# What are Qudits?

Qubits:

$$|\psi\rangle = \alpha |0\rangle + \beta |1\rangle$$

Qudits:

$$|\psi\rangle = a_0 |0\rangle + a_1 |1\rangle + a_2 |2\rangle + \cdots + a_{d-1} |d-1\rangle$$

# Physical Realisation of Qudits

# What is completeness?

A graphical calculus is **complete** if for any two diagrams  $D_1$  and  $D_2$ , we can derive  $D_1 = D_2$  from the rules of the calculus, given that the interpretation of  $D_1$  and  $D_2$  equal.

# Why is completeness important?

- Everything can be shown.
- No 'missing rules'.
- Useful structures.

# Previous completeness results

# The qudit ZXW-calculus

# Standard basis in qudit ZXW

For  $0 \leq j < d$ ,

$$\begin{array}{c} \textcircled{K_j} \\ | \end{array} \xrightarrow{[\cdot]} |d - j\rangle$$

# Generator: Z spider

$[\cdot]$   
 $\mapsto$

$|k\rangle \mapsto |k, k\rangle$

# Generator: X spider

# Generator: W node

$$\begin{array}{c} | \\ \blacktriangle \\ \wedge \end{array} \xrightarrow{[\cdot]} |00\rangle \langle 0| + \sum_{i=1}^{d-1} (|i0\rangle + |0i\rangle) \langle i|$$

That is:

$$\begin{array}{c} \circ \\ | \\ \blacktriangle \\ \wedge \end{array} = \begin{array}{c} \circ \\ | \\ \circ \end{array} \quad \begin{array}{c} \circ \\ | \\ \circ \end{array} \quad \begin{array}{c} \circ \\ | \\ \blacktriangle \\ \wedge \end{array} = \begin{array}{c} \circ \\ | \\ \circ \end{array} \quad \begin{array}{c} \circ \\ | \\ \circ \end{array} + \begin{array}{c} \circ \\ | \\ \circ \end{array} \quad \begin{array}{c} \circ \\ | \\ \circ \end{array}$$

The diagram shows two equations. The first equation shows a W node with a red circle on top and two legs, equal to two separate red circles on legs. The second equation shows a W node with a red circle labeled  $K_j$  on top and two legs, equal to the sum of two terms: a red circle labeled  $K_j$  on a leg and a red circle on a leg, plus a red circle on a leg and a red circle labeled  $K_j$  on a leg.

# Understanding the Z box

Z spider:

$$\begin{array}{c} | \\ \textcircled{\alpha} \\ | \end{array} \xrightarrow{[\cdot]} \begin{bmatrix} 1 & 0 \\ 0 & e^{i\alpha} \end{bmatrix}, \quad \text{where } \alpha \in \mathbb{R}.$$

Z box:

$$\begin{array}{c} | \\ \boxed{a} \\ | \end{array} \xrightarrow{[\cdot]} \begin{bmatrix} 1 & 0 \\ 0 & a \end{bmatrix}, \quad \text{where } a \in \mathbb{C}.$$

# Understanding the qudit Z box

Qubit Z box: for  $a \in \mathbb{C}$ ,

$$\begin{array}{c} | \\ \hline \boxed{a} \\ \hline | \end{array} \xrightarrow{[\cdot]} \begin{bmatrix} 1 & 0 \\ 0 & a \end{bmatrix}$$

Qudit Z box: for  $\vec{a} = (a_1, a_2, \dots, a_{d-1}) \in \mathbb{C}^{d-1}$ ,

$$\begin{array}{c} | \\ \hline \boxed{\vec{a}} \\ \hline | \end{array} \xrightarrow{[\cdot]} \begin{bmatrix} 1 & 0 & 0 & \cdots & 0 \\ 0 & a_1 & 0 & \cdots & 0 \\ 0 & 0 & a_2 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & a_{d-1} \end{bmatrix}$$

# Compact description of the Z box

A quantum circuit diagram showing a single qubit line entering a green rectangular box labeled with a vector  $\vec{a}$ .
$$\begin{array}{c} | \\ \hline \boxed{\vec{a}} \\ \hline | \end{array} \xrightarrow{[\cdot]} \begin{bmatrix} 1 & 0 & 0 & \cdots & 0 \\ 0 & a_1 & 0 & \cdots & 0 \\ 0 & 0 & a_2 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & a_{d-1} \end{bmatrix} = \sum_{j=0}^{d-1} a_j |j\rangle \langle j|,$$

where  $\vec{a} = (a_1, a_2, \dots, a_{d-1}) \in \mathbb{C}^{d-1}$  and  $a_0 := 1$ .

# Generator: Z box

$$\sum_{j=0}^{d-1} a_j |j\rangle^{\otimes m} \langle j|^{\otimes n},$$

where  $\vec{a} = (a_1, \dots, a_{d-1}) \in \mathbb{C}$

and  $a_0 := 1$ .

# What did we prove?

## Theorem

*The ZXW-calculus is universally complete for all finite dimensions.*

# Map-state duality

# A Normal Form

# Completeness using a normal form

If  $D_1$  and  $D_2$  are state diagrams such that  $\llbracket D_1 \rrbracket = \llbracket D_2 \rrbracket$ , then:

So:

# Note: Structure of states

Each state diagram has the following structure:

where  $g_1, \dots, g_k$  are generators.

State  $\implies$  normal form I.

$$\begin{array}{|c|} \hline A_1 \\ \hline \dots \\ \hline \end{array} = \begin{array}{|c|} \hline N_1 \\ \hline \dots \\ \hline \end{array}$$

State  $\implies$  normal form II.

State  $\implies$  normal form III.

State  $\implies$  normal form IV.

State  $\implies$  normal form V.

# State $\Rightarrow$ normal form VI.

# Summary: state $\implies$ normal form

We need to rewrite the following into their normal form:

- Generators
- Tensor product of two normal forms
- Partial-traced normal form

# ZXW-calculus is more than just the sum of its parts

1. Rules of ZX
2. Rules of ZW
3. Rules of ZXW

# The ZX-part of the rules I

(S1)

(S2) (Ept)

(D1) (B2)

where  $\vec{a} = (a_{d-1}, \dots, a_1)$ ,  $\vec{ab} = (a_1 b_1, \dots, a_{d-1} b_{d-1})$ .

# The ZX-part of the rules II

(K0)

(Zer)

(K1)

# The ZXW-part of the rules I

where  $T_j = \underbrace{(0, \dots, 1, \dots, 0)}_{d-j}^{d-1}$ ,  $e_1, \dots, e_n \in \{1, \dots, d-1\}$ .

# The trialgebra rule

# The ZXW-part of the rules II

where  $\overrightarrow{a_{d-1}} = (a_{d-1}, a_{d-1}, \dots, a_{d-1})$ .

# Outlook

- Speedy evaluation of ZXW-diagrams
- Prove completeness of qfinite ZXW-calculus
- More applications for photonics using ZXW
- Analyse the circuit extraction of ZXW-diagrams

# Appendix

## 3 Notations

# Useful notation: The multiplier

$m$  can be labeled modulo  $d$  due to the Hopf law.

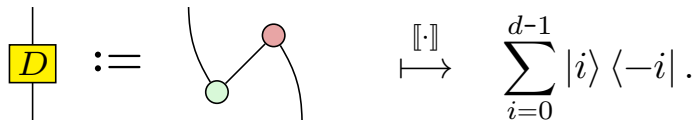

# Example: The multiplier

# Notation: The Hadamard inverse

# Notation: The dualiser

The diagram shows a yellow square labeled  $D$  with a vertical line passing through it. This is equated to a diagram with two curved lines meeting at a central point. The lower-left end of the left curve is a green circle, and the upper-right end of the right curve is a red circle. A double-line arrow points from this diagram to the mathematical expression  $\sum_{i=0}^{d-1} |i\rangle \langle -i|$ .

$$\boxed{D} \quad ::= \quad \text{Diagram} \quad \xrightarrow{[\cdot]} \quad \sum_{i=0}^{d-1} |i\rangle \langle -i|.$$

# Notation: The $V$ and $M$ boxes
