## 1 A simple formulation of First-Order Logic

The subsequent theory development illustrates single-sorted intuitionistic first-order logic with equality, formulated within the Pure framework.

```
theory First_Order_Logic
  imports Pure
begin
```

### 1.1 Abstract syntax

```
typedcl i
typedcl o
```

```
judgment Trueprop :: o  $\Rightarrow$  prop ( $\langle \_ \rangle$  5)
```

### 1.2 Propositional logic

```
axiomatization false :: o ( $\langle \bot \rangle$ )
  where falseE [elim]:  $\bot \Longrightarrow A$ 
```

```
axiomatization imp :: o  $\Rightarrow$  o  $\Rightarrow$  o (infixr  $\langle \longrightarrow \rangle$  25)
  where impI [intro]:  $(A \Longrightarrow B) \Longrightarrow A \longrightarrow B$ 
    and mp [dest]:  $A \longrightarrow B \Longrightarrow A \Longrightarrow B$ 
```

```
axiomatization conj :: o  $\Rightarrow$  o  $\Rightarrow$  o (infixr  $\langle \wedge \rangle$  35)
  where conjI [intro]:  $A \Longrightarrow B \Longrightarrow A \wedge B$ 
    and conjD1:  $A \wedge B \Longrightarrow A$ 
    and conjD2:  $A \wedge B \Longrightarrow B$ 
```

```
theorem conjE [elim]:
  assumes  $A \wedge B$ 
  obtains  $A$  and  $B$ 
 $\langle proof \rangle$ 
```

**axiomatization** *disj* ::  $o \Rightarrow o \Rightarrow o$  (**infixr**  $\langle \vee \rangle$  30)  
 where *disjE* [*elim*]:  $A \vee B \Rightarrow (A \Rightarrow C) \Rightarrow (B \Rightarrow C) \Rightarrow C$   
 and *disjI1* [*intro*]:  $A \Rightarrow A \vee B$   
 and *disjI2* [*intro*]:  $B \Rightarrow A \vee B$

**definition** *true* ::  $o$  ( $\langle \top \rangle$ )  
 where  $\top \equiv \perp \longrightarrow \perp$

**theorem** *trueI* [*intro*]:  $\top$   
 $\langle proof \rangle$

**definition** *not* ::  $o \Rightarrow o$  ( $\langle \neg \_ \rangle$  [40] 40)  
 where  $\neg A \equiv A \longrightarrow \perp$

**theorem** *notI* [*intro*]:  $(A \Rightarrow \perp) \Rightarrow \neg A$   
 $\langle proof \rangle$

**theorem** *notE* [*elim*]:  $\neg A \Rightarrow A \Rightarrow B$   
 $\langle proof \rangle$

**definition** *iff* ::  $o \Rightarrow o \Rightarrow o$  (**infixr**  $\langle \longleftrightarrow \rangle$  25)  
 where  $A \longleftrightarrow B \equiv (A \longrightarrow B) \wedge (B \longrightarrow A)$

**theorem** *iffI* [*intro*]:  
 assumes  $A \Rightarrow B$   
 and  $B \Rightarrow A$   
 shows  $A \longleftrightarrow B$   
 $\langle proof \rangle$

**theorem** *iff1* [*elim*]:  
 assumes  $A \longleftrightarrow B$  and  $A$   
 shows  $B$   
 $\langle proof \rangle$

**theorem** *iff2* [*elim*]:  
 assumes  $A \longleftrightarrow B$  and  $B$   
 shows  $A$   
 $\langle proof \rangle$

### 1.3 Equality

**axiomatization** *equal* ::  $i \Rightarrow i \Rightarrow o$  (**infixl**  $\langle = \rangle$  50)  
 where *refl* [*intro*]:  $x = x$   
 and *subst*:  $x = y \Rightarrow P\ x \Rightarrow P\ y$

**theorem** *trans* [*trans*]:  $x = y \implies y = z \implies x = z$   
 ⟨*proof*⟩

**theorem** *sym* [*sym*]:  $x = y \implies y = x$   
 ⟨*proof*⟩

## 1.4 Quantifiers

**axiomatization** *All* ::  $(i \Rightarrow o) \Rightarrow o$  (**binder** ⟨ $\forall$ ⟩ 10)  
**where** *allI* [*intro*]:  $(\bigwedge x. P\ x) \implies \forall x. P\ x$   
**and** *allD* [*dest*]:  $\forall x. P\ x \implies P\ a$

**axiomatization** *Ex* ::  $(i \Rightarrow o) \Rightarrow o$  (**binder** ⟨ $\exists$ ⟩ 10)  
**where** *exI* [*intro*]:  $P\ a \implies \exists x. P\ x$   
**and** *exE* [*elim*]:  $\exists x. P\ x \implies (\bigwedge x. P\ x \implies C) \implies C$

**lemma**  $(\exists x. P\ (f\ x)) \longrightarrow (\exists y. P\ y)$   
 ⟨*proof*⟩

**lemma**  $(\exists x. \forall y. R\ x\ y) \longrightarrow (\forall y. \exists x. R\ x\ y)$   
 ⟨*proof*⟩

**end**

## 2 Foundations of HOL

**theory** *Higher\_Order\_Logic*  
**imports** *Pure*  
**begin**

The following theory development illustrates the foundations of Higher-Order Logic. The “HOL” logic that is given here resembles [2] and its predecessor [1], but the order of axiomatizations and defined connectives has been adapted to modern presentations of  $\lambda$ -calculus and Constructive Type Theory. Thus it fits nicely to the underlying Natural Deduction framework of Isabelle/Pure and Isabelle/Isar.

## 3 HOL syntax within Pure

**class** *type*  
**default\_sort** *type*

**typeddecl** *o*  
**instance** *o* :: *type* ⟨*proof*⟩  
**instance** *fun* :: (*type*, *type*) *type* ⟨*proof*⟩

**judgment** *Trueprop* ::  $o \Rightarrow prop$  (⟨ $\_$ ⟩ 5)

## 4 Minimal logic (axiomatization)

**axiomatization** *imp* ::  $o \Rightarrow o \Rightarrow o$  (**infixr**  $\langle \longrightarrow \rangle$  25)  
 where *impI* [*intro*]:  $(A \Longrightarrow B) \Longrightarrow A \longrightarrow B$   
 and *impE* [*dest*, *trans*]:  $A \longrightarrow B \Longrightarrow A \Longrightarrow B$

**axiomatization** *All* ::  $('a \Rightarrow o) \Rightarrow o$  (**binder**  $\langle \forall \rangle$  10)  
 where *allI* [*intro*]:  $(\bigwedge x. P\ x) \Longrightarrow \forall x. P\ x$   
 and *allE* [*dest*]:  $\forall x. P\ x \Longrightarrow P\ a$

**lemma** *atomize\_imp* [*atomize*]:  $(A \Longrightarrow B) \equiv \text{Trueprop } (A \longrightarrow B)$   
 $\langle \text{proof} \rangle$

**lemma** *atomize\_all* [*atomize*]:  $(\bigwedge x. P\ x) \equiv \text{Trueprop } (\forall x. P\ x)$   
 $\langle \text{proof} \rangle$

### 4.0.1 Derived connectives

**definition** *False* ::  $o$   
 where *False*  $\equiv \forall A. A$

**lemma** *FalseE* [*elim*]:  
 assumes *False*  
 shows *A*  
 $\langle \text{proof} \rangle$

**definition** *True* ::  $o$   
 where *True*  $\equiv \text{False} \longrightarrow \text{False}$

**lemma** *TrueI* [*intro*]: *True*  
 $\langle \text{proof} \rangle$

**definition** *not* ::  $o \Rightarrow o$  ( $\langle \neg \_ \rangle$  [40] 40)  
 where *not*  $\equiv \lambda A. A \longrightarrow \text{False}$

**lemma** *notI* [*intro*]:  
 assumes  $A \Longrightarrow \text{False}$   
 shows  $\neg A$   
 $\langle \text{proof} \rangle$

**lemma** *notE* [*elim*]:  
 assumes  $\neg A$  and *A*  
 shows *B*  
 $\langle \text{proof} \rangle$

**lemma** *notE'*:  $A \Longrightarrow \neg A \Longrightarrow B$   
 $\langle \text{proof} \rangle$

**lemmas** *contradiction* = *notE notE'* — proof by contradiction in any order

**definition** *conj* ::  $o \Rightarrow o \Rightarrow o$  (**infixr**  $\langle \wedge \rangle$  35)  
where  $A \wedge B \equiv \forall C. (A \longrightarrow B \longrightarrow C) \longrightarrow C$

**lemma** *conjI* [*intro*]:  
assumes *A* and *B*  
shows  $A \wedge B$   
 $\langle proof \rangle$

**lemma** *conjE* [*elim*]:  
assumes  $A \wedge B$   
obtains *A* and *B*  
 $\langle proof \rangle$

**definition** *disj* ::  $o \Rightarrow o \Rightarrow o$  (**infixr**  $\langle \vee \rangle$  30)  
where  $A \vee B \equiv \forall C. (A \longrightarrow C) \longrightarrow (B \longrightarrow C) \longrightarrow C$

**lemma** *disjI1* [*intro*]:  
assumes *A*  
shows  $A \vee B$   
 $\langle proof \rangle$

**lemma** *disjI2* [*intro*]:  
assumes *B*  
shows  $A \vee B$   
 $\langle proof \rangle$

**lemma** *disjE* [*elim*]:  
assumes  $A \vee B$   
obtains  $(a) A \mid (b) B$   
 $\langle proof \rangle$

**definition** *Ex* ::  $('a \Rightarrow o) \Rightarrow o$  (**binder**  $\langle \exists \rangle$  10)  
where  $\exists x. P x \equiv \forall C. (\forall x. P x \longrightarrow C) \longrightarrow C$

**lemma** *exI* [*intro*]:  $P a \Longrightarrow \exists x. P x$   
 $\langle proof \rangle$

**lemma** *exE* [*elim*]:  
assumes  $\exists x. P x$   
obtains  $(that) x$  where  $P x$   
 $\langle proof \rangle$

#### 4.0.2 Extensional equality

**axiomatization** *equal* :: 'a  $\Rightarrow$  'a  $\Rightarrow$  o (infixl  $\langle \Rightarrow \rangle$  50)

where *refl* [intro]:  $x = x$   
and *subst*:  $x = y \Longrightarrow P\ x \Longrightarrow P\ y$

**abbreviation** *not\_equal* :: 'a  $\Rightarrow$  'a  $\Rightarrow$  o (infixl  $\langle \neq \rangle$  50)

where  $x \neq y \equiv \neg (x = y)$

**abbreviation** *iff* :: o  $\Rightarrow$  o  $\Rightarrow$  o (infixr  $\langle \longleftrightarrow \rangle$  25)

where  $A \longleftrightarrow B \equiv A = B$

**axiomatization**

where *ext* [intro]:  $(\bigwedge x. f\ x = g\ x) \Longrightarrow f = g$   
and *iff* [intro]:  $(A \Longrightarrow B) \Longrightarrow (B \Longrightarrow A) \Longrightarrow A \longleftrightarrow B$   
for  $f\ g :: 'a \Rightarrow 'b$

**lemma** *sym* [sym]:  $y = x$  if  $x = y$   
*<proof>*

**lemma** [trans]:  $x = y \Longrightarrow P\ y \Longrightarrow P\ x$   
*<proof>*

**lemma** [trans]:  $P\ x \Longrightarrow x = y \Longrightarrow P\ y$   
*<proof>*

**lemma** *arg\_cong*:  $f\ x = f\ y$  if  $x = y$   
*<proof>*

**lemma** *fun\_cong*:  $f\ x = g\ x$  if  $f = g$   
*<proof>*

**lemma** *trans* [trans]:  $x = y \Longrightarrow y = z \Longrightarrow x = z$   
*<proof>*

**lemma** *iff1* [elim]:  $A \longleftrightarrow B \Longrightarrow A \Longrightarrow B$   
*<proof>*

**lemma** *iff2* [elim]:  $A \longleftrightarrow B \Longrightarrow B \Longrightarrow A$   
*<proof>*

#### 4.1 Cantor's Theorem

Cantor's Theorem states that there is no surjection from a set to its powerset. The subsequent formulation uses elementary  $\lambda$ -calculus and predicate logic, with standard introduction and elimination rules.

**lemma** *iff\_contradiction*:  
assumes \*:  $\neg A \longleftrightarrow A$   
shows  $C$

$\langle proof \rangle$

**theorem** *Cantor*:  $\neg (\exists f :: 'a \Rightarrow 'a \Rightarrow o. \forall A. \exists x. A = f\ x)$   
 $\langle proof \rangle$

## 4.2 Characterization of Classical Logic

The subsequent rules of classical reasoning are all equivalent.

**locale** *classical* =  
  **assumes** *classical*:  $(\neg A \Longrightarrow A) \Longrightarrow A$   
  — predicate definition and hypothetical context  
**begin**

**lemma** *classical\_contradiction*:  
  **assumes**  $\neg A \Longrightarrow False$   
  **shows**  $A$   
 $\langle proof \rangle$

**lemma** *double\_negation*:  
  **assumes**  $\neg \neg A$   
  **shows**  $A$   
 $\langle proof \rangle$

**lemma** *tertium\_non\_datur*:  $A \vee \neg A$   
 $\langle proof \rangle$

**lemma** *classical\_cases*:  
  **obtains**  $A \mid \neg A$   
 $\langle proof \rangle$

**end**

**lemma** *classical\_if\_cases*: *classical*  
  **if cases**:  $\bigwedge A\ C. (A \Longrightarrow C) \Longrightarrow (\neg A \Longrightarrow C) \Longrightarrow C$   
 $\langle proof \rangle$

## 5 Peirce's Law

Peirce's Law is another characterization of classical reasoning. Its statement only requires implication.

**theorem** (**in** *classical*) *Peirce's\_Law*:  $((A \longrightarrow B) \longrightarrow A) \longrightarrow A$   
 $\langle proof \rangle$

## 6 Hilbert's choice operator (axiomatization)

**axiomatization** *Eps* ::  $('a \Rightarrow o) \Rightarrow 'a$   
  **where** *someI*:  $P\ x \Longrightarrow P\ (Eps\ P)$

```

syntax _Eps :: pttrn  $\Rightarrow$  o  $\Rightarrow$  'a  (⟨⟨indent=3 notation=⟨binder SOME⟩⟩SOME
_./ _⟩ [0, 10] 10)
syntax_consts _Eps  $\equiv$  Eps
translations SOME x. P  $\equiv$  CONST Eps ( $\lambda x$ . P)

```

It follows a derivation of the classical law of tertium-non-datur by means of Hilbert's choice operator (due to Berghofer, Beeson, Harrison, based on a proof by Diaconescu).

**theorem** *Diaconescu*:  $A \vee \neg A$   
 ⟨*proof*⟩

This means, the hypothetical predicate *classical* always holds unconditionally (with all consequences).

**interpretation** *classical*  
 ⟨*proof*⟩

**thm** *classical*  
*classical\_contradiction*  
*double\_negation*  
*tertium\_non\_datur*  
*classical\_cases*  
*Peirce's\_Law*

**end**
