APPENDIX

Publications related to the grant are as follows:
[1] gives an overview of the work.
[2]discusses event federation.
[3, 4] describe Oasis access control and its use of an active, event-driven, middleware platform.
[6, 5, 7, 8, 9] are about using an event-driven paradigm in the e-commerce application area.
[10, 11, 12] include the use of the CEA *publish, subscribe, notify* paradigm in an active home project in the Computer Laboratory. The event service (Romvets) is part of an embedded operating system.
[13, 14, 15, 16] have been submitted for publication.
[16] describes an active policy store implemented on Postgres. The active database triggers are events which both feed into the monitoring of security conditions and initiate the propagation of policy changes throughout the system.
[17] is the thesis of the attached PhD student who is currently writing up. [18, 19] are theses in the area of the grant.
[20, 21, 22, 23] carry the ODMG/ODL/OQL research forward.
[24, 25, 26, 27, 28, 29, 30, 31] are some of the projects in the area of the grant carried out by final year undergraduate students, several of whom have gone on to work in middleware.
