7.4 Homotopy of Maps

```

theory Homotopy
  imports Path_Connected Product_Topology Uncountable_Sets
begin

```

definition *homotopic_with*

where

```

homotopic_with P X Y f g  $\equiv$ 
  ( $\exists h$ . continuous_map (prod_topology (top_of_set {0..1::real}) X) Y h  $\wedge$ 
    ( $\forall x$ .  $h(0, x) = f x$ )  $\wedge$ 
    ( $\forall x$ .  $h(1, x) = g x$ )  $\wedge$ 
    ( $\forall t \in \{0..1\}$ .  $P(\lambda x$ .  $h(t, x))$ )))

```

p, q are functions $X \rightarrow Y$, and the property P restricts all intermediate maps. We often just want to require that P fixes some subset, but to include the case of a loop homotopy, it is convenient to have a general property P .

7.4.26 Contractible spaces

The definition (which agrees with "contractible" on subsets of Euclidean space) is a little cryptic because we don't in fact assume that the constant "a" is in the space. This forces the convention that the empty space / set is contractible, avoiding some special cases.

definition *contractible_space* **where**

contractible_space $X \equiv \exists a. \text{homotopic_with } (\lambda x. \text{True}) \ X \ X \ \text{id } (\lambda x. a)$

lemma *contractible_space_top_of_set* [simp]: *contractible_space* (top_of_set S)

7.4.30 Nullhomotopic mappings

A mapping out of a sphere is nullhomotopic iff it extends to the ball. This even works out in the degenerate cases when the radius is ≤ 0 , and we also don't need to explicitly assume continuity since it's already implicit in both sides of the equivalence.

```

lemma nullhomotopic_from_lemma:
  assumes contg: continuous_on (cball a r - {a}) g
  and fa: ∧e. 0 < e
    ⇒ ∃ d. 0 < d ∧ (∀ x. x ≠ a ∧ norm(x - a) < d ⇒ norm(g x - f

7.8 Infinite sums

In this theory, we introduce the definition of infinite sums, i.e., sums ranging over an infinite, potentially uncountable index set with no particular ordering. (This is different from series. Those are sums indexed by natural numbers, and the order of the index set matters.)

Our definition is quite standard: $s := \sum_{x \in A} f(x)$ is the limit of finite sums $s_F := \sum_{x \in F} f(x)$ for increasing F . That is, s is the limit of the net s_F where F are finite subsets of A ordered by inclusion. We believe that this is the standard definition for such sums. See, e.g., Definition 4.11 in [2]. This definition is quite general: it is well-defined whenever f takes values in some commutative monoid endowed with a Hausdorff topology. (Examples are reals, complex numbers, normed vector spaces, and more.)

The converse of *abs_summable_summable* does not hold: Consider the Hilbert space of square-summable sequences. Let e_i denote the sequence with 1 in the i th position and 0 elsewhere. Let $f(i) := e_i/i$ for $i \geq 1$. We have $\neg f \text{ abs_summable_on } UNIV$ because $\|f(i)\| = 1/i$ and thus the sum over $\|f(i)\|$ diverges. On the other hand, we have $f \text{ summable_on } UNIV$; the limit is the sequence with $1/i$ in the i th position.

(We have not formalized this separating example here because to the best of our knowledge, this Hilbert space has not been formalized in Isabelle/HOL yet.)

The following lemma indeed needs a complete space (as formalized by the premise *complete UNIV*). The following two counterexamples show this:

- Consider the real vector space V of sequences with finite support, and with the ℓ_2 -norm (sum of squares). Let e_i denote the sequence with a 1 at position i . Let $f : \mathbb{Z} \rightarrow V$ be defined as $f(n) := e_{|n|}/n$ (with $f(0) := 0$). We have that $\sum_{n \in \mathbb{Z}} f(n) = 0$ (it even converges absolutely). But $\sum_{n \in \mathbb{N}} f(n)$ does not exist (it would converge against a sequence with infinite support).
- Let f be a positive rational valued function such that $\sum_{x \in B} f(x)$ is $\sqrt{2}$ and $\sum_{x \in A} f(x)$ is 1 (over the reals, with $A \subseteq B$). Then $\sum_{x \in B} f(x)$ does not exist over the rationals. But $\sum_{x \in A} f(x)$ exists.

The lemma also requires uniform continuity of the addition. And example of a topological group with continuous but not uniformly continuous addition would be the positive reals with the usual multiplication as the addition. We do not know whether the lemma would also hold for such topological groups.

The lemmas *infsum_comm_additive_general* and *infsum_comm_additive* (and variants) below both state that the infinite sum commutes with a continuous additive function. *infsum_comm_additive_general* is stated more for more general type classes at the expense of a somewhat less compact formulation of the premises. E.g., by avoiding the constant *additive* which introduces an additional sort constraint (group instead of monoid). For example, extended reals (*ereal*, *ennreal*) are not covered by *infsum_comm_additive*.

```

7.8.7 Infinite sums of formal power series

Consequently, a family $(f_x)_{x \in A}$ of formal power series sums to a series s iff for any $n \geq 0$, the set $A_n = \{x \in A \mid [X^n] f_x \neq 0\}$ is finite and $[X^n] s = \sum_{x \in A_n} [X^n] f_x$.

The first condition can be rephrased as follows: for any $n \geq 0$, for all but finitely many x , the series f_x has subdegree $> n$.

lemma *has_sum_fpsI*:

assumes $\bigwedge n. \text{finite } \{x \in A. \text{fps_nth } (F \ x) \ n \neq 0\}$

assumes $\bigwedge n. \text{fps_nth } S \ n = (\sum x \mid x \in A \wedge \text{fps_nth } (F \ x) \ n \neq 0. \text{fps_nth } (F \ x) \ n)$

shows $(F \text{ has_sum } S) \ A$

unfolding *has_sum_def*

proof (*rule tendsto_fpsI*)

fix $n :: \text{nat}$

define B **where** $B = \{x \in A. \text{fps_nth } (F \ x) \ n \neq 0\}$

from *assms(1)* **have** [*intro*]: *finite B*

unfolding *B_def* **by** *auto*

moreover **have** $B \subseteq A$

by (*auto simp: B_def*)

ultimately **have** *eventually* $(\lambda X. \text{finite } X \wedge B \subseteq X \wedge X \subseteq A) \ (\text{finite_subsets_at_top } A)$

by (*subst eventually_finite_subsets_at_top*) *blast*

thus *eventually* $(\lambda X. \text{fps_nth } (\sum x \in X. F \ x) \ n = \text{fps_nth } S \ n) \ (\text{finite_subsets_at_top } A)$

proof *eventually_elim*

case (*elim X*)

have $\text{fps_nth } (\sum x \in X. F \ x) \ n = (\sum x \in X. \text{fps_nth } (F \ x) \ n)$

by (*simp add: fps_sum_nth*)

also **have** $\dots = (\sum x \in B. \text{fps_nth } (F \ x) \ n)$

by (*rule sum.mono_neutral_right*) (*use* $\langle \text{finite } B \rangle \ \langle B \subseteq A \rangle$ *elim in* $\langle \text{auto simp: B_def} \rangle$)

7.11.20 Theorems from Kuratowski

Kuratowski, Remark on an Invariance Theorem, *Fundamenta Mathematicae* **37** (1950), pp. 251-252. The idea is that in suitable spaces, to show "number of components of the complement" (without distinguishing orders of infinity) is a homeomorphic invariant, it suffices to show it for closed subsets. Kuratowski states the main result for a "locally connected continuum", and seems clearly to be implicitly assuming that means metrizable. We call out the general topological hypotheses more explicitly, which do not however include connectedness.

7.11.23 Co-sparseness filter

The co-sparseness filter allows us to talk about properties that hold on a given set except for an “insignificant” number of points that are sparse in that set.

```

Continuity of addition

The next few lemmas remove an unnecessary assumption in *tendsto_add_ereal*, culminating in *tendsto_add_ereal_general* which essentially says that the addition is continuous on *ereal* times *ereal*, except at $(-\infty, \infty)$ and $(\infty, -\infty)$. It is much more convenient in many situations, see for instance the proof of *tendsto_sum_ereal* below.

```

lemma tendsto_add_ereal_PInf:
  fixes  $y :: \text{ereal}$ 
  assumes  $y: y \neq -\infty$ 
  assumes  $f: (f \longrightarrow \infty) \ F$  and  $g: (g \longrightarrow y) \ F$ 
  shows  $((\lambda x. f\ x + g\ x) \longrightarrow \infty) \ F$ 
proof -
  have  $\exists C. \text{eventually } (\lambda x. g\ x > \text{ereal } C) \ F$ 
  proof (cases  $y$ )
    case (real  $r$ )
      have  $y > y - 1$  using  $y$  real by (simp add: ereal_between(1))
      then have  $\text{eventually } (\lambda x. g\ x > y - 1) \ F$  using  $g$   $y$  order_tendsto_iff by

7.14.2 Radius of convergence

The radius of convergence of a power series. This value always exists, ranges from 0 to ∞ , and the power series is guaranteed to converge for all inputs with a norm that is smaller than that radius and to diverge for all inputs with a norm that is greater.

definition *conv_radius* :: $(\text{nat} \Rightarrow 'a :: \text{banach}) \Rightarrow \text{ereal}$ **where**
conv_radius $f = \text{inverse} (\text{limsup} (\lambda n. \text{ereal} (\text{root } n (\text{norm } (f \ n))))))$
