

The Constructible Universe and the Relative Consistency of the Axiom of Choice

Lawrence C Paulson

March 13, 2025

Abstract

Gödel's proof of the relative consistency of the axiom of choice [1] is one of the most important results in the foundations of mathematics. It bears on Hilbert's first problem, namely the continuum hypothesis, and indeed Gödel also proved the relative consistency of the continuum hypothesis. Just as important, Gödel's proof introduced the *inner model* method of proving relative consistency, and it introduced the concept of *constructible set*. Kunen [2] gives an excellent description of this body of work.

This Isabelle/ZF formalization demonstrates Gödel's claim that his proof can be undertaken without using metamathematical arguments, for example arguments based on the general syntactic structure of a formula. Isabelle's automation replaces the metamathematics, although it does not eliminate the requirement at least to state many tedious results that would otherwise be unnecessary.

This formalization [4] is by far the deepest result in set theory proved in any automated theorem prover. It rests on a previous formal development of the reflection theorem [3].

Contents

1	First-Order Formulas and the Definition of the Class L	10
1.1	Internalized formulas of FOL	10
1.2	Dividing line between primitive and derived connectives . .	12

1.7 Internalized Formulas for the Ordinals

The *sats* theorems below differ from the usual form in that they include an element of absoluteness. That is, they relate internalized formulas to real concepts such as the subset relation, rather than to the relativized concepts defined in theory *Relative*. This lets us prove the theorem as *Ords_in_DPow* without first having to instantiate the locale *M_trivial*. Note that the present theory does not even take *Relative* as a parent.

1.7.1 The subset relation

definition

```
subset_fm :: "[i,i]⇒i" where
  "subset_fm(x,y) ≡ Forall(Implies(Member(0,succ(x)), Member(0,succ(y))))"
```

```
lemma subset_type [TC]: "[x ∈ nat; y ∈ nat] ⇒ subset_fm(x,y) ∈ formula"

```

2.5 Introducing a Transitive Class Model

The class M is assumed to be transitive and inhabited

locale *M_trans* =

```

  fixes M
  assumes transM: "[y∈x; M(x)] ⇒ M(y)"
  and M_inhabited: "∃x . M(x)"

```

lemma (in *M_trans*) *nonempty [simp]: "M(0)"*

proof -

```

  have "M(x) → M(0)" for x
  proof (rule_tac P="λw. M(w) → M(0)" in eps_induct)
    {
      fix x
      assume "∀y∈x. M(y) → M(0)" "M(x)"
      consider (a) "∃y. y∈x" | (b) "x=0" by auto
      then
      have "M(x) → M(0)"
      proof cases
        case a
          then show ?thesis using <∀y∈x._> <M(x)> transM by auto
        next
          case b
            then show ?thesis by simp
      qed
    }
  then show "M(x) → M(0)" if "∀y∈x. M(y) → M(0)" for x
    using that by auto
  qed

```

```

with M_inhabited
show "M(0)" using M_inhabited by blast
qed

```

The class M is assumed to be transitive and to satisfy some relativized ZF axioms

```

locale M_trivial = M_trans +
  assumes upair_ax:      "upair_ax(M)"
  and Union_ax:         "Union_ax(M)"

lemma (in M_trans) rall_abs [simp]:
  "M(A)  $\implies$  ( $\forall x[M]. x \in A \longrightarrow P(x)$ )  $\longleftrightarrow$  ( $\forall x \in A. P(x)$ )"
by (blast intro: transM)

lemma (in M_trans) rex_abs [simp]:

3 Relativized Wellorderings

theory *Wellorderings* imports *Relative* begin

We define functions analogous to *ordermap ordertype* but without using recursion. Instead, there is a direct appeal to Replacement. This will be the basis for a version relativized to some class M . The main result is Theorem I 7.6 in Kunen, page 17.

3.1 Wellorderings

definition

irreflexive :: "[$i \Rightarrow o, i, i \Rightarrow o$]" where
 $"irreflexive(M, A, r) \equiv \forall x[M]. x \in A \longrightarrow \langle x, x \rangle \notin r"$

definition

transitive_rel :: "[$i \Rightarrow o, i, i \Rightarrow o$]" where
 $"transitive_rel(M, A, r) \equiv$
 $\forall x[M]. x \in A \longrightarrow (\forall y[M]. y \in A \longrightarrow (\forall z[M]. z \in A \longrightarrow$
 $\langle x, y \rangle \in r \longrightarrow \langle y, z \rangle \in r \longrightarrow \langle x, z \rangle \in r))"$

definition

linear_rel :: "[$i \Rightarrow o, i, i \Rightarrow o$]" where
 $"linear_rel(M, A, r) \equiv$
 $\forall x[M]. x \in A \longrightarrow (\forall y[M]. y \in A \longrightarrow \langle x, y \rangle \in r \mid x = y \mid \langle y, x \rangle \in r)"$

definition

wellfounded :: "[$i \Rightarrow o, i \Rightarrow o$]" where
 — EVERY non-empty set has an r -minimal element
 $"wellfounded(M, r) \equiv$
 $\forall x[M]. x \neq 0 \longrightarrow (\exists y[M]. y \in x \wedge \neg(\exists z[M]. z \in x \wedge \langle z, y \rangle \in r))"$

definition

wellfounded_on :: "[$i \Rightarrow o, i, i \Rightarrow o$]" where
 — every non-empty SUBSET OF A has an r -minimal element
 $"wellfounded_on(M, A, r) \equiv$
 $\forall x[M]. x \neq 0 \longrightarrow x \subseteq A \longrightarrow (\exists y[M]. y \in x \wedge \neg(\exists z[M]. z \in x \wedge \langle z, y \rangle$
 $\in r))"$

definition

wellordered :: "[$i \Rightarrow o, i, i \Rightarrow o$]" where
 — linear and wellfounded on A
 $"wellordered(M, A, r) \equiv$
 $transitive_rel(M, A, r) \wedge linear_rel(M, A, r) \wedge wellfounded_on(M, A, r)"$

8 The Reflection Theorem

theory *Reflection* imports *Normal* begin

lemma *all_iff_not_ex_not*: " $(\forall x. P(x)) \longleftrightarrow (\neg (\exists x. \neg P(x)))$ "
by *blast*

lemma *ball_iff_not_bex_not*: " $(\forall x \in A. P(x)) \longleftrightarrow (\neg (\exists x \in A. \neg P(x)))$ "
by *blast*

From the notes of A. S. Kechris, page 6, and from Andrzej Mostowski, *Constructible Sets with Applications*, North-Holland, 1969, page 23.

8.1 Basic Definitions

First part: the cumulative hierarchy defining the class M . To avoid handling multiple arguments, we assume that $Mset(1)$ is closed under ordered pairing provided 1 is limit. Possibly this could be avoided: the induction hypothesis *Cl_reflects* (in locale *ex_reflection*) could be weakened to $\forall y \in Mset(a). \forall z \in Mset(a). P(\langle y, z \rangle) \longleftrightarrow Q(a, \langle y, z \rangle)$, removing most uses of *Pair_in_Mset*. But there isn't much point in doing so, since ultimately the *ex_reflection* proof is packaged up using the predicate *Reflects*.

```
locale reflection =
  fixes Mset and M and Reflects
  assumes Mset_mono_le : "mono_le_subset(Mset)"
    and Mset_cont      : "cont_Ord(Mset)"
    and Pair_in_Mset   : "[x ∈ Mset(a); y ∈ Mset(a); Limit(a)]
      ⇒ ⟨x,y⟩ ∈ Mset(a)"
  defines "M(x) ≡ ∃ a. Ord(a) ∧ x ∈ Mset(a)"
    and "Reflects(Cl,P,Q) ≡ Closed_Unbounded(Cl) ∧
      (∀ a. Cl(a) → (∀ x ∈ Mset(a). P(x) ↔ Q(a,x)))"
  fixes F0 — ordinal for a specific value y
  fixes FF — sup over the whole level, y ∈ Mset(a)
  fixes ClEx — Reflecting ordinals for the formula ∃ z. P
  defines "F0(P,y) ≡ μ b. (∃ z. M(z) ∧ P(⟨y,z⟩)) →
    (∃ z ∈ Mset(b). P(⟨y,z⟩))"
    and "FF(P) ≡ λ a. ⋃ y ∈ Mset(a). F0(P,y)"
    and "ClEx(P,a) ≡ Limit(a) ∧ normalize(FF(P),a) = a"
```

begin

lemma *Mset_mono*: " $i \leq j \implies Mset(i) \subseteq Mset(j)$ "
using *Mset_mono_le* by (simp add: *mono_le_subset_def* *leI*)

Awkward: we need a version of `ClEx_def` as an equality at the level of classes, which do not really exist

```
lemma ClEx_eq:
  "ClEx(P)  $\equiv$   $\lambda a. \text{Limit}(a) \wedge \text{normalize}(\text{FF}(P), a) = a$ "
by (simp add: ClEx_def [symmetric])

```

And again, this time using class-bounded quantifiers

```

theorem Rex_reflection [intro]:
  "Reflects(Cl,  $\lambda x. P(fst(x),snd(x))$ ,  $\lambda a x. Q(a,fst(x),snd(x))$ )
    $\implies$  Reflects( $\lambda a. Cl(a) \wedge ClEx(\lambda x. P(fst(x),snd(x)), a),$ 
                  $\lambda x. \exists z[M]. P(x,z),$ 

```

```

       $\lambda a \ x. \exists z \in \text{Mset}(a). Q(a, x, z))"$ 
by (unfold rex_def, blast)

theorem Rall_reflection [intro]:
  "Reflects(Cl,  $\lambda x. P(\text{fst}(x), \text{snd}(x))$ ,  $\lambda a \ x. Q(a, \text{fst}(x), \text{snd}(x))$ )
 $\implies \text{Reflects}(\lambda a. \text{Cl}(a) \wedge \text{ClEx}(\lambda x. \neg P(\text{fst}(x), \text{snd}(x)), a),$ 
 $\lambda x. \forall z[M]. P(x, z),$ 
 $\lambda a \ x. \forall z \in \text{Mset}(a). Q(a, x, z))"$ 
by (unfold rall_def, blast)

```

No point considering bounded quantifiers, where reflection is trivial.

8.5 Simple Examples of Reflection

Example 1: reflecting a simple formula. The reflecting class is first given as the variable `?Cl` and later retrieved from the final proof state.

```

schematic_goal
  "Reflects(?Cl,
     $\lambda x. \exists y. M(y) \wedge x \in y,$ 
 $\lambda a \ x. \exists y \in \text{Mset}(a). x \in y)"$ 
by fast

```

Problem here: there needs to be a conjunction (class intersection) in the class of reflecting ordinals. The $\text{Ord}(a)$ is redundant, though harmless.

```

lemma

10.4.10 Variants of Satisfaction Definitions for Ordinals, etc.

The *sats* theorems below are standard versions of the ones proved in theory *Formula*. They relate elements of type *formula* to relativized concepts such as *subset* or *ordinal* rather than to real concepts such as *Ord*. Now that we have instantiated the locale *M_trivial*, we no longer require the earlier versions.

14.4.4 The Operator *is_Collect*

The formula *is_P* has one free variable, 0, and it is enclosed within a single quantifier.

definition

```

Collect_fm :: "[i, i, i]⇒i" where
"Collect_fm(A, is_P, z) ≡
  Forall(Iff(Member(0, succ(z)),
    And(Member(0, succ(A)), is_P)))"

```

```

lemma is_Collect_type [TC]:
  "[[is_P ∈ formula; x ∈ nat; y ∈ nat]]
  ⇒ Collect_fm(x, is_P, y) ∈ formula"
by (simp add: Collect_fm_def)

```

```

lemma sats_Collect_fm:
  assumes is_P_iff_sats:
    "∧a. a ∈ A ⇒ is_P(a) ↔ sats(A, p, Cons(a, env))"
  shows
    "[[x ∈ nat; y ∈ nat; env ∈ list(A)]
    ⇒ sats(A, Collect_fm(x, p, y), env) ↔
      is_Collect(##A, nth(x, env), is_P, nth(y, env))]"
by (simp add: Collect_fm_def is_Collect_def is_P_iff_sats [THEN iff_sym])

```

```

lemma Collect_iff_sats:
  assumes is_P_iff_sats:
    "∧a. a ∈ A ⇒ is_P(a) ↔ sats(A, p, Cons(a, env))"
  shows
    "[[nth(i, env) = x; nth(j, env) = y;
      i ∈ nat; j ∈ nat; env ∈ list(A)]
    ⇒ is_Collect(##A, x, is_P, y) ↔ sats(A, Collect_fm(i, p, j), env)]"
by (simp add: sats_Collect_fm [OF is_P_iff_sats])

```

The second argument of *is_P* gives it direct access to *x*, which is essential for handling free variable references.

theorem *Collect_reflection*:

```

assumes is_P_reflection:
  "∧h f g. REFLECTS[λx. is_P(L, f(x), g(x)),
    λi x. is_P(##Lset(i), f(x), g(x))]"
shows "REFLECTS[λx. is_Collect(L, f(x), is_P(L, x), g(x)),

15.2 An Injection from Formulas into the Natural Numbers

There is a well-known bijection between $\text{nat} \times \text{nat}$ and nat given by the expression $f(m,n) = \text{triangle}(m+n) + m$, where $\text{triangle}(k)$ enumerates the triangular numbers and can be defined by $\text{triangle}(0)=0$, $\text{triangle}(\text{succ}(k)) = \text{succ}(k + \text{triangle}(k))$. Some small amount of effort is needed to show that f is a bijection. We already know that such a bijection exists by the theorem *well_ord_InfCard_square_eq*:

$\llbracket \text{well_ord}(A, r); \text{InfCard}(|A|) \rrbracket \implies A \times A \approx A$

However, this result merely states that there is a bijection between the two sets. It provides no means of naming a specific bijection. Therefore, we conduct the proofs under the assumption that a bijection exists. The simplest way to organize this is to use a locale.

Locale for any arbitrary injection between $\text{nat} \times \text{nat}$ and nat

```

locale Nat_Times_Nat =
  fixes fn
  assumes fn_inj: "fn ∈ inj(nat*nat, nat)"

consts   enum :: "[i,i]⇒i"

15.3 Defining the Wellordering on $DPow(A)$

The objective is to build a wellordering on $DPow(A)$ from a given one on A . We first introduce wellorderings for environments, which are lists built over A . We combine it with the enumeration of formulas. The order type of the resulting wellordering gives us a map from (environment, formula) pairs into the ordinals. For each member of $DPow(A)$, we take the minimum such ordinal.

definition

```

env_form_r :: "[i,i,i] \Rightarrow i" where
  — wellordering on (environment, formula) pairs
  "env_form_r(f,r,A) \equiv
    rmult(list(A), rlist(A, r),
          formula, measure(formula, enum(f)))"

```

definition

```
env_form_map :: "[i,i,i,i]⇒i" where
  — map from (environment, formula) pairs to ordinals
  "env_form_map(f,r,A,z)
    ≡ ordermap(list(A) * formula, env_form_r(f,r,A)) ‘ z"
```

definition

```
DPow_ord :: "[i,i,i,i,i]⇒o" where
  — predicate that holds if k is a valid index for X
  "DPow_ord(f,r,A,X,k) ≡
    ∃ env ∈ list(A). ∃ p ∈ formula.
      arity(p) ≤ succ(length(env)) ∧
      X = {x∈A. sats(A, p, Cons(x,env))} ∧
      env_form_map(f,r,A,⟨env,p⟩) = k"
