

String diagrams for higher mathematics with `wiggle.py`

Simon Burton

April 20th, 2023

simon.burton@quantinuum.com

Outline

- (1) String diagrams for higher mathematics
- (2) with `wiggle.py`

Outline

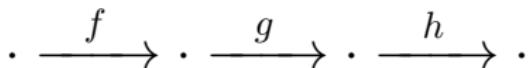

- (1) String diagrams for higher mathematics
 - (1a) ~~all about associativity, unitality, etc.~~
- (2) with `wiggle.py`

Outline

- (1) String diagrams for higher mathematics
 - (1a) ~~all about associativity, unitality, etc.~~
- (2) with `wiggle.py`
 - (2a) demo
 - (2b) implementation notes

A monoid

“... and then ...”

Arrow diagram

String diagram

A category

“Multi-coloured monoid”

$$A \xrightarrow{f} B \xrightarrow{g} C \xrightarrow{h} D$$

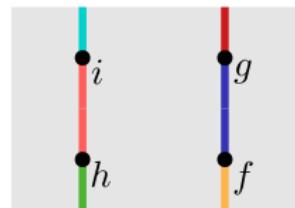

Arrow diagram

String diagram

A monoidal category

“... and then ..., but also...”

$$A \otimes B \xrightarrow{h \otimes f} C \otimes D \xrightarrow{i \otimes g} E \otimes F$$

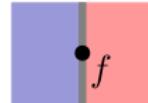

Arrow diagram

String diagram

A bicategory

“multi-coloured monoidal category”

$n \xleftarrow{f \uparrow} m$

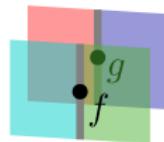

Arrow diagram String diagram

A monoidal bicategory

“... and then ..., but also..., meanwhile...”

$$m \otimes o \xleftarrow[f \otimes g \uparrow\downarrow]{ } l \otimes n$$

Arrow diagram

String diagram

Commutativity

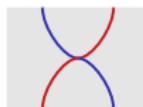

from “and then” to “and”

$$\begin{array}{ccc} \bullet_h & = & \bullet_g \\ \bullet_g & & \bullet_h \\ \bullet_f & & \bullet_f \end{array}$$

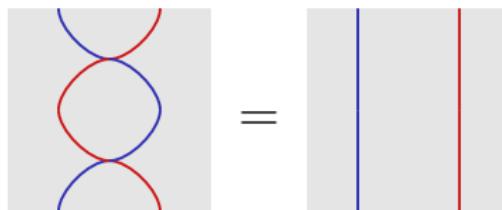

Commutative monoids

Higher commutativity

Equations become morphisms:

That satisfy further equations:

Higher equality

In a given 2-category, an *equivalence* between objects  and  is a pair of 1-cells  ,  and isomorphisms  ,  :

$$\begin{array}{c} \text{grey square with red semi-circle at top} \\ \text{grey square with red semi-circle at bottom} \end{array} = \begin{array}{c} \text{grey vertical bar with red middle} \\ | \\ \text{red vertical bar with grey middle} \end{array}, \quad \begin{array}{c} \text{grey square with red circle} \end{array} = \begin{array}{c} \text{grey square} \end{array},$$

$$\begin{array}{c} \text{red square with grey semi-circle at top} \\ \text{red square with grey semi-circle at bottom} \end{array} = \begin{array}{c} \text{red vertical bar with grey middle} \\ | \\ \text{grey vertical bar with red middle} \end{array}, \quad \begin{array}{c} \text{red square with grey circle} \end{array} = \begin{array}{c} \text{red square} \end{array}.$$

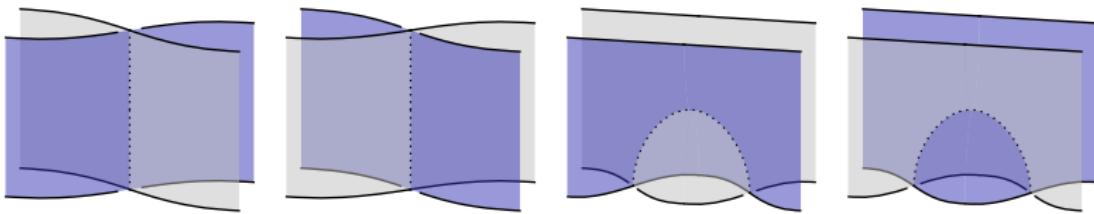

Adjointness

An *adjoint pair* of 1-cells is a *left adjoint*  and a *right adjoint*  such that there exists 2-cells  and  called the *unit* and *counit* respectively, with

$$\text{unit} = \begin{array}{c} \uparrow \\ \downarrow \end{array}, \quad \text{counit} = \begin{array}{c} \downarrow \\ \uparrow \end{array}.$$

Higher commutativity

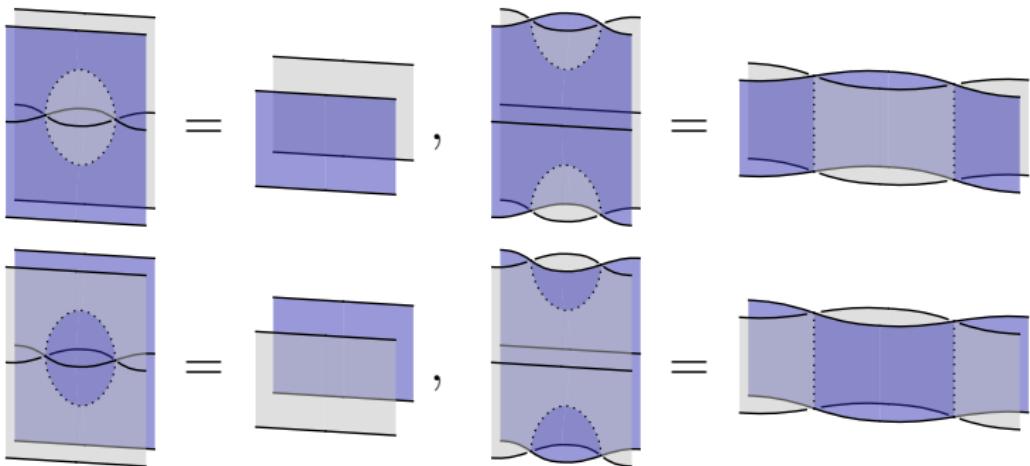

Braided monoidal bicategory has:

& these form an adjoint equivalence...

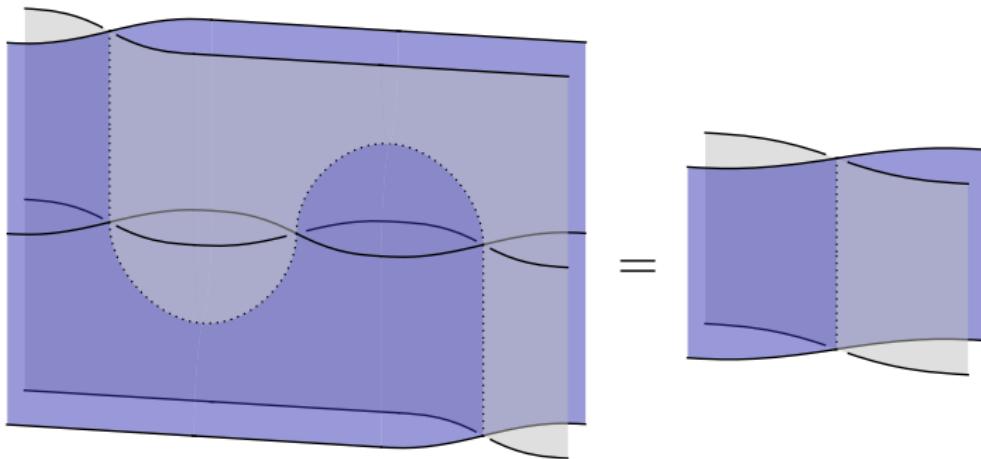

Higher commutativity

Equivalence:

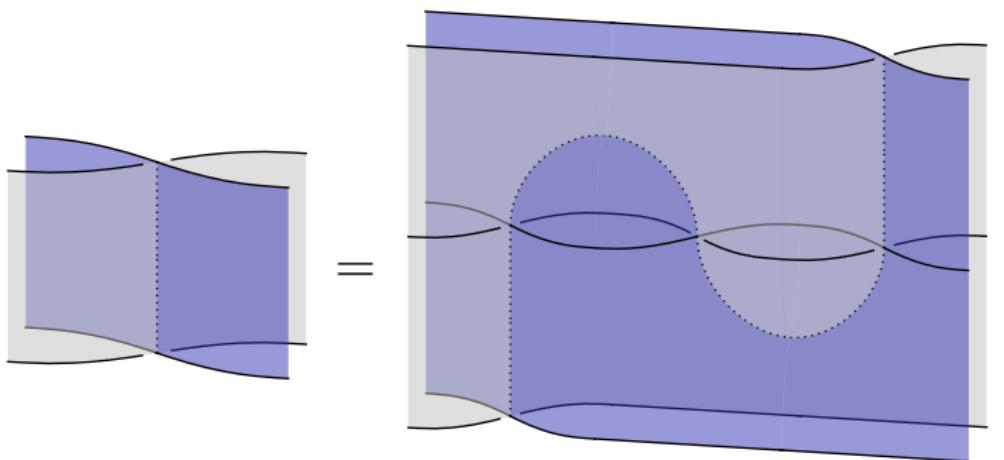

Higher commutativity

Adjointness:

Higher commutativity

Adjointness:

demo of wiggle.py

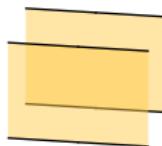

demo of wiggle.py

```
from huygens.namespace import color  
from huygens.wiggle import Cell0, Cell1, Cell2  
yellow = color.rgb(1.0, 0.80, 0.3, 0.5)  
Cell0("m", fill=yellow)
```

demo of wiggle.py

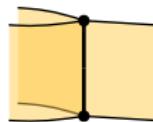

```
from huygens.namespace import color  
from huygens.wiggle import Cell0, Cell1, Cell2  
yellow = color.rgb(1.0, 0.80, 0.3, 0.5)  
m = Cell0("m", fill=yellow)  
m@m
```

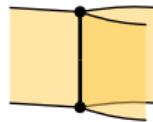

demo of wiggle.py

```
m = Cell0("m", fill=yellow)
```

```
Cell1(m@m, m)
```

```
Cell1(m, m@m)
```

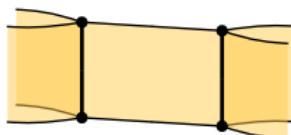

demo of wiggle.py

```
m = Cell0("m", fill=yellow)
```

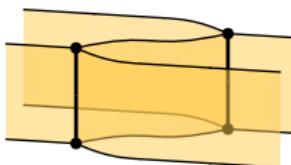

```
mm_m = Cell1(m@m, m)
```

```
m_mm = Cell1(m, m@m)
```

```
mm_m << m_mm
```

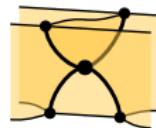

```
(m_mm @ m) << (m @ mm_m)
```

demo of wiggle.py

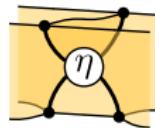

```
m = Cell0("m", fill=yellow)
mm_m = Cell1(m@m, m)
m_mm = Cell1(m, m@m)
src = mm_m << m_mm
tgt = (m_mm @ m) << (m @ mm_m)
Cell2(tgt, src)
```

demo of wiggle.py

...

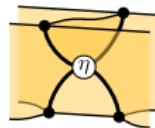

```
from huygens.namespace import *
p = path.circle(0, 0, 0.2)
cvs = Canvas()
cvs.fill(p, [white]).stroke(p).
cvs.text(0, 0, r"\eta", st_center)
Cell2(tgt, src, pip_cvs=cvs)
```

demo of wiggle.py

...

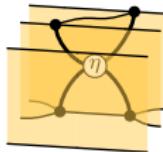

```
from huygens.namespace import *
p = path.circle(0, 0, 0.2)
cvs = Canvas().scale(0.6)
cvs.fill(p, [white]).stroke(p).
cvs.text(0, 0, r"\eta", st_center)
Cell2(tgt, src, pip_cvs=cvs)
```

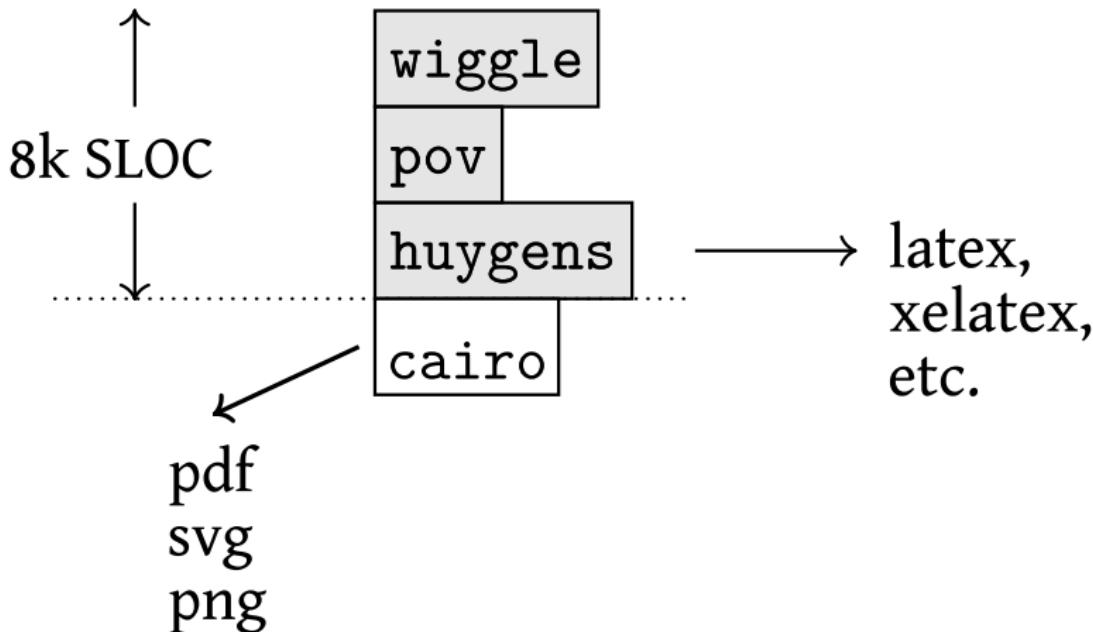

demo of wiggle.py

...

```
from huygens.namespace import *
p = path.circle(0, 0, 0.2)
cvs = Canvas().scale(0.6)
cvs.fill(p, [white]).stroke(p).
cvs.text(0, 0, r"\eta", st_center)
m @ Cell2(tgt, src, pip_cvs=cvs)
```

Implementation notes

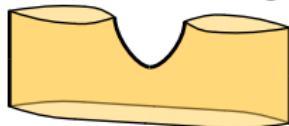

Implementation notes

- reasonable API
 - instance re-use via clones

```
m = Cell0("m", fill=yellow)
```

```
m@m
```

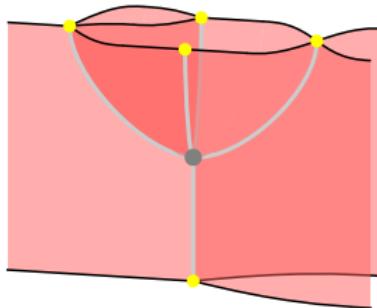

- linear programming + user constraints

- a bazillion parameters; customizable defaults

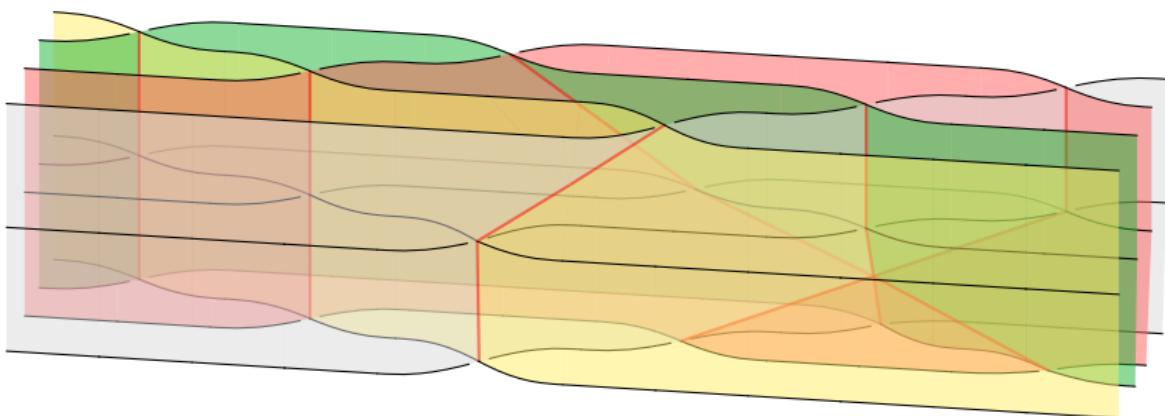

Implementation notes

- vector 3d, not raster 3d
 - alpha blending
 - back to front render order
 - render cones from curvy triangles

Implementation notes

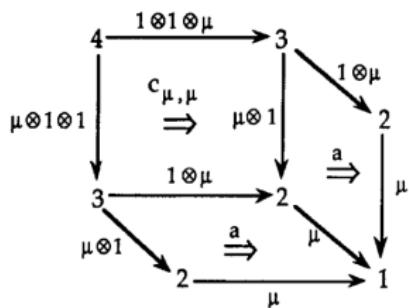

- tree-like data structure
 - lateral, horizontal and vertical composition

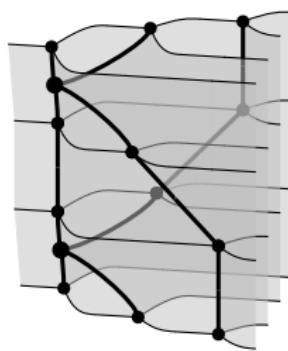

Implementation notes

- API stability
- more documentation
- edge-cases, work-arounds, bugs, ...
 - fixable in principle

The end

How it started

How its going
