No formalisation of Liouville's Approximation Theorem because this is already in the AFP as Liouville_Numbers. Apostol's Theorem 7.5 should be exactly the theorem liouville_irrational_algebraic. There is a minor discrepancy in the definition of "Liouville number" between Apostol and Eberl: he requires the denominator to be positive, while Eberl require it to exceed 1.

10.5 Scheffé's lemma

The next lemma shows that L^1 convergence of a sequence of functions follows from almost everywhere convergence and the weaker condition of the convergence of the integrated norms (or even just the nontrivial inequality about them). Useful in a lot of contexts! This statement (or its variations) are known as Scheffe lemma.

The formalization is more painful as one should jump back and forth between reals and ereals and justify all the time positivity or integrability (thankfully, measurability is handled more or less automatically).

```

proposition Scheffe_lemma1:
  assumes  $\bigwedge n. \text{integrable } M (F n) \text{ integrable } M f$ 
     $\text{AE } x \text{ in } M. (\lambda n. F n x) \longrightarrow f x$

10.7.4 Averaging Theorem

We aim to lift results from the real case to arbitrary Banach spaces. Our fundamental tool in this regard will be the averaging theorem. The proof of this theorem is due to Serge Lang (Real and Functional Analysis) [5]. The theorem allows us to make statements about a function's value almost everywhere, depending on the value its integral takes on various sets of the measure space.

Before we introduce and prove the averaging theorem, we will first show the following lemma which is crucial for our proof. While not stated exactly in this manner, our proof makes use of the characterization of second-countable topological spaces given in the book General Topology by Ryszard Engelking (Theorem 4.1.15) [4]. (Engelking's book *General Topology*)

lemma balls_countable_basis:

obtains $D :: 'a :: \{\text{metric_space}, \text{second_countable_topology}\}$ set
where topological_basis (case_prod ball ' $(D \times (\mathbb{Q} \cap \{0 < ..\}))$)
and countable D
and $D \neq \{\}$

10.10.1 The Euler form and the logarithmic Gamma function

We define the Gamma function by first defining its multiplicative inverse $rGamma$. This is more convenient because $rGamma$ is entire, which makes proofs of its properties more convenient because one does not have to watch out for discontinuities. (e.g. $rGamma$ fulfils $rGamma\ z = z * rGamma\ (z + 1)$ everywhere, whereas the Γ function does not fulfil the analogous equation on the non-positive integers)

We define the Γ function (resp. its reciprocal) in the Euler form. This form has the advantage that it is a relatively simple limit that converges everywhere. The limit at the poles is 0 (due to division by 0). The functional equation $Gamma\ (z + 1) = z * Gamma\ z$ follows immediately from the definition.

definition $Gamma_series :: ('a :: \{banach, real_normed_field\}) \Rightarrow nat \Rightarrow 'a$ **where**
 $Gamma_series\ z\ n = fact\ n * exp\ (z * of_real\ (ln\ (of_nat\ n))) / pochhammer\ z\ (n+1)$

definition $Gamma_series' :: ('a :: \{banach, real_normed_field\}) \Rightarrow nat \Rightarrow 'a$ **where**
 $Gamma_series'\ z\ n = fact\ (n - 1) * exp\ (z * of_real\ (ln\ (of_nat\ n))) / pochhammer\ z\ n$

definition $rGamma_series :: ('a :: \{banach, real_normed_field\}) \Rightarrow nat \Rightarrow 'a$ **where**
 $rGamma_series\ z\ n = pochhammer\ z\ (n+1) / (fact\ n * exp\ (z * of_real\ (ln\ (of_nat\ n))))$

    → 1 by simp
  qed

```

We now show that the series that defines the Γ function in the Euler form converges and that the function defined by it is continuous on the complex halfspace with positive real part.

We do this by showing that the logarithm of the Euler series is continuous and converges locally uniformly, which means that the log-Gamma function defined by its limit is also continuous.

This will later allow us to lift holomorphicity and continuity from the log-Gamma function to the inverse of the Gamma function, and from that to the Gamma function itself.

definition $\text{ln_Gamma_series} :: ('a :: \{\text{banach}, \text{real_normed_field}, \text{ln}\}) \Rightarrow \text{nat} \Rightarrow 'a$ **where**
 $\text{ln_Gamma_series } z \ n = z * \text{ln } (\text{of_nat } n) - \text{ln } z - (\sum k=1..n. \text{ln } (z / \text{of_nat } k + 1))$

definition $\text{ln_Gamma_series}' :: ('a :: \{\text{banach}, \text{real_normed_field}, \text{ln}\}) \Rightarrow \text{nat} \Rightarrow 'a$ **where**
 $\text{ln_Gamma_series}' z \ n =$
 $- \text{euler_mascheroni} * z - \text{ln } z + (\sum k=1..n. z / \text{of_nat } n - \text{ln } (z / \text{of_nat } k + 1))$

definition $\text{ln_Gamma} :: ('a :: \{\text{banach}, \text{real_normed_field}, \text{ln}\}) \Rightarrow 'a$ **where**
 $\text{ln_Gamma } z = \text{lim } (\text{ln_Gamma_series } z)$

We now show that the log-Gamma series converges locally uniformly for all complex numbers except the non-positive integers. We do this by proving that the series is locally Cauchy.

10.10.7 The uniqueness of the real Gamma function

The following is a proof of the Bohr–Mollerup theorem, which states that any log-convex function G on the positive reals that fulfils $G(1) = 1$ and satisfies the functional equation $G(x + 1) = x G(x)$ must be equal to the Gamma function. In principle, if G is a holomorphic complex function, one could then extend this from the positive reals to the entire complex plane (minus the non-positive integers, where the Gamma function is not defined).

```

The following lemma is somewhat annoying. With a little bit of complex analysis (Cauchy's integral theorem, to be exact), this would be completely trivial. However, we want to avoid depending on the complex analysis session at this point, so we prove it the hard way.

private lemma *Gamma_reflection_aux*:

```

  defines h  $\equiv$   $\lambda z::\text{complex. if } z \in \mathbb{Z} \text{ then } 0 \text{ else}$ 
    (of_real pi * cot (of_real pi*z) + Digamma z - Digamma (1 - z))
  defines a  $\equiv$  complex_of_real pi
  obtains h' where continuous_on UNIV h'  $\wedge$  z. (h has_field_derivative (h' z))
(at z)
proof -
  define f where f n = a * of_real (cos_coeff (n+1) - sin_coeff (n+2)) for n
  define F where F z = (if z = 0 then 0 else (cos (a*z) - sin (a*z)/(a*z)) / z)
for z
  define g where g n = complex_of_real (sin_coeff (n+1)) for n
  define G where G z = (if z = 0 then 1 else sin (a*z)/(a*z)) for z
  have a_nz: a  $\neq$  0 unfolding a_def by simp

10.13 Integral Test for Summability

theory *Integral_Test*

imports *Henstock_Kurzweil_Integration*

begin

The integral test for summability. We show here that for a decreasing non-negative function, the infinite sum over that function evaluated at the natural numbers converges iff the corresponding integral converges.

As a useful side result, we also provide some results on the difference between the integral and the partial sum. (This is useful e.g. for the definition of the Euler-Mascheroni constant)

An existence theorem for "improper" integrals. Hake's theorem implies that if the integrals over subintervals have a limit, the integral exists. We only need to assume that the integrals are bounded, and we get absolute integrability, but we also need a (rather weak) bound assumption on the function.

```

10.17 Embedding Measure Spaces with a Function

```

theory Embed_Measure
imports Binary_Product_Measure
begin

```

Given a measure space on some carrier set Ω and a function f , we can define a push-forward measure on the carrier set $f(\Omega)$ whose σ -algebra is the one generated by mapping f over the original sigma algebra.

This is useful e.g. when f is injective, i.e. it is some kind of “tagging” function. For instance, suppose we have some algebraic datatype of values with various constructors, including a constructor *RealVal* for real numbers. Then *embed_measure* allows us to lift a measure on real numbers to the appropriate subset of that algebraic datatype.

```

definition embed_measure :: 'a measure  $\Rightarrow$  ('a  $\Rightarrow$  'b)  $\Rightarrow$  'b measure where

10.22.11 Convergence criteria: especially uniform convergence of infinite products

Cauchy's criterion for the convergence of infinite products, adapted to proving uniform convergence: let $f_k(x)$ be a sequence of functions such that

1. $f_k(x)$ has uniformly bounded partial products, i.e. there exists a constant C such that $\prod_{k=0}^m f_k(x) \leq C$ for all m and $x \in A$.
2. For any $\varepsilon > 0$ there exists a number $M \in \mathbb{N}$ such that, for any $m, n \geq M$ and all $x \in A$ we have $|\left(\prod_{k=m}^n f_k(x)\right) - 1| < \varepsilon$

Then $\prod_{k=0}^n f_k(x)$ converges to $\prod_{k=0}^{\infty} f_k(x)$ uniformly for all $x \in A$.

lemma uniformly_convergent_prod_Cauchy:

fixes $f :: \text{nat} \Rightarrow 'a :: \text{topological_space} \Rightarrow 'b :: \{\text{real_normed_div_algebra}, \text{comm_ring_1}, \text{banach}\}$

assumes $C: \bigwedge x\ m. x \in A \implies \text{norm } \left(\prod_{k < m} f\ k\ x\right) \leq C$

assumes $\bigwedge e. e > 0 \implies \exists M. \forall x \in A. \forall m \geq M. \forall n \geq m. \text{dist } \left(\prod_{k=m..n} f\ k\ x\right) 1 < e$

shows uniformly_convergent_on A ($\lambda N\ x. \prod_{n < N} f\ n\ x$)

The following theorem relates (*abs_summable_on*) with *Infinite_Sum.abs_summable_on*. Note that while this theorem expresses an equivalence, the notion on the lhs is more general nonetheless because it applies to a wider range of types. (The rhs requires second-countable Banach spaces while the lhs is well-defined on arbitrary real vector spaces.)

lemma *abs_summable_equivalent*: $\langle \text{Infinite_Sum.abs_summable_on } f \ A \longleftrightarrow f \text{ abs_summable_on } A \rangle$

proof (rule iffI)

define *n* **where** $\langle n \ x = \text{norm } (f \ x) \rangle$ **for** *x*

assume $\langle n \text{ summable_on } A \rangle$

then have $\langle \text{sum } n \ F \leq \text{infsum } n \ A \rangle$ **if** $\langle \text{finite } F \rangle$ **and** $\langle F \subseteq A \rangle$ **for** *F*

using *that* **by** (auto simp flip: infsum_finite simp: n_def[abs_def] intro!: infsum_mono_neutral)

then show $\langle f \text{ abs_summable_on } A \rangle$

by (auto intro!: abs_summable_finite_sumsI simp: n_def)

next

define *n* **where** $\langle n \ x = \text{norm } (f \ x) \rangle$ **for** *x*

assume $\langle f \text{ abs_summable_on } A \rangle$

then have $\langle n \text{ abs_summable_on } A \rangle$

by (simp add: $\langle f \text{ abs_summable_on } A \rangle$ n_def)

then have $\langle \text{sum } n \ F \leq \text{infsetsum } n \ A \rangle$ **if** $\langle \text{finite } F \rangle$ **and** $\langle F \subseteq A \rangle$ **for** *F*

10.26 Absolute Retracts, Absolute Neighbourhood Retracts and Euclidean Neighbourhood Retracts

```

theory Retracts
imports
  Brouwer_Fixpoint
  Continuous_Extension
begin

```

Absolute retracts (AR), absolute neighbourhood retracts (ANR) and also Euclidean neighbourhood retracts (ENR). We define AR and ANR by specializing the standard definitions for a set to embedding in spaces of higher dimension.

John Harrison writes: "This turns out to be sufficient (since any set in \mathbb{R}^n can be embedded as a closed subset of a convex subset of \mathbb{R}^{n+1}) to derive the usual definitions, but we need to split them into two implications because of the lack of type quantifiers. Then ENR turns out to be equivalent to ANR plus local compactness."

```

definition AR :: ' $a::\text{topological\_space set} \Rightarrow \text{bool}$  where
  AR  $S \equiv \forall U. \forall S'::('a * \text{real}) \text{ set.}$ 
     $S \text{ homeomorphic } S' \wedge \text{closedin } (\text{top\_of\_set } U) S' \longrightarrow S' \text{ retract\_of } U$ 

```

```

definition ANR :: ' $a::\text{topological\_space set} \Rightarrow \text{bool}$  where
  ANR  $S \equiv \forall U. \forall S'::('a * \text{real}) \text{ set.}$ 
     $S \text{ homeomorphic } S' \wedge \text{closedin } (\text{top\_of\_set } U) S' \longrightarrow (\exists T. \text{openin } (\text{top\_of\_set } U) T \wedge S' \text{ retract\_of } T)$

10.26.8 The complement of a set and path-connectedness

Complement in dimension $N > 1$ of set homeomorphic to any interval in any dimension is (path-)connected. This naively generalizes the argument in Ryuji Maehara's paper "The Jordan curve theorem via the Brouwer fixed point theorem", American Mathematical Monthly 1984.

10.27.1 A map from a sphere to a higher dimensional sphere is nullhomotopic

lemma spheremap_lemma1:

fixes $f :: 'a::euclidean_space \Rightarrow 'a::euclidean_space$

assumes $subspace\ S\ subspace\ T$ **and** $dimST: dim\ S < dim\ T$

and $S \subseteq T$

and $diff_f: f\ differentiable_on\ sphere\ 0\ 1 \cap S$

shows $f\ ' (sphere\ 0\ 1 \cap S) \neq sphere\ 0\ 1 \cap T$

proof

assume $fin: f\ ' (sphere\ 0\ 1 \cap S) = sphere\ 0\ 1 \cap T$

have $inS: \bigwedge x. \llbracket x \in S; x \neq 0 \rrbracket \implies (x /_R norm\ x) \in S$

using $subspace_mul\ \langle subspace\ S \rangle$ **by** blast

have $subS01: (\lambda x. x /_R norm\ x) \ ' (S - \{0\}) \subseteq sphere\ 0\ 1 \cap S$

using $\langle subspace\ S \rangle\ subspace_mul$ **by** fastforce

then have $diff_f': f\ differentiable_on\ (\lambda x. x /_R norm\ x) \ ' (S - \{0\})$

by (rule differentiable_on_subset [OF diff_f])

define g **where** $g \equiv \lambda x. norm\ x *_R f(inverse(norm\ x) *_R x)$

have $gdiff: g\ differentiable_on\ S - \{0\}$

unfolding g_def

by (rule diff_f' derivative_intros differentiable_on_compose [where f=f] |
force)+

have $geq: g\ ' (S - \{0\}) = T - \{0\}$

proof

have $\bigwedge u. \llbracket u \in S; norm\ u *_R f(u /_R norm\ u) \notin T \rrbracket \implies u = 0$

by (metis (mono_tags, lifting) DiffI subS01 subspace_mul [OF $\langle subspace\ T \rangle$])

$fin\ image_subset\ iff\ inf_le2\ singletonD$

then have $g \in (S - \{0\}) \rightarrow T$

using g_def **by** blast

moreover have $g \in (S - \{0\}) \rightarrow UNIV - \{0\}$

proof (clarsimp simp: g_def)

fix y

assume $y \in S$ **and** $f0: f(y /_R norm\ y) = 0$

then have $y \neq 0 \implies y /_R norm\ y \in sphere\ 0\ 1 \cap S$

by (auto simp: subspace_mul [OF $\langle subspace\ S \rangle$])

then show $y = 0$

by (metis fin f0 Int_iff image_iff mem_sphere_0 norm_eq_zero zero_neq_one)

qed

ultimately show $g\ ' (S - \{0\}) \subseteq T - \{0\}$

10.32.5 Change-of-variables theorem

The classic change-of-variables theorem. We have two versions with quite general hypotheses, the first that the transforming function has a continuous inverse, the second that the base set is Lebesgue measurable.

10.33.1 Local Lipschitz continuity

Given a function defined on a real interval, it is Lipschitz-continuous if and only if it is locally so, as proved in the following lemmas. It is useful especially for piecewise-defined functions: if each piece is Lipschitz, then so is the whole function. The same goes for functions defined on geodesic spaces, or more generally on geodesic subsets in a metric space (for instance convex subsets in a real vector space), and this follows readily from the real case, but we will not prove it explicitly.

We give several variations around this statement. This is essentially a connectedness argument.

```

```

We deduce that if a function is Lipschitz on finitely many closed sets on the real line, then it is Lipschitz on any interval contained in their union. The difficulty in the proof is to show that any point z in this interval (except the maximum) has a point arbitrarily close to it on its right which is contained in a common initial closed set. Otherwise, we show that there is a small interval (z, T) which does not intersect any of the initial closed sets, a contradiction.

```

```

begin

In this theory, we will connect formal power series (which are algebraic objects) with analytic functions. This will become more important in complex analysis, and indeed some of the less trivial results will only be proven there.

10.35.1 Balls with extended real radius

The following is a variant of *ball* that also allows an infinite radius.

definition *eball* :: 'a :: metric_space \Rightarrow ereal \Rightarrow 'a set **where**
eball z r = {z'. ereal (dist z z') < r}

lemma *in_eball_iff* [simp]: $z \in \text{eball } z0 \ r \longleftrightarrow \text{ereal } (\text{dist } z0 \ z) < r$
by (simp add: *eball_def*)

lemma *eball_ereal* [simp]: $\text{eball } z \ (\text{ereal } r) = \text{ball } z \ r$

10.35.6 Power series expansions of analytic functions

This predicate contains the notion that the given formal power series converges in some disc of positive radius around the origin and is equal to the given complex function there.

This relationship is unique in the sense that no complex function can have more than one formal power series to which it expands, and if two holomorphic functions that are holomorphic on a connected open set around the origin and have the same power series expansion, they must be equal on that set.

More concrete statements about the radius of convergence can usually be made, but for many purposes, the statment that the series converges to the function in some neighbourhood of the origin is enough, and that can be shown almost fully automatically in most cases, as there are straightforward introduction rules to show this.

In particular, when one wants to relate the coefficients of the power series to the values of the derivatives of the function at the origin, or if one wants to approximate the coefficients of the series with the singularities of the function, this predicate is enough.

10.37 Metrics on product spaces

```

theory Function_Metric
  imports
    Function_Topology
    Elementary_Metric_Spaces
begin

```

In general, the product topology is not metrizable, unless the index set is countable. When the index set is countable, essentially any (convergent)

combination of the metrics on the factors will do. We use below the simplest one, based on L^1 , but L^2 would also work, for instance.

What is not completely trivial is that the distance thus defined induces the same topology as the product topology. This is what we have to prove to show that we have an instance of *metric_space*.

The proofs below would work verbatim for general countable products of metric spaces. However, since distances are only implemented in terms of type classes, we only develop the theory for countable products of the same space.

instantiation *fun* :: (countable, metric_space) metric_space
begin

definition *dist_fun_def*:

$$\text{dist } x \ y = (\sum n. (1/2)^n * \min (\text{dist } (x \text{ (from_nat } n)) (y \text{ (from_nat } n))) \ 1)$$

definition *uniformity_fun_def*:

$$(\text{uniformity}::('a \Rightarrow 'b) \times ('a \Rightarrow 'b)) \text{ filter} = (\text{INF } e \in \{0 < ..\}. \text{principal } \{(x, y). \text{dist } (x::('a \Rightarrow 'b)) \ y < e\})$$

Except for the first one, the auxiliary lemmas below are only useful when proving the instance: once it is proved, they become trivial consequences of the general theory of metric spaces. It would thus be desirable to hide them once the instance is proved, but I do not know how to do this.

lemma *dist_fun_le_dist_first_terms*:

$$\text{dist } x \ y \leq 2 * \text{Max } \{\text{dist } (x \text{ (from_nat } n)) (y \text{ (from_nat } n)) \mid n. n \leq N\} + (1/2)^N$$

proof –

Finally, we show that the topology generated by the distance and the product topology coincide. This is essentially contained in Lemma *fun_open_ball_aux*, except that the condition to prove is expressed with filters. To deal with this, we copy some mumbo jumbo from Lemma *eventually_uniformity_metric* in `~/src/HOL/Real_Vector_Spaces.thy`

```

fix U::('a  $\Rightarrow$  'b) set
have eventually P uniformity  $\longleftrightarrow$  ( $\exists e>0. \forall x (y::('a \Rightarrow 'b)). \text{dist } x y < e \longrightarrow$ 
P (x, y)) for P
unfolding uniformity_fun_def apply (subst eventually_INF_base)
by (auto simp: eventually_principal subset_eq intro: bexI[of _ min _ _])
then show open U = ( $\forall x \in U. \forall_F (x', y) \text{ in uniformity. } x' = x \longrightarrow y \in U$ )
unfolding fun_open_ball_aux by simp
qed (simp add: uniformity_fun_def)

```

end

Nice properties of spaces are preserved under countable products. In addition to first countability, second countability and metrizable, as we have seen above, completeness is also preserved, and therefore being Polish.
