligned}
n & \stackrel{def}{=} & m_3 + m_2 \\
F & \stackrel{def}{=} & \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2) \\
T & \stackrel{def}{=} & (\_ \,|\, z_{\mathsf{s},\mathsf{B}}) \cdot R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2}) \\
C & \stackrel{def}{=} & D \\
v & \stackrel{def}{=} & (e_2 + \pi_2 \cdot u)
\end{aligned}
$$

we have clause 2 of the conclusion.   We have to check

$$
\begin{aligned}
& m_3 + m_2 \geq 0 \\
& \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2) : (1 + m_3 + m_2) \to 1 \text{ linear} \\
& (\_ \,|\, z_{\mathsf{s},\mathsf{B}}) \cdot R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2}) : m_3 + m_2 \to 1 \\
& D \in \mathcal{C} \\
& (e_2 + \pi_2 \cdot u) : 0 \to m_3 + m_2
\end{aligned}
$$

The 4th uses $D \cdot (\_ \,|\, z_{\mathsf{s},\mathsf{B}}) \in \mathcal{C} \Rightarrow D \in \mathcal{C}$. Moreover, we must check

$$
\begin{aligned}
A & \equiv & D \cdot (z_{\mathsf{A},\mathsf{L}\cdot u} \,|\, \_) \\
& \equiv & D \cdot \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + L_2 \cdot \pi_2 \cdot u + e_2) \\
& \equiv & D \cdot \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2) \cdot (\mathbf{id}_1 + (e_2 + \pi_2 \cdot u)) \\
& \equiv & C \cdot F \cdot (\mathbf{id}_1 + v) \\
t & \equiv & B \cdot R \cdot u \\
& \equiv & D \cdot (z_{\mathsf{s},\mathsf{B}} \,|\, \_) \cdot R \cdot u \\
& \equiv & D \cdot (\_ \,|\, z_{\mathsf{s},\mathsf{B}}) \cdot R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2}) \cdot (e_2 + \pi_2 \cdot u) \\
& \equiv & C \cdot T \cdot v
\end{aligned}
$$

and for the transition $s \xrightarrow{F} T$: there is a transition
$$
s \xrightarrow{\mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)} (\_ \,|\, z_{\mathsf{s},\mathsf{B}}) \cdot R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2})
$$
as
$\langle m, L, R \rangle \in \mathcal{R}$
m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$
$(\pi_1 \oplus \pi_3 \oplus \pi_2) : m \to m$ a permutation
$\mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2) : 1 + m_3 + m_2 \to 1$ linear, shallow in argument 1, and not $\mathbf{id}_1$
$z_{\mathsf{s},\mathsf{B}} : 0 \to 1$
$L_1 : m_1 \to 1$ linear and deep
$L_2 : m_2 \to 1$ linear and deep
$(\pi_1 \cdot u) : 0 \to m_1$
$e_1 : 0 \to m_3$
and

- $L \equiv \mathbf{par}_{2+m_3} \cdot (L_1 + \mathbf{id}_{m_3} + L_2) \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)$
- $s \equiv \mathbf{par}_{2+m_3} \cdot (z_{\mathsf{s},\mathsf{B}} + L_1 \cdot (\pi_1 \cdot u) + e_1)$
- $(\_ \,|\, z_{\mathsf{s},\mathsf{B}}) \cdot R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2}) \equiv \mathbf{par}_2 \cdot (z_{\mathsf{s},\mathsf{B}} + R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot ((\pi_1 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2}))$
- $\mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2) \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)$
- $m_3 = 0 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$

If $m_3 = 0$ then by assumption $L_2 \cdot \pi_2 \cdot u \not\equiv 0$, hence $L_2 \not\equiv \langle 0 \rangle_0$ so $F \not\equiv \mathbf{id}_1$. Further, $z_{\mathsf{s},\mathsf{L}\cdot u} \equiv L_1 \cdot \pi_1 \cdot u$ so we have $L_1 \cdot \pi_1 \cdot u \not\equiv 0$, hence $L_1 \not\equiv \langle 0 \rangle_0$.

3. (A is properly in B and $L \cdot u$ is deeply in s) There exists $D : 1 \to 1$ linear and deep such that

$$
\begin{aligned}
s &\equiv D \cdot L \cdot u \\
A \cdot D &\equiv B
\end{aligned}
$$

Taking

$$
\begin{aligned}
n &\stackrel{\text{def}}{=} 0 \\
F &\stackrel{\text{def}}{=} \mathbf{id}_1 &&: 1 \to 1 \\
T &\stackrel{\text{def}}{=} D \cdot R \cdot u &&: 0 \to 1 \\
C &\stackrel{\text{def}}{=} A &&: 1 \to 1 \\
v &\stackrel{\text{def}}{=} \langle \rangle_0 &&: 0 \to 0
\end{aligned}
$$

we have clause 2 of the conclusion. We have to check

$$
\begin{aligned}
s &\equiv D \cdot L \cdot u \\
&\longrightarrow D \cdot R \cdot u \\
&\equiv T
\end{aligned}
$$

using $A \cdot D \in \mathcal{C} \Rightarrow D \in \mathcal{C}$.

4. (B is properly in A and s is deeply in $L \cdot u$) There exists $D : 1 \to 1$ linear and deep such that

$$
\begin{aligned}
D \cdot s &\equiv L \cdot u \\
A &\equiv B \cdot D
\end{aligned}
$$

Applying Lemma 11 to $D \cdot s \equiv L \cdot u$ we have one of the following

(a) (s is not deeply in any component of u) There exist

m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$
$\pi_1 : m \to m_1$, $\pi_2 : m \to m_2$ and $\pi_3 : m \to m_3$ a partition
$L_2 : 1 + m_2 \to 1$ linear and 1-separated
$L_1 : m_1 \to 1$ linear and deep
$e_1 : 0 \to m_3$
$e_2 : 0 \to m_3$

such that

$$
\begin{aligned}
D &\equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (\mathbf{id}_1 + e_2) + \pi_2 \cdot u) \\
s &\equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot \pi_1 \cdot u + e_1) \\
L &\equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_1 + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2) \\
\pi_3 \cdot u &\equiv \mathbf{ppar}_{m_3} \cdot (e_1 + e_2)
\end{aligned}
$$

There are m_1 of the u in s, m_2 of the u in D and m_3 of the u potentially overlapping D and s. The latter are split into e_1, in s, and e_2, in D.

i. Case $m_3 = 1 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$.
Since D is deep we know that L_2 is deep in argument 1.
Taking

$$
\begin{aligned}
n &\stackrel{def}{=} m_3 + m_2 \\
F &\stackrel{def}{=} L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \\
T &\stackrel{def}{=} R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2}) \\
C &\stackrel{def}{=} B \\
v &\stackrel{def}{=} (e_2 + \pi_2 \cdot u)
\end{aligned}
$$

we have clause 2 of the conclusion. We have to check

$$
\begin{aligned}
m_3 + m_2 &\geq 0 \\
L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) &: (1 + m_3 + m_2) \to 1 \text{ linear} \\
R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2}) &: m_3 + m_2 \to 1 \\
B &\in \mathcal{C} \\
(e_2 + \pi_2 \cdot u) &: 0 \to m_3 + m_2
\end{aligned}
$$

Moreover, we must check that $A \equiv C \cdot F \cdot (\mathbf{id}_1 + v)$ and $t \equiv C \cdot T \cdot v$, i.e.

$$
\begin{aligned}
A &\equiv B \cdot L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (\mathbf{id}_1 + (e_2 + \pi_2 \cdot u)) \\
B \cdot R \cdot u &\equiv B \cdot R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2}) \cdot (e_2 + \pi_2 \cdot u)
\end{aligned}
$$

and for the transition $s \xrightarrow{F} T$: there is a transition

$$
s \xrightarrow{L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})} R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2})
$$

as

$\langle m, L, R \rangle \in \mathcal{R}$

m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$

$(\pi_1 \oplus \pi_3 \oplus \pi_2) : m \to m$ a permutation

$L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) : 1 + m_3 + m_2 \to 1$ linear, deep in argument 1

$L_1 : m_1 \to 1$ linear and deep

$L_2 : 1 + m_2 \to 1$ linear, deep in argument 1 and 1-separated

$\pi_1 \cdot u : 0 \to m_1$

$e_1 : 0 \to m_3$

and

- $L \equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_1 + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)$
- $s \equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot \pi_1 \cdot u + e_1)$
- $R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2}) \equiv R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e_1) + \mathbf{id}_{m_2})$
- $L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$
- $m_3 = 1 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$

ii. Case $m_3 = 1 \wedge L_1 \equiv \langle 0 \rangle_0$.

Putting $H \stackrel{def}{=} B \cdot R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\mathbf{par}_2 \cdot (\mathbf{id}_1 + e_2) + \pi_2 \cdot u)$ we have clause 1 of the conclusion. We have to check

$$
\begin{aligned}
A \cdot \hat{s} &\equiv B \cdot D \cdot \hat{s} \\
&\equiv B \cdot L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (\hat{s} + e_2) + \pi_2 \cdot u) \\
&\equiv B \cdot L_2 \cdot (\hat{s} \mid e_2 + \pi_2 \cdot u) \\
&\equiv B \cdot L \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\hat{s} \mid e_2 + \pi_2 \cdot u) \\
&\longrightarrow B \cdot R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\hat{s} \mid e_2 + \pi_2 \cdot u) \\
&\equiv H \cdot \hat{s} \\
t &\equiv B \cdot R \cdot u \\
&\equiv B \cdot R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (\pi_1 \cdot u + \pi_3 \cdot u + \pi_2 \cdot u) \\
&\equiv B \cdot R \cdot (\pi_1 \oplus \pi_3 \oplus \pi_2)^{-1} \cdot (s \mid e_2 + \pi_2 \cdot u) \\
&\equiv H \cdot s
\end{aligned}
$$

(**b**)   (s is deeply in a component of u) $m \geq 1$ and there exist

$$\pi_1 : m \to 1 \text{ and } \pi_2 : m \to (m-1) \text{ a partition}$$
$$E : 1 \to 1 \text{ linear and deep}$$

such that

$$D \equiv L \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot u)$$
$$E \cdot s \equiv \pi_1 \cdot u$$

Putting $H \stackrel{def}{=} B \cdot R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot u)$ we have clause 1 of the conclusion. We have to check

$$
\begin{aligned}
A \cdot \hat{s} \quad &\equiv \quad B \cdot D \cdot \hat{s} \\
&\equiv \quad B \cdot L \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot u) \cdot \hat{s} \\
&\longrightarrow \quad B \cdot R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot u) \cdot \hat{s} \\
&\equiv \quad H \cdot \hat{s} \\
t \quad &\equiv \quad B \cdot R \cdot u \\
&\equiv \quad B \cdot R \cdot (\pi_1 \oplus \pi_2)^{-1} \cdot (E + \pi_2 \cdot u) \cdot s \\
&\equiv \quad H \cdot s
\end{aligned}
$$

$\square$

LEMMA 25 *If $A \cdot s \xrightarrow{F} T$ for $A : 1 \to 1$ linear and $F : 1 + n \to 1$ linear and deep in 1 then one of the following holds.*

1. *There exists $H : 1 + n \to 1$ such that $T \equiv H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \xrightarrow{F} H \cdot (\hat{s} + \mathbf{id}_n)$.*

2. *There exist*

$$m_{13} \geq 0 \text{ and } m_{12} \geq 0 \text{ and } m_2 \geq 0 \text{ and } m_3 \geq 0$$
$$\text{such that } n = m_3 + m_2$$
$$L_{12} : 1 + m_{12} \to 1 \text{ linear, deep in 1 and 1-separated}$$
$$L_2 : 1 + m_2 \to 1 \text{ linear, deep in argument 1 and 1-separated}$$
$$\hat{T} : m_{13} + m_{12} + m_3 + m_2 \to 1$$
$$v_3 : 0 \to m_{13}$$
$$v_2 : 0 \to m_{12}$$
$$e : 0 \to m_3$$

   such that

$$s \xrightarrow{L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (L_{12} + \mathbf{id}_n) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12}+m_3+m_2})} \hat{T}$$
$$F \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$$
$$T \equiv \hat{T} \cdot (v_3 + v_2 + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2})$$
$$A \equiv \mathbf{par}_{1+m_3} \cdot (L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (\mathbf{id}_1 + v_3) + v_2) + e)$$

3. *There exist*

$$m_{12} \geq 0 \text{ and } m_2 \geq 0 \text{ and } m_3 \geq 0 \text{ such that } n = m_3 + m_2$$
$$L_{12} : m_{12} \to 1 \text{ linear and deep}$$
$$L_2 : 1 + m_2 \to 1 \text{ linear, deep in argument 1 and 1-separated}$$
$$\hat{T} : m_3 + m_{12} + m_2 \to 1$$
$$v : 0 \to m_{12}$$
$$\hat{\hat{a}} : 0 \to m_3$$

   such that

$$s \xrightarrow{L_2 \cdot (\mathbf{par}_{2+m_3} + \mathbf{id}_{m_2}) \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_{12} + \mathbf{id}_{m_2})} \hat{T}$$
$$F \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$$
$$T \equiv \hat{T} \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \hat{\hat{a}}) + v + \mathbf{id}_{m_2})$$
$$A \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + L_{12} \cdot v + \hat{\hat{a}})$$

PROOF By the definition of transitions there exist

$$\langle m, L, R \rangle \in \mathcal{R}$$
$$m_1, m_2 \text{ and } m_3 \text{ such that } m_1 + m_2 + m_3 = m \text{ and } n = m_3 + m_2$$
$$\pi : m \to m \text{ a permutation}$$
$$L_1 : m_1 \to 1 \text{ linear and deep}$$
$$L_2 : 1 + m_2 \to 1 \text{ linear, deep in argument 1 and 1-separated}$$
$$u : 0 \to m_1$$
$$e : 0 \to m_3$$

such that

$$L \equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_1 + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot \pi$$
$$A \cdot s \equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot u + e)$$
$$T \equiv R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})$$
$$F \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$$
$$m_3 = 1 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$$

The proof involves a number of cases, summarized below.

1 A deep.

    1a s is not in e.

      1(a)i s is not deeply in any component of u.

        1(a)iA s and L have a non-trivial overlap. Clause 2 holds.

        1(a)iB s is in u. Clause 1 holds.

      1(a)ii s is deeply in a component of u. Clause 1 holds.

    1b s is in one component of e. Clause 1 holds.

2 A shallow.

    2a s and L have a non-trivial overlap. Clause 3 holds.

    2b s is in e. Clause 1 holds.

We now consider the cases in detail.

1. Case A deep.

Applying Lemma 22 to $A \cdot s \equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot u + e)$ we have there exist

$$\psi_1 : 1 + m_3 \to 1 \text{ and } \psi_2 : 1 + m_3 \to (1 + m_3 - 1) \text{ a partition}$$
$$\hat{A} : 1 \to 1 \text{ linear and deep}$$
$$\hat{a} : 0 \to (1 + m_3 - 1)$$

such that

$$
\begin{aligned}
A &\equiv \mathbf{par}_{1+m_3} \cdot (\hat{A} + \hat{a}) \\
\hat{A} \cdot s + \hat{a} &\equiv (\psi_1 \oplus \psi_2) \cdot (L_1 \cdot u + e)
\end{aligned}
$$

(a) Case $\psi_1 = \langle \text{-1} \rangle_{1+m_3}$.

Here $\hat{A} \cdot s \equiv L_1 \cdot u$ and for any $z : 0 \to 1$ we have $\hat{a} \equiv \phi_2 \cdot (z + e)$.

Applying Lemma 11 to $\hat{A} \cdot s \equiv L_1 \cdot u$ we have one of the following

    i. (s is not deeply in any component of u) There exist

$$m_{11}, m_{12} \text{ and } m_{13} \text{ such that } m_{11} + m_{12} + m_{13} = m_1$$
$$\theta_1 : m_1 \to m_{11}, \ \theta_2 : m_1 \to m_{12} \text{ and } \theta_3 : m_1 \to m_{13} \text{ a partition}$$
$$L_{12} : 1 + m_{12} \to 1 \text{ linear and 1-separated}$$
$$L_{11} : m_{11} \to 1 \text{ linear and deep}$$
$$\hat{e}_1 : 0 \to m_{13}$$
$$\hat{e}_2 : 0 \to m_{13}$$

such that

$$
\begin{aligned}
\hat{A} &\equiv L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (\mathbf{id}_1 + \hat{e}_2) + \theta_2 \cdot u) \\
s &\equiv \mathbf{par}_{1+m_{13}} \cdot (L_{11} \cdot \theta_1 \cdot u + \hat{e}_1) \\
L_1 &\equiv L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (L_{11} + \mathbf{id}_{m_{13}}) + \mathbf{id}_{m_{12}}) \cdot (\theta_1 \oplus \theta_3 \oplus \theta_2) \\
\theta_3 \cdot u &\equiv \mathbf{ppar}_{m_{13}} \cdot (\hat{e}_1 + \hat{e}_2)
\end{aligned}
$$

There are m_{11} of the u in s, m_{12} of the u in $\hat{A}$ and m_{13} of the u potentially overlapping $\hat{A}$ and s. The latter are split into $\hat{e}_1$, in s, and $\hat{e}_2$, in $\hat{A}$.

A. Case $m_{13} = 1 \Rightarrow L_{11} \not\equiv \langle 0 \rangle_0$.

Note that by $\hat{A}$ deep we know L_{12} is deep in its first argument. Letting $\phi \stackrel{def}{=} ((\theta_1 \oplus \theta_3 \oplus \theta_2) + \mathbf{id}_{m_3+m_2}) \cdot \pi$ and taking

$$
\begin{aligned}
v_3 &= \hat{e}_2 \\
v_2 &= \theta_2 \cdot u \\
\hat{T} &= R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_{13}} \cdot (\mathbf{id}_{m_{13}} + \hat{e}_1) + \mathbf{id}_{m_{12}+m_3+m_2})
\end{aligned}
$$

we have clause 2 of the conclusion.
We have to check

- $T \equiv R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_{13}} \cdot (\mathbf{id}_{m_{13}} + \hat{e}_1) + \mathbf{id}_{m_{12}+m_3+m_2}) \cdot (\hat{e}_2 + \theta_2 \cdot u + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2})$
- $A \equiv \mathbf{par}_{1+m_3} \cdot (L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (\mathbf{id}_1 + \hat{e}_2) + \theta_2 \cdot u) + e)$

There is a transition
$$
s \xrightarrow{\; L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (L_{12} + \mathbf{id}_n) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12}+m_3+m_2}) \;} R \cdot \phi^{-1} \cdot (\theta_1 \cdot u \qquad +
$$
$\mathbf{ppar}_{m_{13}} \cdot (\mathbf{id}_{m_{13}} + \hat{e}_1) + \mathbf{id}_{m_{12}+m_3+m_2})$
as

  $\langle m, L, R \rangle \in \mathcal{R}$
  $m_{11}, m_{12}+m_3+m_2$ and m_{13} such that $m_{11}+m_{12}+m_3+m_2+m_{13} = m$
  $\phi : m \to m$ a permutation
  $L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (L_{12} + \mathbf{id}_n) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12}+m_3+m_2}) : 1 + m_{13} + m_{12} + m_3 + m_2 \to 1$ linear, deep in argument 1
  $L_{11} : m_{11} \to 1$ linear and deep
  $L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_{12} + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) : 1 + m_{12} + m_3 + m_2 \to 1$ linear, deep in argument 1 and 1-separated
  $\theta_1 \cdot u : 0 \to m_{11}$
  $\hat{e}_1 : 0 \to m_{13}$
and

- $L \equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_{12} + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot (\mathbf{par}_{1+m_{13}} \cdot (L_{11} + \mathbf{id}_{m_{13}}) + \mathbf{id}_{m_{12}+m_3+m_2}) \cdot \phi$
- $s \equiv \mathbf{par}_{1+m_{13}} \cdot (L_{11} \cdot \theta_1 \cdot u + \hat{e}_1)$
- $R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_{13}} \cdot (\mathbf{id}_{m_{13}} + \hat{e}_1) + \mathbf{id}_{m_{12}+m_3+m_2}) \equiv R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_{13}} \cdot (\mathbf{id}_{m_{13}} + \hat{e}_1) + \mathbf{id}_{m_{12}+m_3+m_2})$
- $L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (L_{12} + \mathbf{id}_n) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12}+m_3+m_2}) \equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_{12} + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12}+m_3+m_2})$
- $m_{13} = 1 \Rightarrow L_{11} \not\equiv \langle 0 \rangle_0$

B. Case $m_{13} = 1 \wedge L_{11} \equiv \langle 0 \rangle_0$.

Taking $H \stackrel{def}{=} R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_3 \oplus \theta_2)^{-1} \cdot (\mathbf{par}_2 \cdot (\mathbf{id}_1 + \hat{e}_2) + \theta_2 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})$ we have clause 1.
We have to check $H : 1 + n \to 1$, $T \equiv H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \xrightarrow{F} H \cdot (\hat{s} + \mathbf{id}_n)$. There is a transition

$A \cdot \hat{s} \xrightarrow{F} R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_3 \oplus \theta_2)^{-1} \cdot (\mathbf{par}_2 \cdot (\mathbf{id}_1 + \hat{e}_2) + \theta_2 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}) \cdot (\hat{s} + \mathbf{id}_n)$
as

  $\langle m, L, R \rangle \in \mathcal{R}$
  m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$ and $n = m_3 + m_2$
  $\pi : m \to m$ a permutation
  $F : 1 + m_3 + m_2 \to 1$ linear, deep in argument 1
  $L_1 : m_1 \to 1$ linear and deep
  $L_2 : 1 + m_2 \to 1$ linear, deep in argument 1 and 1-separated
  $(\theta_1 \oplus \theta_3 \oplus \theta_2)^{-1} \cdot (\hat{s} \mid \hat{e}_2 + \theta_2 \cdot u) : 0 \to m_1$
  $e : 0 \to m_3$
and

- $L \equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_1 + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot \pi$
- $A \cdot \hat{s} \equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot (\theta_1 \oplus \theta_3 \oplus \theta_2)^{-1} \cdot (\hat{s} \,|\, \hat{e}_2 + \theta_2 \cdot u) + e)$
- $R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_3 \oplus \theta_2)^{-1} \cdot (\mathbf{par}_2 \cdot (\mathbf{id}_1 + \hat{e}_2) + \theta_2 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}) \cdot (\hat{s} + \mathbf{id}_n) \equiv R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_3 \oplus \theta_2)^{-1} \cdot (\hat{s} \,|\, \hat{e}_2 + \theta_2 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})$
- $F \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$
- $m_3 = 1 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$

ii. (*s* is deeply in a component of *u*) $m_1 \geq 1$ and there exist

$$\theta_1 : m_1 \to 1 \text{ and } \theta_2 : m_1 \to (m_1 - 1) \text{ a partition}$$
$$J : 1 \to 1 \text{ linear and deep}$$

such that

$$\hat{A} \quad \equiv \quad L_1 \cdot (\theta_1 \oplus \theta_2)^{-1} \cdot (J + \theta_2 \cdot u)$$
$$J \cdot s \quad \equiv \quad \theta_1 \cdot u$$

Taking $H \overset{def}{=} R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J + \theta_2 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})$ we have clause 1.

We have to check $H : 1 + n \to 1$, $T \equiv H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \overset{F}{\longrightarrow} H \cdot (\hat{s} + \mathbf{id}_n)$. There is a transition

$$A \cdot \hat{s} \overset{F}{\longrightarrow} R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J + \theta_2 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}) \cdot (\hat{s} + \mathbf{id}_n)$$

as

> $\langle m, L, R \rangle \in \mathcal{R}$
> m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$ and $n = m_3 + m_2$
> $\pi : m \to m$ a permutation
> $F : 1 + m_3 + m_2 \to 1$ linear, deep in argument 1
> $L_1 : m_1 \to 1$ linear and deep
> $L_2 : 1 + m_2 \to 1$ linear, deep in argument 1 and 1-separated
> $(\theta_1 \oplus \theta_2)^{-1} \cdot (J \cdot \hat{s} + \theta_2 \cdot u) : 0 \to m_1$
> $e : 0 \to m_3$

and

- $L \equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_1 + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot \pi$
- $A \cdot \hat{s} \equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot (\theta_1 \oplus \theta_2)^{-1} \cdot (J \cdot \hat{s} + \theta_2 \cdot u) + e)$
- $R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J + \theta_2 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}) \cdot (\hat{s} + \mathbf{id}_n) \equiv R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J \cdot \hat{s} + \theta_2 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})$
- $F \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$
- $m_3 = 1 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$

(b) Case $\psi_1 \neq \langle \text{-}_1 \rangle_{1+m_3}$. i.e. $\hat{A} \cdot s$ is one component of e, some component of $\hat{a}$ is $L_1 \cdot u$ etc.

We have $(\psi_1 \oplus \psi_2)^{-1} \cdot (\hat{A} \cdot s + \hat{a}) = L_1 \cdot u + e$. Write $(\psi_1 \oplus \psi_2)^{-1}$ as $\hat{\psi}_1 \oplus \hat{\psi}_2$ where $\hat{\psi}_1 : 1 + m_3 \to 1$ and $\hat{\psi}_2 : 1 + m_3 \to m_3$, so for any $z : 0 \to 1$ we have $\hat{\psi}_1 \cdot (z + \hat{a}) \equiv L_1 \cdot u$ and $\hat{\psi}_2 \cdot (\hat{A} \cdot s + \hat{a}) \equiv e$.

Taking $H \overset{def}{=} R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\hat{\psi}_2 \cdot (\hat{A} + \hat{a}) + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2})$ we have clause 1.

We have to check $H : 1 + n \to 1$, $T \equiv H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \overset{F}{\longrightarrow} H \cdot (\hat{s} + \mathbf{id}_n)$. There is a transition

$$A \cdot \hat{s} \overset{F}{\longrightarrow} R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\hat{\psi}_2 \cdot (\hat{A} + \hat{a}) + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot (\hat{s} + \mathbf{id}_n)$$

as

> $\langle m, L, R \rangle \in \mathcal{R}$
> m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$ and $n = m_3 + m_2$
> $\pi : m \to m$ a permutation
> $F : 1 + m_3 + m_2 \to 1$ linear, deep in argument 1
> $L_1 : m_1 \to 1$ linear and deep

$L_2 : 1 + m_2 \to 1$ linear, deep in argument 1 and 1-separated

$u : 0 \to m_1$

$\hat{\psi}_2 \cdot (\hat{A} \cdot \hat{s} + \hat{a}) : 0 \to m_3$

and

- $L \equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_1 + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot \pi$
- $A \cdot \hat{s} \equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot u + \hat{\psi}_2 \cdot (\hat{A} \cdot \hat{s} + \hat{a}))$
- $R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\hat{\psi}_2 \cdot (\hat{A} + \hat{a}) + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot (\hat{s} + \mathbf{id}_n) \equiv R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \hat{\psi}_2 \cdot (\hat{A} \cdot \hat{s} + \hat{a})) + \mathbf{id}_{m_2})$
- $F \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$
- $m_3 = 1 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$

2. Case A shallow.

Applying Lemma 23 to $A \cdot s \equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot u + e)$ we have that there exist

$$\hat{a} : 0 \to 1$$
$$\hat{\hat{a}} : 0 \to m_3$$
$$\hat{s} : 0 \to 1$$
$$\hat{\hat{s}} : 0 \to m_3$$

such that

$$
\begin{aligned}
A &\equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \hat{a} + \hat{\hat{a}}) \\
s &\equiv \mathbf{par}_{1+m_3} \cdot (\hat{s} + \hat{\hat{s}}) \\
\hat{a} \mid \hat{s} &\equiv L_1 \cdot u \\
\mathbf{ppar}_{m_3} \cdot (\hat{\hat{a}} + \hat{\hat{s}}) &\equiv e
\end{aligned}
$$

Applying Lemma 21 to $\hat{a} \mid \hat{s} \equiv L_1 \cdot u$ we have that there exist

m_{11} and m_{12} such that $m_{11} + m_{12} = m_1$

$\psi_i : m_1 \to m_{1i}$ for $i \in \{1, 2\}$ a partition

$L_{11} : m_{11} \to 1$ linear and deep

$L_{12} : m_{12} \to 1$ linear and deep

such that

$$
\begin{aligned}
\hat{s} &\equiv L_{11} \cdot \psi_1 \cdot u \\
\hat{a} &\equiv L_{12} \cdot \psi_2 \cdot u \\
L_1 &\equiv \mathbf{par}_2 \cdot (L_{11} + L_{12}) \cdot (\psi_1 \oplus \psi_2)
\end{aligned}
$$

There are m_{11} of the u in $\hat{s}$ and m_{12} of the u in $\hat{a}$. Putting things together, we have

$$
\begin{aligned}
A &\equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + L_{12} \cdot \psi_2 \cdot u + \hat{\hat{a}}) \\
s &\equiv \mathbf{par}_{1+m_3} \cdot (L_{11} \cdot \psi_1 \cdot u + \hat{\hat{s}}) \\
L &\equiv L_2 \cdot (\mathbf{par}_{2+m_3} \cdot (L_{11} + L_{12} + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot ((\psi_1 \oplus \psi_2) + \mathbf{id}_{m_3+m_2}) \cdot \pi
\end{aligned}
$$

(a) Case $m_3 = 1 \Rightarrow L_{11} \not\equiv \langle 0 \rangle_0$.

Letting $\phi \overset{def}{=} (\mathbf{id}_{m_{11}} + \mathbf{perm}_{m_3, m_{12}} + \mathbf{id}_{m_2}) \cdot (\psi_1 \oplus \psi_2 + \mathbf{id}_{m_3+m_2}) \cdot \pi$ and taking

$$
\begin{aligned}
v &= \psi_2 \cdot u \\
\hat{T} &= R \cdot \phi^{-1} \cdot (\psi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \hat{\hat{s}}) + \mathbf{id}_{m_{12}+m_2})
\end{aligned}
$$

we have clause 3.

We have to check

- $T \equiv R \cdot \phi^{-1} \cdot (\psi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \hat{s}) + \mathbf{id}_{m_{12}+m_2}) \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \hat{a}) + \psi_2 \cdot u + \mathbf{id}_{m_2})$

- $A \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + L_{12} \cdot \psi_2 \cdot u + \hat{a})$

There is a transition
$$s \xrightarrow{L_2 \cdot (\mathbf{par}_{2+m_3} + \mathbf{id}_{m_2}) \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_{12} + \mathbf{id}_{m_2})} R \cdot \phi^{-1} \cdot (\psi_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \hat{s}) + \mathbf{id}_{m_{12}+m_2})$$
as

$\langle m, L, R \rangle \in \mathcal{R}$

$m_{11}, m_{12} + m_2$ and m_3 such that $m_{11} + m_{12} + m_2 + m_3 = m$

$\phi : m \to m$ a permutation

$L_2 \cdot (\mathbf{par}_{2+m_3} \quad + \quad \mathbf{id}_{m_2}) \cdot (\mathbf{id}_1 \quad + \quad \mathbf{id}_{m_3} \quad + \quad L_{12} \quad + \quad \mathbf{id}_{m_2}) : 1 \quad + \quad m_3 \quad + \quad m_{12} \quad + \quad m_2 \to 1$ linear, deep in argument 1

$L_{11} : m_{11} \to 1$ linear and deep

$L_2 \cdot (\mathbf{par}_2 \cdot (\mathbf{id}_1 + L_{12}) + \mathbf{id}_{m_2}) : 1 + m_{12} + m_2 \to 1$ linear, deep in argument 1 and 1-separated

$\psi_1 \cdot u : 0 \to m_{11}$

$\hat{s} : 0 \to m_3$

and

- $L \equiv L_2 \cdot (\mathbf{par}_2 \cdot (\mathbf{id}_1 + L_{12}) + \mathbf{id}_{m_2}) \cdot (\mathbf{par}_{1+m_3} \cdot (L_{11} + \mathbf{id}_{m_3}) + \mathbf{id}_{m_{12}+m_2}) \cdot \phi$

- $s \equiv \mathbf{par}_{1+m_3} \cdot (L_{11} \cdot \psi_1 \cdot u + \hat{s})$

$$

PROOF By the definition of transitions there exist

$$
\begin{aligned}
&\langle m, L, R \rangle \in \mathcal{R} \\
&m_1, m_2 \text{ and } m_3 \text{ such that } m_1 + m_2 + m_3 = m \text{ and } n = m_3 + m_2 \\
&\pi : m \to m \text{ a permutation} \\
&q : 0 \to 1 \\
&L_1 : m_1 \to 1 \text{ linear and deep} \\
&L_2 : m_2 \to 1 \text{ linear and deep} \\
&u : 0 \to m_1 \\
&e : 0 \to m_3
\end{aligned}
$$

such that

$$L \equiv \mathbf{par}_{2+m_3} \cdot (L_1 + \mathbf{id}_{m_3} + L_2) \cdot \pi$$
$$A \cdot s \equiv \mathbf{par}_{2+m_3} \cdot (q + L_1 \cdot u + e)$$
$$T \equiv \mathbf{par}_2 \cdot (q + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}))$$
$$F \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)$$
$$m_3 = 0 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$$

By $F \not\equiv \mathbf{id}_1$ we also have $m_3 = 0 \Rightarrow L_2 \not\equiv \langle 0 \rangle_0$. The proof involves a number of cases, summarized below.

1 A deep.

    1a s is in q. Clause 1 holds.

    1b s is in $L_1 \cdot u$.

      1(b)i s is not deeply in any component of u.

        1(b)iA s and L have a non-trivial overlap. Clause 2 holds.

        1(b)iB s is in u. Clause 1 holds.

      1(b)ii s is deeply in a component of u. Clause 1 holds.

    1c s is in e. Clause 1 holds.

2 A shallow.

    2a s and L have a non-trivial overlap. Clause 3 holds.

    2b s is in q. Clause 1 holds.

We now consider the cases in detail.

1. Case A deep

   Applying Lemma 22 to $A \cdot s \equiv \mathbf{par}_{2+m_3} \cdot (q + L_1 \cdot u + e)$ we have that there exist

   $$\chi_1 : 2 + m_3 \to 1 \text{ and } \chi_2 : 2 + m_3 \to (2 + m_3 - 1) \text{ a partition}$$
   $$\hat{A} : 1 \to 1 \text{ linear and deep}$$
   $$\hat{a} : 0 \to (2 + m_3 - 1)$$

   such that

   $$\begin{aligned} A &\equiv \mathbf{par}_{2+m_3} \cdot (\hat{A} + \hat{a}) \\ \hat{A} \cdot s + \hat{a} &\equiv (\chi_1 \oplus \chi_2) \cdot (q + L_1 \cdot u + e) \end{aligned}$$

   (a) Case $\chi_1 = \langle {}_{-1} \rangle_{2+m_3}$.

   Here $\hat{A} \cdot s \equiv q$ and for all $z : 0 \to 1$ we have $\hat{a} \equiv (\chi_1 \oplus \chi_2) \cdot (z + L_1 \cdot u + e)$.

   Taking $H \overset{def}{=} \mathbf{par}_2 \cdot (\hat{A} + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}))$ we have clause 1.

   We have to check $H : 1 + n \to 1$, $T \equiv H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \overset{F}{\longrightarrow} H \cdot (\hat{s} + \mathbf{id}_n)$.
   There is a transition
   $$A \cdot \hat{s} \overset{F}{\longrightarrow} \mathbf{par}_2 \cdot (\hat{A} + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})) \cdot (\hat{s} + \mathbf{id}_n)$$
   as
   $$\langle m, L, R \rangle \in \mathcal{R}$$
   $$m_1, m_2 \text{ and } m_3 \text{ such that } m_1 + m_2 + m_3 = m \text{ and } n = m_3 + m_2$$
   $$\pi : m \to m \text{ a permutation}$$
   $$F : 1 + m_3 + m_2 \to 1 \text{ linear, shallow in argument 1, and not } \mathbf{id}_1$$
   $$\hat{A} \cdot \hat{s} : 0 \to 1$$
   $$L_1 : m_1 \to 1 \text{ linear and deep}$$
   $$L_2 : m_2 \to 1 \text{ linear and deep}$$
   $$u : 0 \to m_1$$
   $$e : 0 \to m_3$$
   and

- $L \equiv \mathbf{par}_{2+m_3} \cdot (L_1 + \mathbf{id}_{m_3} + L_2) \cdot \pi$
- $A \cdot \hat{s} \equiv \mathbf{par}_{2+m_3} \cdot (\hat{A} \cdot \hat{s} + L_1 \cdot u + e)$
- $\mathbf{par}_2 \cdot (\hat{A} + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})) \cdot (\hat{s} + \mathbf{id}_n) \equiv \mathbf{par}_2 \cdot (\hat{A} \cdot \hat{s} + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}))$
- $F \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)$
- $m_3 = 0 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$

(b) Case $\chi_1 = \langle {}_{\text{-}2} \rangle_{2+m_3}$.

Here $\hat{A} \cdot s \equiv L_1 \cdot u$ and $A \equiv \mathbf{par}_{2+m_3} \cdot (\hat{A} + q + e)$.

Applying Lemma 11 to $\hat{A} \cdot s \equiv L_1 \cdot u$ we have one of the following.

   i. (s is not deeply in any component of u) There exist

$$m_{11}, m_{12} \text{ and } m_{13} \text{ such that } m_{11} + m_{12} + m_{13} = m_1$$
$$\theta_1 : m_1 \to m_{11}, \ \theta_2 : m_1 \to m_{12} \text{ and } \theta_3 : m_1 \to m_{13} \text{ a partition}$$
$$L_{12} : 1 + m_{12} \to 1 \text{ linear and 1-separated}$$
$$L_{11} : m_{11} \to 1 \text{ linear and deep}$$
$$\hat{e}_1 : 0 \to m_{13}$$
$$\hat{e}_2 : 0 \to m_{13}$$

such that

$$
\begin{aligned}
\hat{A} &\equiv L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (\mathbf{id}_1 + \hat{e}_2) + \theta_2 \cdot u) \\
s &\equiv \mathbf{par}_{1+m_{13}} \cdot (L_{11} \cdot \theta_1 \cdot u + \hat{e}_1) \\
L_1 &\equiv L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (L_{11} + \mathbf{id}_{m_{13}}) + \mathbf{id}_{m_{12}}) \cdot (\theta_1 \oplus \theta_3 \oplus \theta_2) \\
\theta_3 \cdot u &\equiv \mathbf{ppar}_{m_{13}} \cdot (\hat{e}_1 + \hat{e}_2)
\end{aligned}
$$

There are m_{11} of the u in s, m_{12} of the u in $\hat{A}$ and m_{13} of the u potentially overlapping $\hat{A}$ and s. The latter are split into $\hat{e}_1$, in s, and $\hat{e}_2$, in $\hat{A}$.

   A. Case $m_{13} = 1 \Rightarrow L_{11} \not\equiv \langle 0 \rangle_0$.

   Note that by $\hat{A}$ deep we know L_{12} is deep in its first argument and by L_1 deep we know L_{12} is deep in its other arguments. Letting $\phi \overset{def}{=} ((\theta_1 \oplus \theta_3 \oplus \theta_2) + \mathbf{id}_{m_3 + m_2}) \cdot \pi$ and taking

$$
\begin{aligned}
v_3 &= \hat{e}_2 \\
v_2 &= \theta_2 \cdot u \\
\hat{T} &= R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_{13}} \cdot (\mathbf{id}_{m_{13}} + \hat{e}_1) + \mathbf{id}_{m_{12} + m_3 + m_2})
\end{aligned}
$$

   we have clause 2 of the conclusion.
   We have to check
   - $T \equiv \mathbf{par}_2 \cdot (q + R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_{13}} \cdot (\mathbf{id}_{m_{13}} + \hat{e}_1) + \mathbf{id}_{m_{12} + m_3 + m_2}) \cdot (\hat{e}_2 + \theta_2 \cdot u + \mathbf{ppar}_{m_3} \cdot (e + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}))$
   - $A \equiv \mathbf{par}_{2+m_3} \cdot (q + L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (\mathbf{id}_1 + \hat{e}_2) + \theta_2 \cdot u) + e)$

   There is a transition
   $$s \xrightarrow{\mathbf{par}_{2+m_3} \cdot (L_{12} + \mathbf{id}_{m_3} + L_2) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12} + m_3 + m_2})} R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_{13}} \cdot (\mathbf{id}_{m_{13}} + \hat{e}_1) + \mathbf{id}_{m_{12} + m_3 + m_2})$$

   as
   $\langle m, L, R \rangle \in \mathcal{R}$
   $m_{11}, m_{12} + m_3 + m_2$ and m_{13} such that $m_{11} + m_{12} + m_3 + m_2 + m_{13} = m$
   $\phi : m \to m$ a permutation
   $\mathbf{par}_{2+m_3} \cdot (L_{12} + \mathbf{id}_{m_3} + L_2) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12} + m_3 + m_2}) : 1 + m_{13} + m_{12} + m_3 + m_2 \to 1$ linear, deep in argument 1
   $L_{11} : m_{11} \to 1$ linear and deep

$\mathbf{par}_{2+m_3}\cdot(L_{12} \quad + \quad \mathbf{id}_{m_3} \quad + \quad L_2):1 \quad + \quad m_{12} \quad + \quad m_3 \quad + \quad m_2 \to 1$ linear, deep in argument 1 and 1-separated

$\theta_1 \cdot u : 0 \to m_{11}$

$\hat{e}_1 : 0 \to m_{13}$

and

- $L \equiv \mathbf{par}_{2+m_3}\cdot(L_{12}+\mathbf{id}_{m_3}+L_2)\cdot(\mathbf{par}_{1+m_{13}}\cdot(L_{11}+\mathbf{id}_{m_{13}})+\mathbf{id}_{m_{12}+m_3+m_2})\cdot\phi$
- $s \equiv \mathbf{par}_{1+m_{13}}\cdot(L_{11}\cdot\theta_1\cdot u+\hat{e}_1)$
- $R\cdot\phi^{-1}\cdot(\theta_1\cdot u + \mathbf{ppar}_{m_{13}}\cdot(\mathbf{id}_{m_{13}} + \hat{e}_1) + \mathbf{id}_{m_{12}+m_3+m_2}) \equiv R\cdot\phi^{-1}\cdot(\theta_1\cdot u + \mathbf{ppar}_{m_{13}}\cdot(\mathbf{id}_{m_{13}} + \hat{e}_1) + \mathbf{id}_{m_{12}+m_3+m_2})$
- $\mathbf{par}_{2+m_3}\cdot(L_{12}+\mathbf{id}_{m_3}+L_2)\cdot(\mathbf{par}_{1+m_{13}}+\mathbf{id}_{m_{12}+m_3+m_2}) \equiv \mathbf{par}_{2+m_3}\cdot(L_{12}+\mathbf{id}_{m_3}+L_2)\cdot(\mathbf{par}_{1+m_{13}}+\mathbf{id}_{m_{12}+m_3+m_2})$
- $m_{13}=1 \Rightarrow L_{11}\not\equiv\langle 0\rangle_0$

B. Case $m_{13}=1 \wedge L_{11}\equiv\langle 0\rangle_0$.

Here $s\equiv\hat{e}_1$ and $L_1\equiv L_{12}\cdot(\theta_1\oplus\theta_3\oplus\theta_2)$. Also $m_{11}=0$ so $\theta_1\cdot u\equiv\langle\rangle_0$.

Taking $H\overset{def}{=}\mathbf{par}_2\cdot(q+R\cdot\pi^{-1}\cdot((\theta_1\oplus\theta_3\oplus\theta_2)^{-1}\cdot(\theta_1\cdot u+\mathbf{par}_2\cdot(\mathbf{id}_1+\hat{e}_2)+\theta_2\cdot u)+\mathbf{ppar}_{m_3}\cdot(\mathbf{id}_{m_3}+e)+\mathbf{id}_{m_2}))$ we have clause 1.

We have to check $H:1+n\to 1$, $T\equiv H\cdot(s+\mathbf{id}_n)$ and for all $\hat{s}:0\to 1$ we have $A\cdot\hat{s}\overset{F}{\longrightarrow}H\cdot(\hat{s}+\mathbf{id}_n)$. There is a transition

$A\cdot\hat{s}\overset{F}{\longrightarrow}\mathbf{par}_2\cdot(q + R\cdot\pi^{-1}\cdot((\theta_1\oplus\theta_3\oplus\theta_2)^{-1}\cdot(\theta_1\cdot u + \mathbf{par}_2\cdot(\mathbf{id}_1 + \hat{e}_2) + \theta_2\cdot u) + \mathbf{ppar}_{m_3}\cdot(\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}))\cdot(\hat{s}+\mathbf{id}_n)$

$q : 0 \to 1$

$L_1 : m_1 \to 1$ linear and deep

$L_2 : m_2 \to 1$ linear and deep

$(\theta_1 \oplus \theta_2)^{-1} \cdot (J \cdot \hat{s} + \theta_2 \cdot u) : 0 \to m_1$

$e : 0 \to m_3$

and

- $L \equiv \mathbf{par}_{2+m_3} \cdot (L_1 + \mathbf{id}_{m_3} + L_2) \cdot \pi$
- $A \cdot \hat{s} \equiv \mathbf{par}_{2+m_3} \cdot (q + L_1 \cdot (\theta_1 \oplus \theta_2)^{-1} \cdot (J \cdot \hat{s} + \theta_2 \cdot u) + e)$
- $\mathbf{par}_2 \cdot (q + R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J + \theta_2 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})) \cdot (\hat{s} + \mathbf{id}_n) \equiv$
  $\mathbf{par}_2 \cdot (q + R \cdot \pi^{-1} \cdot ((\theta_1 \oplus \theta_2)^{-1} \cdot (J \cdot \hat{s} + \theta_2 \cdot u) + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}))$
- $F \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)$
- $m_3 = 0 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$

(**c**) Case $\chi_1 = \langle {}_{-k} \rangle_{2+m_3}$ for $k \geq 3$.

Here $\hat{A} \cdot s$ is one component of e and q and $L_1 \cdot u$ are two components of $\hat{a}$.

Take $\psi_1 : m_3 \to 1$ and $\psi_2 : m_3 \to (m_3 - 1)$ such that

$$
\begin{aligned}
\hat{A} \cdot s &\equiv \psi_1 \cdot e \\
A &\equiv \mathbf{par}_{2+m_3} \cdot (q + L_1 \cdot u + \hat{A} + \psi_2 \cdot e) \\
e &\equiv (\psi_1 \oplus \psi_2)^{-1} \cdot (\hat{A} \cdot s + \psi_2 \cdot e)
\end{aligned}
$$

Taking $H \stackrel{def}{=} \mathbf{par}_2 \cdot (q + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot ((\psi_1 \oplus \psi_2)^{-1} \cdot (\hat{A} + \psi_2 \cdot e) + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}))$ we have clause 1.

We have to check $H : 1 + n \to 1$, $T \equiv H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \xrightarrow{F} H \cdot (\hat{s} + \mathbf{id}_n)$. There is a transition

$$A \cdot \hat{s} \xrightarrow{F} \mathbf{par}_2 \cdot (q + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot ((\psi_1 \oplus \psi_2)^{-1} \cdot (\hat{A} + \psi_2 \cdot e) + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2})) \cdot (\hat{s} + \mathbf{id}_n)$$

as

$\langle m, L, R \rangle \in \mathcal{R}$

m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$ and $n = m_3 + m_2$

$\pi : m \to m$ a permutation

$F : 1 + m_3 + m_2 \to 1$ linear, shallow in argument 1, and not $\mathbf{id}_1$

$q : 0 \to 1$

$L_1 : m_1 \to 1$ linear and deep

$L_2 : m_2 \to 1$ linear and deep

$u : 0 \to m_1$

$(\psi_1 \oplus \psi_2)^{-1} \cdot (\hat{A} \cdot \hat{s} + \psi_2 \cdot e) : 0 \to m_3$

and

- $L \equiv \mathbf{par}_{2+m_3} \cdot (L_1 + \mathbf{id}_{m_3} + L_2) \cdot \pi$
- $A \cdot \hat{s} \equiv \mathbf{par}_{2+m_3} \cdot (q + L_1 \cdot u + (\psi_1 \oplus \psi_2)^{-1} \cdot (\hat{A} \cdot \hat{s} + \psi_2 \cdot e))$
- $\mathbf{par}_2 \cdot (q + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot ((\psi_1 \oplus \psi_2)^{-1} \cdot (\hat{A} + \psi_2 \cdot e) + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2})) \cdot (\hat{s} + \mathbf{id}_n) \equiv$
  $\mathbf{par}_2 \cdot (q + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + (\psi_1 \oplus \psi_2)^{-1} \cdot (\hat{A} \cdot \hat{s} + \psi_2 \cdot e)) + \mathbf{id}_{m_2}))$
- $F \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)$
- $m_3 = 0 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$

2. Case A shallow.

Applying Lemma 23 to $A \cdot s \equiv \mathbf{par}_{2+m_3} \cdot (q + L_1 \cdot u + e)$ we have that there exist

$$
\begin{array}{lll}
a' : 0 \to 1 & a'' : 0 \to 1 & a''' : 0 \to m_3 \\
s' : 0 \to 1 & s'' : 0 \to 1 & s''' : 0 \to m_3
\end{array}
$$

such that

$$
\begin{array}{rcl}
A & \equiv & \mathbf{par}_{1+2+m_3} \cdot (\mathbf{id}_1 + a' + a'' + a''') \\
s & \equiv & \mathbf{par}_{2+m_3} \cdot (s' + s'' + s''') \\
q & \equiv & a' \,|\, s' \\
L_1 \cdot u & \equiv & a'' \,|\, s'' \\
e & \equiv & \mathbf{ppar}_{m_3} \cdot (a''' + s''')
\end{array}
$$

Applying Lemma 21 to $L_1 \cdot u \equiv a'' \,|\, s''$ there exist

m_{11} and m_{12} such that $m_{11} + m_{12} = m_1$
$\theta_i : m_1 \to m_{1i}$ for $i \in \{1, 2\}$ a partition
$L_{11} : m_{11} \to 1$ linear and deep
$L_{12} : m_{12} \to 1$ linear and deep

such that

$$
\begin{array}{rcl}
s'' & \equiv & L_{11} \cdot \theta_1 \cdot u \\
a'' & \equiv & L_{12} \cdot \theta_2 \cdot u \\
L_1 & \equiv & \mathbf{par}_2 \cdot (L_{11} + L_{12}) \cdot (\theta_1 \oplus \theta_2)
\end{array}
$$

There are m_{11} of the u in s'' and m_{12} of the u in a''. Putting things together, we have

$$
\begin{array}{rcl}
A & \equiv & \mathbf{par}_{1+2+m_3} \cdot (\mathbf{id}_1 + a' + L_{12} \cdot \theta_2 \cdot u + a''') \\
s & \equiv & \mathbf{par}_{2+m_3} \cdot (s' + L_{11} \cdot \theta_1 \cdot u + s''') \\
L & \equiv & \mathbf{par}_{3+m_3} \cdot (L_{11} + L_{12} + \mathbf{id}_{m_3} + L_2) \cdot (\theta_1 \oplus \theta_2 + \mathbf{id}_{m_3+m_2}) \cdot \pi
\end{array}
$$

(a) Case $m_3 = 0 \Rightarrow L_{11} \not\equiv \langle 0 \rangle_0$.

Letting $\phi \overset{def}{=} (\mathbf{id}_{m_{11}} + \mathbf{perm}_{m_3,m_{12}} + \mathbf{id}_{m_2}) \cdot (\theta_1 \oplus \theta_2 + \mathbf{id}_{m_3+m_2}) \cdot \pi$ and taking

$$
\begin{array}{rcl}
v_2 & = & \theta_2 \cdot u \\
\hat{T} & = & \mathbf{par}_2 \cdot (s' + R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + s''') + \mathbf{id}_{m_{12}+m_2}))
\end{array}
$$

we have clause 3 of the conclusion.

We have to check

- $F \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)$
- $T \equiv \mathbf{par}_2 \cdot (a' + \mathbf{par}_2 \cdot (s' + R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + s''') + \mathbf{id}_{m_{12}+m_2})) \cdot (\mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + a''') + \theta_2 \cdot u + \mathbf{id}_{m_2}))$
- $A \equiv \mathbf{par}_{1+2+m_3} \cdot (\mathbf{id}_1 + a' + L_{12} \cdot \theta_2 \cdot u + a''')$

There is a transition

$$
s \overset{\mathbf{par}_{3+m_3} \cdot (\mathbf{id}_1+\mathbf{id}_{m_3}+L_{12}+L_2)}{\longrightarrow} \mathbf{par}_2 \cdot (s' + R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + s''') + \mathbf{id}_{m_{12}+m_2}))
$$

as

$\langle m, L, R \rangle \in \mathcal{R}$
$m_{11}, m_{12} + m_2$ and m_3 such that $m_{11} + m_{12} + m_2 + m_3 = m$
$\phi : m \to m$ a permutation
$\mathbf{par}_{3+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_{12} + L_2) : 1 + m_3 + m_{12} + m_2 \to 1$ linear, shallow in argument 1, and not $\mathbf{id}_1$
$s' : 0 \to 1$

$L_{11} : m_{11} \to 1$ linear and deep
$\mathbf{par}_2 \cdot (L_{12} + L_2) : m_{12} + m_2 \to 1$ linear and deep
$\theta_1 \cdot u : 0 \to m_{11}$
$s''' : 0 \to m_3$

and

- $L \equiv \mathbf{par}_{2+m_3} \cdot (L_{11} + \mathbf{id}_{m_3} + \mathbf{par}_2 \cdot (L_{12} + L_2)) \cdot \phi$
- $s \equiv \mathbf{par}_{2+m_3} \cdot (s' + L_{11} \cdot \theta_1 \cdot u + s''')$
- $\mathbf{par}_2 \cdot (s' + R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + s''') + \mathbf{id}_{m_{12}+m_2})) \equiv \mathbf{par}_2 \cdot (s' + R \cdot \phi^{-1} \cdot (\theta_1 \cdot u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + s''') + \mathbf{id}_{m_{12}+m_2}))$
- $\mathbf{par}_{3+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_{12} + L_2) \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + \mathbf{par}_2 \cdot (L_{12} + L_2))$
- $m_3 = 0 \Rightarrow L_{11} \not\equiv \langle 0 \rangle_0$

(b) Case $m_3 = 0 \wedge L_{11} \equiv \langle 0 \rangle_0$

Taking $H \stackrel{def}{=} \mathbf{par}_2 \cdot (\mathbf{par}_2 \cdot (a' + \mathbf{id}_1) + R \cdot \pi^{-1} \cdot (u + \mathbf{id}_0 + \mathbf{id}_{m_2}))$ we have clause 1.

We have to check $H : 1 + n \to 1$, $T \equiv H \cdot (s + \mathbf{id}_n)$ and for all $\hat{s} : 0 \to 1$ we have $A \cdot \hat{s} \xrightarrow{F} H \cdot (\hat{s} + \mathbf{id}_n)$.
There is a transition
$A \cdot \hat{s} \xrightarrow{F} \mathbf{par}_2 \cdot (\mathbf{par}_2 \cdot (a' + \mathbf{id}_1) + R \cdot \pi^{-1} \cdot (u + \mathbf{id}_0 + \mathbf{id}_{m_2})) \cdot (\hat{s} + \mathbf{id}_n)$
as
$\langle m, L, R \rangle \in \mathcal{R}$
m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$ and $n = m_3 + m_2$
$\pi : m \to m$ a permutation
$F : 1 + m_3 + m_2 \to 1$ linear, shallow in argument 1, and not $\mathbf{id}_1$
$a' \mid \hat{s} : 0 \to 1$
$L_1 : m_1 \to 1$ linear and deep
$L_2 : m_2 \to 1$ linear and deep
$u : 0 \to m_1$
$\mathbf{id}_0 : 0 \to m_3$

and

- $L \equiv \mathbf{par}_{2+m_3} \cdot (L_1 + \mathbf{id}_{m_3} + L_2) \cdot \pi$
- $A \cdot \hat{s} \equiv \mathbf{par}_{2+m_3} \cdot (a' \mid \hat{s} + L_1 \cdot u + \mathbf{id}_0)$
- $\mathbf{par}_2 \cdot (\mathbf{par}_2 \cdot (a' + \mathbf{id}_1) + R \cdot \pi^{-1} \cdot (u + \mathbf{id}_0 + \mathbf{id}_{m_2})) \cdot (\hat{s} + \mathbf{id}_n) \equiv \mathbf{par}_2 \cdot (a' \mid \hat{s} + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + \mathbf{id}_0) + \mathbf{id}_{m_2}))$
- $F \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2)$
- $m_3 = 0 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$

$\square$

C.3   Backwards Lemmas

The five lemmas in this subsection are approximate converses to those in Section C.2. The first shows that if $s \xrightarrow{F} T$ then $F \cdot (s + v)$ has a reduction to $T \cdot v$. The other four show that if $s \xrightarrow{F \cdot G} T$ then s, in a context constructed from G, has a transition with label F. This is done for F and G deep and shallow in their first arguments.

LEMMA 27 *If* $s \xrightarrow{F} T$ *for* $F : 1 + n \to 1$ *then for all* $v : 0 \to n$ *we have* $F \cdot (s + v) \xrightarrow{\quad} T \cdot v$.

PROOF There are three cases of the form of F.

1. For $F \equiv \mathbf{id}_1$ the conclusion is trivial.

2. For F deep in argument 1: there exist

$$\langle m, L, R \rangle \in \mathcal{R}$$
$$m_1, m_2 \text{ and } m_3 \text{ such that } m_1 + m_2 + m_3 = m \text{ and } n = m_3 + m_2$$
$$\pi : m \to m \text{ a permutation}$$
$$L_1 : m_1 \to 1 \text{ linear and deep}$$
$$L_2 : 1 + m_2 \to 1 \text{ linear, deep in argument 1 and 1-separated}$$
$$u : 0 \to m_1$$
$$e : 0 \to m_3$$

such that

$$L \equiv L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_1 + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot \pi$$
$$s \equiv \mathbf{par}_{1+m_3} \cdot (L_1 \cdot u + e)$$
$$T \equiv R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})$$
$$F \equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})$$
$$m_3 = 1 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$$

We check

$$F \cdot (s + v)$$
$$\equiv L_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (\mathbf{par}_{1+m_3} \cdot (L_1 \cdot u + e) + v)$$
$$\equiv \mathbf{id}_1 \cdot \left(L_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_1 + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot \pi \right) \cdot \left(\pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (e + \theta_3 \cdot v) + \theta_2 \cdot v) \right)$$
$$\equiv \mathbf{id}_1 \cdot L \cdot \left(\pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (e + \theta_3 \cdot v) + \theta_2 \cdot v) \right)$$
$$T \cdot v$$
$$\equiv R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2}) \cdot (\theta_3 \cdot v + \theta_2 \cdot v)$$
$$\equiv \mathbf{id}_1 \cdot R \cdot \left(\pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (e + \theta_3 \cdot v) + \theta_2 \cdot v) \right)$$

where $\theta_3 : m_3 + m_2 \to m_3$ and $\theta_2 : m_3 + m_2 \to m_2$ are the obvious projections.

3. For F shallow in argument 1 and $F \not\equiv \mathbf{id}_1$: there exist

$$\langle m, L, R \rangle \in \mathcal{R}$$
$$m_1, m_2 \text{ and } m_3 \text{ such that } m_1 + m_2 + m_3 = m \text{ and } n = m_3 + m_2$$
$$\pi : m \to m \text{ a permutation}$$
$$q : 0 \to 1$$
$$L_1 : m_1 \to 1 \text{ linear and deep}$$
$$L_2 : m_2 \to 1 \text{ linear and deep}$$
$$u : 0 \to m_1$$
$$e : 0 \to m_3$$

such that

$$
\begin{aligned}
&L \equiv \mathbf{par}_{2+m_3} \cdot (L_1 + \mathbf{id}_{m_3} + L_2) \cdot \pi \\
&s \equiv \mathbf{par}_{2+m_3} \cdot (q + L_1 \cdot u + e) \\
&T \equiv \mathbf{par}_2 \cdot (q + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})) \\
&F \equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2) \\
&m_3 = 0 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0
\end{aligned}
$$

We check

$$
\begin{aligned}
&F \cdot (s + v) \\
&\equiv \mathbf{par}_{2+m_3} \cdot (\mathbf{id}_1 + \mathbf{id}_{m_3} + L_2) \cdot (\mathbf{par}_{2+m_3} \cdot (q + L_1 \cdot u + e) + v) \\
&\equiv \mathbf{par}_2 \cdot (q + \mathbf{id}_1) \cdot \mathbf{par}_{2+m_3} \cdot (L_1 + \mathbf{id}_{m_3} + L_2) \cdot \pi \cdot \left(\pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (e + \theta_3 \cdot v) + \theta_2 \cdot v) \right) \\
&\equiv \mathbf{par}_2 \cdot (q + \mathbf{id}_1) \cdot L \cdot \left(\pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (e + \theta_3 \cdot v) + \theta_2 \cdot v) \right) \\
&T \cdot v \\
&\equiv \mathbf{par}_2 \cdot (q + R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (\mathbf{id}_{m_3} + e) + \mathbf{id}_{m_2})) \cdot (\theta_3 \cdot v + \theta_2 \cdot v) \\
&\equiv \mathbf{par}_2 \cdot (q + \mathbf{id}_1) \cdot R \cdot \left(\pi^{-1} \cdot (u + \mathbf{ppar}_{m_3} \cdot (e + \theta_3 \cdot v) + \theta_2 \cdot v) \right)
\end{aligned}
$$

where $\theta_3 : m_3 + m_2 \to m_3$ and $\theta_2 : m_3 + m_2 \to m_2$ are the obvious projections.

$\square$

LEMMA 28 *If* $s \xrightarrow{\hat{L}_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (L_{12} + \mathbf{id}_{m_3 + m_2}) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12} + m_3 + m_2})} \hat{T}$*, where*

$$m_{13} \geq 0 \text{ and } m_{12} \geq 0 \text{ and } m_2 \geq 0 \text{ and } m_3 \geq 0$$
$$\hat{L}_2 : 1 + m_2 \to 1 \text{ linear, deep in } 1 \text{ and } 1\text{-separated}$$
$$L_{12} : 1 + m_{12} \to 1 \text{ linear, deep and } 1\text{-separated}$$
$$\hat{T} : m_{13} + m_{12} + m_3 + m_2 \to 1$$

then for all

$$v_3 : 0 \to m_{13}$$
$$v_2 : 0 \to m_{12}$$
$$e : 0 \to m_3$$

we have

$$\mathbf{par}_{1+m_3} \cdot (L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (s+v_3)+v_2)+e) \xrightarrow{\hat{L}_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})} \hat{T} \cdot (v_3+v_2+\mathbf{ppar}_{m_3} \cdot (e+\mathbf{id}_{m_3})+\mathbf{id}_{m_2})$$

PROOF By the definition of transitions there exist

$\langle m, L, R \rangle \in \mathcal{R}$
n_1, n_2 and n_3 such that $n_1 + n_2 + n_3 = m$ and $m_{13} + m_{12} + m_3 + m_2 = n_3 + n_2$
$\pi : m \to m$ a permutation
$L_1 : n_1 \to 1$ linear and deep
$L_2 : 1 + n_2 \to 1$ linear, deep in argument 1 and 1-separated
$u : 0 \to n_1$
$\hat{e} : 0 \to n_3$

such that

$L \equiv L_2 \cdot (\mathbf{par}_{1+n_3} \cdot (L_1 + \mathbf{id}_{n_3}) + \mathbf{id}_{n_2}) \cdot \pi$
$s \equiv \mathbf{par}_{1+n_3} \cdot (L_1 \cdot u + \hat{e})$
$\hat{T} \equiv R \cdot \pi^{-1} \cdot (u + \mathbf{ppar}_{n_3} \cdot (\mathbf{id}_{n_3} + \hat{e}) + \mathbf{id}_{n_2})$
$\hat{L}_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (L_{12} + \mathbf{id}_{m_3 + m_2}) \cdot (\mathbf{par}_{1+m_{13}} + \mathbf{id}_{m_{12} + m_3 + m_2}) \equiv L_2 \cdot (\mathbf{par}_{1+n_3} + \mathbf{id}_{n_2})$
$n_3 = 1 \Rightarrow L_1 \not\equiv \langle 0 \rangle_0$

From the 4th equation and the fact that L_{12} and L_2 are deep in 1 and 1-separated, we have:

$$\begin{aligned}
m_{13} &= n_3 \\
m_{12} + m_3 + m_2 &= n_2 \\
m - (m_{13} + m_{12} + m_3 + m_2) &= n_1 \\
\hat{L}_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) \cdot (L_{12} + \mathbf{id}_{m_3 + m_2}) &\equiv L_2
\end{aligned}$$

Let $m_1 \stackrel{def}{=} m - (m_3 + m_2)$. There is a transition

$$\mathbf{par}_{1+m_3} \cdot (L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (s+v_3)+v_2)+e) \xrightarrow{\hat{L}_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2})} \hat{T} \cdot (v_3+v_2+\mathbf{ppar}_{m_3} \cdot (e+\mathbf{id}_{m_3})+\mathbf{id}_{m_2})$$

as

$\langle m, L, R \rangle \in \mathcal{R}$
m_1, m_2 and m_3 such that $m_1 + m_2 + m_3 = m$ and $m_3 + m_2 = m_3 + m_2$
$\pi : m \to m$ a permutation
$\hat{L}_2 \cdot (\mathbf{par}_{1+m_3} + \mathbf{id}_{m_2}) : 1 + m_3 + m_2 \to 1$ linear, deep in argument 1
$L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (L_1 + \mathbf{id}_{m_{13}}) + \mathbf{id}_{m_{12}}) : m_1 \to 1$ linear and deep
$\hat{L}_2 : 1 + m_2 \to 1$ linear, deep in argument 1 and 1-separated
$(u + \mathbf{ppar}_{m_{13}} \cdot (\hat{e} + v_3) + v_2) : 0 \to m_1$
$e : 0 \to m_3$

and

- $L \equiv \hat{L}_2 \cdot (\mathbf{par}_{1+m_3} \cdot (L_{12} \cdot (\mathbf{par}_{1+m_{13}} \cdot (L_1 + \mathbf{id}_{m_{13}}) + \mathbf{id}_{m_{12}}) + \mathbf{id}_{m_3}) + \mathbf{id}_{m_2}) \cdot \pi$
