7.16.7 The strong operator topology on continuous linear operators

Let $'a$ and $'b$ be two normed real vector spaces. Then the space of linear continuous operators from $'a$ to $'b$ has a canonical norm, and therefore a canonical corresponding topology (the type classes instantiation are given in `Bounded_Linear_Function.thy`).

However, there is another topology on this space, the strong operator topology, where T_n tends to T iff, for all x in $'a$, then $T_n x$ tends to $T x$. This is precisely the product topology where the target space is endowed with the norm topology. It is especially useful when $'b$ is the set of real numbers, since then this topology is compact.

We can not implement it using type classes as there is already a topology, but at least we can define it as a topology.

Note that there is yet another (common and useful) topology on operator spaces, the weak operator topology, defined analogously using the product topology, but where the target space is given the weak-* topology, i.e., the pullback of the weak topology on the bidual of the space under the canonical embedding of a space into its bidual. We do not define it there, although it could also be defined analogously.

7.17.8 Uniqueness of derivative

The general result is a bit messy because we need approachability of the limit point from any direction. But OK for nontrivial intervals etc.

proposition frechet_derivative_unique_within:

fixes $f :: 'a::euclidean_space \Rightarrow 'b::real_normed_vector$
 assumes 1: $(f \text{ has_derivative } f') \text{ (at } x \text{ within } S)$
 and 2: $(f \text{ has_derivative } f'') \text{ (at } x \text{ within } S)$
 and $S: \bigwedge i \in e. \llbracket i \in \text{Basis}; e > 0 \rrbracket \implies \exists d. 0 < |d| \wedge |d| < e \wedge (x + d *_{\mathbb{R}} i) \in S$
 shows $f' = f''$

proof –

note $as = \text{assms}(1,2)[\text{unfolded has_derivative_def}]$
then interpret f' : *bounded_linear* f' **by** *auto*
from as **interpret** f'' : *bounded_linear* f'' **by** *auto*
have $x \text{ islimpt } S$ **unfolding** *islimpt_approachable*

7.17.23 The concept of continuously differentiable

John Harrison writes as follows:

“The usual assumption in complex analysis texts is that a path γ should be piecewise continuously differentiable, which ensures that the path integral exists at least for any continuous f , since all piecewise continuous functions are integrable. However, our notion of validity is weaker, just piecewise differentiability... [namely] continuity plus differentiability except on a finite set... [Our] underlying theory of integration is the Kurzweil-Henstock theory. In contrast to the Riemann or Lebesgue theory (but in common with a simple notion based on antiderivatives), this can integrate all derivatives.”

"Formalizing basic complex analysis." From Insight to Proof: Festschrift in Honour of Andrzej Trybulec. Studies in Logic, Grammar and Rhetoric 10.23 (2007): 151-165.

And indeed he does not assume that his derivatives are continuous, but

the penalty is unreasonably difficult proofs concerning winding numbers. We need a self-contained and straightforward theorem asserting that all derivatives can be integrated before we can adopt Harrison's choice.

This function returns the angle of a complex number from its representation in polar coordinates. Due to periodicity, its range is arbitrary. Arg2pi follows HOL Light in adopting the interval $[0, 2\pi)$. But we have the same periodicity issue with logarithms, and it is usual to adopt the same interval for the complex logarithm and argument functions. Further on down, we shall define both functions for the interval $(-\pi, \pi]$. The present version is provided for compatibility.

7.20.34 Convexity of circular sectors in the complex plane

In this section we will show that if we have two non-zero points w and z in the complex plane whose arguments differ by less than π , then the argument of any point on the line connecting w and z lies between the arguments of w and z . Moreover, the norm of any such point is no greater than the norms of w and z .

Geometrically, this means that if we have a sector around the origin with a central angle less than π (minus the origin itself) then that region is convex.

lemma Arg_closed_segment_aux1:

7.20.35 Complex cones

We introduce the following notation to describe the set of all complex numbers of the form ce^{ix} where $c \geq 0$ and $x \in [a, b]$.

definition $\text{complex_cone} :: \text{real} \Rightarrow \text{real} \Rightarrow \text{complex set}$ **where**
 $\text{complex_cone } a\ b = (\lambda(r,a). \text{rcis } r\ a) \text{ ' } (\{0.. \} \times \text{closed_segment } a\ b)$

lemma $\text{in_complex_cone_iff}$: $z \in \text{complex_cone } a\ b \longleftrightarrow (\exists x \in \text{closed_segment } a\ b. z = \text{rcis } (\text{norm } z)\ x)$
 by (auto simp: $\text{complex_cone_def image_iff}$)

lemma $\text{zero_in_complex_cone}$ [simp, intro]: $0 \in \text{complex_cone } a\ b$
 by (auto simp: $\text{in_complex_cone_iff}$)

lemma $\text{in_complex_cone_iff_Arg}$:
 assumes $a \in \{-\pi < .. \pi\}$ $b \in \{-\pi < .. \pi\}$
 shows $z \in \text{complex_cone } a\ b \longleftrightarrow z = 0 \vee \text{Arg } z \in \text{closed_segment } a\ b$
proof
 assume $z \in \text{complex_cone } a\ b$
 then obtain $r\ x$ where $*$: $x \in \text{closed_segment } a\ b$ $z = \text{rcis } r\ x$ $r \geq 0$
 by (auto simp: complex_cone_def)
 have $\text{closed_segment } a\ b \subseteq \{-\pi < .. \pi\}$

8.1 Sigma Algebra

Sigma algebras are an elementary concept in measure theory. To measure — that is to integrate — functions, we first have to measure sets. Unfortunately, when dealing with a large universe, it is often not possible to consistently assign a measure to every subset. Therefore it is necessary to define the set of measurable subsets of the universe. A sigma algebra is such a set that has three very natural and desirable properties.

8.1.1 Families of sets

```
locale subset_class =
  fixes  $\Omega :: 'a\ set$  and  $M :: 'a\ set\ set$ 
  assumes space_closed:  $M \subseteq Pow\ \Omega$

8.7.3 Measurability

There are two natural sigma-algebras on a product space: the borel sigma algebra, generated by open sets in the product, and the product sigma algebra, countably generated by products of measurable sets along finitely many coordinates. The second one is defined and studied in `Finite_Product_Measure.thy`.

These sigma-algebras share a lot of natural properties (measurability of coordinates, for instance), but there is a fundamental difference: open sets are generated by arbitrary unions, not only countable ones, so typically many open sets will not be measurable with respect to the product sigma algebra (while all sets in the product sigma algebra are borel). The two sigma algebras coincide only when everything is countable (i.e., the product is countable, and the borel sigma algebra in the factor is countably generated).

In this paragraph, we develop basic measurability properties for the borel sigma algebra, and compare it with the product sigma algebra as explained above.

```

8.9 Bochner Integration for Vector-Valued Functions

```

theory Bochner_Integration
  imports Finite_Product_Measure
begin

```

In the following development of the Bochner integral we use second countable topologies instead of separable spaces. A second countable topology is also separable.

proposition *borel_measurable_implies_sequence_metric:*

fixes $f :: 'a \Rightarrow 'b :: \{\text{metric_space, second_countable_topology}\}$
assumes $[\text{measurable}]: f \in \text{borel_measurable } M$
shows $\exists F. (\forall i. \text{simple_function } M (F i)) \wedge (\forall x \in \text{space } M. (\lambda i. F i x) \longrightarrow f x) \wedge$
 $(\forall i. \forall x \in \text{space } M. \text{dist } (F i x) z \leq 2 * \text{dist } (f x) z)$

proof –

obtain $D :: 'b \text{ set}$ **where** *countable D and* $D: \bigwedge X. \text{open } X \implies X \neq \{\} \implies$
 $\exists d \in D. d \in X$
by (*erule countable_dense_setE*)

Covering lemma

Some technical lemmas used in the approximation results that follow. Proof of the covering lemma is an obvious multidimensional generalization of Lemma 3, p65 of Swartz's "Introduction to Gauge Integrals".

proposition *covering_lemma*:

assumes $S \subseteq \text{cbox } a\ b \text{ box } a\ b \neq \{\}$ *gauge* g

obtains \mathcal{D} **where**

countable $\mathcal{D} \cup \mathcal{D} \subseteq \text{cbox } a\ b$

$\bigwedge K. K \in \mathcal{D} \implies \text{interior } K \neq \{\} \wedge (\exists c\ d. K = \text{cbox } c\ d)$

pairwise $(\lambda A\ B. \text{interior } A \cap \text{interior } B = \{\})\ \mathcal{D}$

$\bigwedge K. K \in \mathcal{D} \implies \exists x \in S \cap K. K \subseteq g\ x$

$\bigwedge u\ v. \text{cbox } u\ v \in \mathcal{D} \implies \exists n. \forall i \in \text{Basis}. v \cdot i - u \cdot i = (b \cdot i - a \cdot i) / 2^n$
 $S \subseteq \bigcup \mathcal{D}$

proof –

have *aibi*: $\bigwedge i. i \in \text{Basis} \implies a \cdot i \leq b \cdot i$ **and** *normab*: $0 < \text{norm}(b - a)$

using $\langle \text{box } a\ b \neq \{\} \rangle \text{ box_eq_empty box_idem}$ **by** *fastforce*+

let $?K0 = \lambda(n, f::'a \Rightarrow \text{nat}).$

$\text{cbox } (\sum i \in \text{Basis}. (a \cdot i + (f\ i / 2^n) * (b \cdot i - a \cdot i))) *_{\mathbb{R}} i$

$(\sum i \in \text{Basis}. (a \cdot i + ((f\ i + 1) / 2^n) * (b \cdot i - a \cdot i))) *_{\mathbb{R}} i$

let $?D0 = ?K0\ ' (SIGMA\ n:UNIV. Pi_E\ \text{Basis } (\lambda i::'a. \text{lessThan } (2^n)))$

obtain $\mathcal{D}0$ **where** *count*: *countable* $\mathcal{D}0$

and *sub*: $\bigcup \mathcal{D}0 \subseteq \text{cbox } a\ b$

and *int*: $\bigwedge K. K \in \mathcal{D}0 \implies (\text{interior } K \neq \{\}) \wedge (\exists c\ d. K = \text{cbox } c\ d)$

and *intdj*: $\bigwedge A\ B. [A \in \mathcal{D}0; B \in \mathcal{D}0] \implies A \subseteq B \vee B \subseteq A \vee \text{interior } A \cap \text{interior } B = \{\}$

and *SK*: $\bigwedge x. x \in S \implies \exists K \in \mathcal{D}0. x \in K \wedge K \subseteq g\ x$

and *cbox*: $\bigwedge u\ v. \text{cbox } u\ v \in \mathcal{D}0 \implies \exists n. \forall i \in \text{Basis}. v \cdot i - u \cdot i = (b \cdot i - a \cdot i) / 2^n$

and *fin*: $\bigwedge K. K \in \mathcal{D}0 \implies \text{finite } \{L \in \mathcal{D}0. K \subseteq L\}$
