## Isabelle/HOL — Higher-Order Logic

May 23, 2024

### Contents

1. Loading the code generator and related modules 33

2. The basis of Higher-Order Logic 34
   
   2.1. Primitive logic .......................... 35
   
   2.1.1. Core syntax .......................... 35
   2.1.2. Defined connectives and quantifiers ........ 36
   2.1.3. Additional concrete syntax ................ 36
   2.1.4. Axioms and basic definitions .......... 38

2.2. Fundamental rules ......................... 39
   
   2.2.1. Equality ............................. 39
   2.2.2. Congruence rules for application ........ 39
   2.2.3. Equality of booleans – iff ............. 40
   2.2.4. True (1) ............................. 40
   2.2.5. Universal quantifier (1) ................ 40
   2.2.6. False ................................ 40
   2.2.7. Negation .............................. 41
   2.2.8. Implication ........................... 41
   2.2.9. Disjunction (1) ........................ 42
   2.2.10. Derivation of $iff$ ................ 42
   2.2.11. True (2) ............................. 42
   2.2.12. Universal quantifier (2) ............. 43
   2.2.13. Existential quantifier ............... 43
   2.2.14. Conjunction .......................... 43
   2.2.15. Disjunction (2) ........................ 43
   2.2.16. Classical logic ........................ 44
   2.2.17. Unique existence ..................... 44
   2.2.18. Classical intro rules for disjunction and existential quantifiers 45
   2.2.19. Intuitionistic Reasoning ................ 46
   2.2.20. Atomizing meta-level connectives ........ 47
   2.2.21. Atomizing elimination rules ............ 48
2.3 Package setup ................................................. 48
  2.3.1 Sledgehammer setup ..................................... 49
  2.3.2 Classical Reasoner setup ................................. 49
  2.3.3 THE: definite description operator ....................... 51
  2.3.4 Simplifier ................................................ 52
  2.3.5 Generic cases and induction .............................. 63
  2.3.6 Coherent logic .......................................... 66
  2.3.7 Reorienting equalities .................................. 66
  2.4 Other simple lemmas and lemma duplicates .................... 67
  2.5 Basic ML bindings ......................................... 68

3 NO-MATCH simproc .............................................. 70
  3.1 Code generator setup ....................................... 71
    3.1.1 Generic code generator preprocessor setup .......... 71
    3.1.2 Equality ............................................. 72
    3.1.3 Generic code generator foundation .................... 72
    3.1.4 Generic code generator target languages ............. 74
    3.1.5 Evaluation and normalization by evaluation ........... 76
  3.2 Counterexample Search Units ............................... 76
    3.2.1 Quickcheck ........................................... 76
    3.2.2 Nitpick setup ......................................... 76
  3.3 Preprocessing for the predicate compiler ................... 76
  3.4 Legacy tactics and ML bindings ............................. 77

4 Abstract orderings ............................................ 77
  4.1 Abstract ordering .......................................... 77
  4.2 Syntactic orders .......................................... 81
  4.3 Quasi orders .............................................. 81
  4.4 Partial orders ............................................ 83
  4.5 Linear (total) orders ..................................... 85
  4.6 Reasoning tools setup ..................................... 87
  4.7 Bounded quantifiers ....................................... 91
  4.8 Transitivity reasoning ..................................... 93
  4.9 min and max – fundamental ................................ 99
  4.10 (Unique) top and bottom elements ......................... 99
  4.11 Dense orders ............................................. 101
  4.12 Wellorders ............................................... 103
  4.13 Order on bool ............................................ 104
  4.14 Order on - ⇒ - ........................................... 105
  4.15 Order on unary and binary predicates ..................... 107
  4.16 Name duplicates .......................................... 108
# Groups, also combined with orderings

5.1 Dynamic facts ........................................ 109
5.2 Abstract structures .................................. 109
5.3 Generic operations .................................. 112
5.4 Semigroups and Monoids ............................. 113
5.5 Groups .................................................. 117
5.6 (Partially) Ordered Groups .......................... 121
5.7 Support for reasoning about signs ................. 123
5.8 Canonically ordered monoids ......................... 136
5.9 Tools setup ............................................ 138

# Abstract lattices

6.1 Abstract semilattice .................................. 139
6.2 Syntactic infimum and supremum operations .... 142
6.3 Concrete lattices ..................................... 142
   6.3.1 Intro and elim rules ........................... 143
   6.3.2 Equational laws ............................... 144
   6.3.3 Strict order ..................................... 147
6.4 Distributive lattices ................................ 147
6.5 Bounded lattices ..................................... 148
6.6 min/max as special case of lattice ................. 150
6.7 Uniqueness of inf and sup .......................... 151
6.8 Lattice on \(-\Rightarrow-\) ............................. 152

# Boolean Algebras

7.1 Abstract boolean algebra ............................ 153
   7.1.1 Complement .................................... 154
   7.1.2 Conjunction .................................... 155
   7.1.3 Disjunction .................................... 156
   7.1.4 De Morgan’s Laws .............................. 156
7.2 Symmetric Difference ................................. 157
7.3 Type classes .......................................... 159
7.4 Lattice on bool ...................................... 161
7.5 Lattice on unary and binary predicates .......... 162
7.6 Simproc setup .......................................

# Set theory for higher-order logic

8.1 Sets as predicates .................................... 165
8.2 Subsets and bounded quantifiers .................... 167
8.3 Basic operations ..................................... 173
   8.3.1 Subsets ....................................... 173
   8.3.2 Equality ....................................... 174
   8.3.3 The empty set .................................. 175
   8.3.4 The universal set – UNIV ...................... 175

11.5 Complete lattice on unary and binary predicates 251
11.6 Complete lattice on - set 252
11.6.1 Inter 253
11.6.2 Intersections of families 254
11.6.3 Union 256
11.6.4 Unions of families 257
11.6.5 Distributive laws 260
11.7 Injections and bijections 261
11.7.1 Complement 263
11.7.2 Miniscoping and maxiscoping 263

12 Wrapping Existing Freely Generated Type’s Constructors 265

13 Knaster-Tarski Fixpoint Theorem and inductive definitions 266
13.1 Least fixed points 266
13.2 General induction rules for least fixed points 267
13.3 Greatest fixed points 268
13.4 Coinduction rules for greatest fixed points 269
13.5 Even Stronger Coinduction Rule, by Martin Coen 271
13.6 Rules for fixed point calculus 272
13.7 Inductive predicates and sets 274
13.8 The Schroeder-Bernstein Theorem 274
13.9 Inductive datatypes and primitive recursion 276

14 Cartesian products 277
14.1 bool is a datatype 277
14.2 The unit type 278
14.3 The product type 280
14.3.1 Type definition 280
14.3.2 Tuple syntax 282
14.3.3 Code generator setup 284
14.3.4 Fundamental operations and properties 284
14.3.5 Derived operations 291
14.4 Simproc for rewriting a set comprehension into a pointfree expression 302
14.5 Lemmas about disjointness 302
14.6 Inductively defined sets 303
14.7 Legacy theorem bindings and duplicates 303

15 The Disjoint Sum of Two Types 304
15.1 Construction of the sum type and its basic abstract operations 304
15.2 Projections 307
15.3 The Disjoint Sum of Sets 308
16 Rings
  16.1 Semirings and rings ........................................ 309
  16.2 Abstract divisibility ........................................ 311
  16.3 Towards integral domains .................................... 317
  16.4 (Partial) Division ........................................... 322
  16.5 Quotient and remainder in integral domains ............... 345
  16.6 Interlude: basic tool support for algebraic and arithmetic calculations ........................................ 346
  16.7 Ordered semirings and rings .................................. 347
  16.8 Dioids .......................................................... 366

17 Natural numbers
  17.1 Type ind ....................................................... 366
  17.2 Type nat ........................................................ 366
  17.3 Arithmetic operators .......................................... 370
    17.3.1 Addition .................................................. 372
    17.3.2 Difference ............................................... 373
    17.3.3 Multiplication .......................................... 373
  17.4 Orders on nat .................................................. 374
    17.4.1 Operation definition .................................... 374
    17.4.2 Introduction properties ................................ 376
    17.4.3 Elimination properties .................................. 376
    17.4.4 Inductive (?) properties ................................ 377
    17.4.5 Monotonicity of Addition ................................ 381
    17.4.6 min and max ............................................. 383
    17.4.7 Additional theorems about (≤) ........................... 385
    17.4.8 More results about difference ........................... 391
    17.4.9 Monotonicity of multiplication .......................... 393
  17.5 Natural operation of natural numbers on functions ........ 395
  17.6 Kleene iteration ............................................... 398
  17.7 Embedding of the naturals into any semiring-1: of-nat .... 400
  17.8 The set of natural numbers .................................... 404
  17.9 Further arithmetic facts concerning the natural numbers ... 405
    17.9.1 Greatest operator ........................................ 413
    17.10 Monotonicity of funpow .................................... 414
    17.11 The divides relation on nat ................................ 414
    17.12 Aliasses ..................................................... 416
    17.13 Size of a datatype value .................................... 417
    17.14 Code module namespace ..................................... 418

18 Fields
  18.1 Division rings ................................................. 418
  18.2 Fields .......................................................... 425
  18.3 Ordered fields ................................................ 429
19 Relations – as sets of pairs, and binary predicates

19.1 Fundamental ............................................. 446
19.1.1 Relations as sets of pairs .......................... 446
19.1.2 Conversions between set and predicate relations .... 446
19.2 Properties of relations ................................. 448
19.2.1 Reflexivity ............................................ 448
19.2.2 Irreflexivity ........................................... 451
19.2.3 Asymmetry ............................................ 452
19.2.4 Symmetry .............................................. 454
19.2.5 Antisymmetry ........................................ 456
19.2.6 Transitivity ........................................... 458
19.2.7 Totality ................................................ 461
19.2.8 Single valued relations ............................. 463
19.3 Relation operations ................................. 464
19.3.1 The identity relation ............................... 464
19.3.2 Diagonal: identity over a set ....................... 464
19.3.3 Composition ......................................... 465
19.3.4 Converse .............................................. 467
19.3.5 Domain, range and field ......................... 471
19.3.6 Image of a set under a relation .................. 474
19.3.7 Inverse image ....................................... 476
19.3.8 Powerset .............................................. 476

20 Finite sets

20.1 Predicate for finite sets ............................. 477
20.1.1 Choice principles .................................. 478
20.1.2 Finite sets are the images of initial segments of natural numbers .......................... 478
20.2 Finiteness and common set operations ............... 480
20.3 Further induction rules on finite sets ............... 489
20.4 Class finite ............................................ 491
20.5 A basic fold functional for finite sets ............... 492
20.5.1 From fold-graph to fold ......................... 494
20.5.2 Liftings to comp-fun-commute-on etc. ............ 500
20.5.3 UNIV as carrier set ............................... 501
20.5.4 Expressing set operations via fold ............... 503
20.5.5 Expressing relation operations via fold ........... 507
20.6 Locales as mini-packages for fold operations ....... 509
20.6.1 The natural case ................................. 509
20.6.2 With idempotency ............................... 510
20.6.3 UNIV as the carrier set ......................... 510
20.7 Finite cardinality .................................... 511
20.7.1 Cardinality of image ............................... 524
20.7.2 Pigeonhole Principles ............................. 526
20.7.3 Cardinality of sums ........................................... 527
20.8 Minimal and maximal elements of finite sets ................. 527
  20.8.1 Finite orders ............................................. 534
  20.8.2 Relating injectivity and surjectivity .................... 534
20.9 Infinite Sets .................................................. 536
20.10 The finite powerset operator .................................. 538

21 Reflexive and Transitive closure of a relation ............... 539
  21.1 Reflexive closure ............................................. 540
  21.2 Reflexive-transitive closure ................................. 541
  21.3 Transitive closure ........................................... 547
  21.4 Symmetric closure ............................................ 556
  21.5 The power operation on relations ............................ 557
  21.6 Bounded transitive closure .................................. 567
  21.7 Acyclic relations ............................................. 568
  21.8 Setup of transitivity reasoner ................................ 569

22 Well-founded Recursion ......................................... 571
  22.1 Basic Definitions ............................................. 571
  22.2 Equivalence of Definitions ................................... 571
  22.3 Induction Principles ......................................... 572
  22.4 Introduction Rules .......................................... 573
  22.5 Ordering Properties ......................................... 573
  22.6 Basic Results ................................................ 575
    22.6.1 Minimal-element characterization of well-foundedness 576
    22.6.2 Antimonotonicity ....................................... 577
    22.6.3 Well-foundedness of transitive closure ................. 578
    22.6.4 Well-foundedness of image ............................... 580
  22.7 Well-Foundedness Results for Unions ......................... 582
  22.8 Well-Foundedness of Composition ............................. 584
  22.9 Acyclic relations ............................................ 586
    22.9.1 Wellfoundedness of finite acyclic relations ........... 586
  22.10 nat is well-founded ........................................ 587
  22.11 Accessible Part ............................................. 588
  22.12 Tools for building wellfounded relations .................. 591
    22.12.1 Conversion to a known well-founded relation ......... 591
    22.12.2 Measure functions into nat ............................. 592
    22.12.3 Lexicographic combinations ............................. 593
    22.12.4 Bounded increase must terminate ....................... 597
  22.13 Code Generation Setup ..................................... 597

23 Well-Founded Recursion Combinator ......................... 598
  23.0.1 Well-founded recursion via genuine fixpoints .......... 599
  23.1 Wellfoundedness of same-fst ................................. 599
### 24 Orders as Relations

24.1 Orders on a set ............................................. 600
24.2 Orders on the field ........................................ 602
24.3 Relations given by a predicate and the field .......... 603
24.4 Orders on a type ........................................... 604
24.5 Order-like relations ....................................... 604
   24.5.1 Auxiliaries .......................................... 604
   24.5.2 The upper and lower bounds operators ........... 605
24.6 Variations on Well-Founded Relations ................. 608
   24.6.1 Characterizations of well-foundedness ............ 609
   24.6.2 Characterizations of well-foundedness .......... 611

### 25 Hilbert's Epsilon-Operator and the Axiom of Choice

25.1 Hilbert's epsilon ........................................... 613
25.2 Hilbert's Epsilon-operator ................................ 613
25.3 Axiom of Choice, Proved Using the Description Operator .. 614
25.4 Function Inverse .......................................... 615
25.5 Other Consequences of Hilbert’s Epsilon ............... 626
25.6 An aside: bounded accessible part .................... 627
25.7 More on injections, bijections, and inverses .......... 629
25.8 Specification package – Hilbertized version .......... 632
25.9 Complete Distributive Lattices – Properties depending on Hilbert Choice .................................. 632

### 26 Zorn’s Lemma and the Well-ordering Theorem

26.1 Zorn’s Lemma for the Subset Relation ................. 638
   26.1.1 Results that do not require an order ............. 638
   26.1.2 Hausdorff’s Maximum Principle .................... 644
   26.1.3 Results for the proper subset relation .......... 645
   26.1.4 Zorn’s lemma ........................................ 645
26.2 Zorn’s Lemma for Partial Orders ....................... 646
26.3 Other variants of Zorn’s Lemma ......................... 648
26.4 The Well Ordering Theorem ............................. 651

### 27 Well-Order Relations as Needed by Bounded Natural Functions

27.1 Auxiliaries ................................................. 657
27.2 Well-founded induction and recursion adapted to non-strict well-order relations ............................... 658
27.3 The notions of maximum, minimum, supremum, successor and order filter .................................. 658
   27.3.1 Properties of max2 .................................. 659
   27.3.2 Existence and uniqueness for isMinim and well-definedness of minim ............................... 660
27.3.3 Properties of minim ................................. 661
27.3.4 Properties of successor .............................. 662
27.3.5 Properties of order filters ......................... 663
27.3.6 Other properties .......................... 665

28 Well-Order Embeddings as Needed by Bounded Natural Functors 667
28.1 Auxiliaries ......................................... 668
28.2 (Well-order) embeddings, strict embeddings, isomorphisms and order-compatible functions ................................. 668
28.3 Given any two well-orders, one can be embedded in the other 677
28.4 Uniqueness of embeddings ............................... 683
28.5 More properties of embeddings, strict embeddings and isomorphisms .................................. 685

29 Constructions on Wellorders as Needed by Bounded Natural Functors 691
29.1 Restriction to a set .................................... 691
29.2 Order filters versus restrictions and embeddings ................................. 693
29.3 The strict inclusion on proper ofilters is well-founded ................. 697
29.4 Ordering the well-orders by existence of embeddings ................. 697
29.5 \(<\omega \) is well-founded .................................. 707
29.6 Copy via direct images .................................. 708
29.7 Bounded square ......................................... 712

30 Cardinal-Order Relations as Needed by Bounded Natural Functors 724
30.1 Cardinal orders ....................................... 725
30.2 Cardinal of a set ...................................... 726
30.3 Cardinals versus set operations on arbitrary sets .......... 731
30.4 Cardinals versus set operations involving infinite sets ........ 739
30.5 The cardinal \(\omega \) and the finite cardinals ............ 746
  30.5.1 First as well-orders ................................. 746
  30.5.2 Then as cardinals .................................. 747
30.6 The successor of a cardinal .............................. 748
30.7 Regular cardinals ...................................... 755
30.8 Others ................................................. 757
30.9 Regular vs. stable cardinals .................................. 759

31 Cardinal Arithmetic as Needed by Bounded Natural Functors 764
31.1 Zero ..................................................... 764
31.2 (In)finite cardinals ..................................... 765
31.3 Binary sum ............................................. 766
31.4 One ....................................................... 768
31.5 Two ....................................................... 769
31.6 Family sum ........................................... 769
31.7 Product ............................................... 769
31.8 Exponentiation ..................................... 773

32 Function Definition Base .................................. 781

33 Definition of Bounded Natural Functors .................... 781

34 Composition of Bounded Natural Functors ................... 787

35 Registration of Basic Types as Bounded Natural Functors .. 792

36 Shared Fixpoint Operations on Bounded Natural Functors .. 798

37 Least Fixpoint (Datatype) Operation on Bounded Natural Functors ........................................ 804

38 Equivalence Relations in Higher-Order Set Theory ............ 808
  38.1 Equivalence relations – set version ....................... 808
  38.2 Equivalence classes ................................... 809
  38.3 Quotients .............................................. 810
  38.4 Refinement of one equivalence relation WRT another .... 811
  38.5 Defining unary operations upon equivalence classes .... 812
  38.6 Defining binary operations upon equivalence classes ... 813
  38.7 Quotients and finiteness ................................ 815
  38.8 Projection ............................................. 815
  38.9 Equivalence relations – predicate version ............... 816
  38.10 Equivalence closure ................................... 818

39 MESON Proof Method ........................................ 823
  39.1 Negation Normal Form .................................. 823
  39.2 Pulling out the existential quantifiers .................... 823
  39.3 Lemmas for Forward Proof ............................... 824
  39.4 Clausification helper ................................... 825
  39.5 Skolemization helpers .................................. 826
  39.6 Meson package ........................................ 826

40 Automatic Theorem Provers (ATPs) .......................... 826
  40.1 ATP problems and proofs ............................... 827
  40.2 Higher-order reasoning helpers ......................... 827
  40.3 Basic connection between ATPs and HOL ................. 829
41 Metis Proof Method 829
   41.1 Literal selection and lambda-lifting helpers . . . . . . 830
   41.2 Metis package . . . . . . . . . . . . . . . . . . . . . . . 830

42 Generic theorem transfer using relations 831
   42.1 Relator for function space . . . . . . . . . . . . . . . . 831
   42.2 Transfer method . . . . . . . . . . . . . . . . . . . . . . 831
   42.3 Predicates on relations, i.e. “class constraints” . . . . . 832
   42.4 Properties of relators . . . . . . . . . . . . . . . . . . . 837
   42.5 Transfer rules . . . . . . . . . . . . . . . . . . . . . . . 839
   42.6 of-bool and of-nat . . . . . . . . . . . . . . . . . . . . . 844

43 Lifting package 845
   43.1 Function map . . . . . . . . . . . . . . . . . . . . . . . . 845
   43.2 Quotient Predicate . . . . . . . . . . . . . . . . . . . . . 845
   43.3 Quotient composition . . . . . . . . . . . . . . . . . . . . 849
   43.4 Respects predicate . . . . . . . . . . . . . . . . . . . . . . 849
   43.5 Domains . . . . . . . . . . . . . . . . . . . . . . . . . . . . 854
   43.6 ML setup . . . . . . . . . . . . . . . . . . . . . . . . . . . 856

44 Definition of Quotient Types 856
   44.1 Quotient Predicate . . . . . . . . . . . . . . . . . . . . . . 857
   44.2 lemmas for regularisation of ball and bex . . . . . . . . . 861
   44.3 Bounded abstraction . . . . . . . . . . . . . . . . . . . . . 863
   44.4 Bex1-rel quantifier . . . . . . . . . . . . . . . . . . . . . . 864
   44.5 Various respects and preserve lemmas . . . . . . . . . . . 865
   44.6 Quotient composition . . . . . . . . . . . . . . . . . . . . 868
   44.7 Quotient3 to Quotient . . . . . . . . . . . . . . . . . . . . 869
   44.8 ML setup . . . . . . . . . . . . . . . . . . . . . . . . . . . . 870
   44.9 Methods / Interface . . . . . . . . . . . . . . . . . . . . . 871

45 Lifting of BNFs 872

46 Binary Numerals 875
   46.1 The num type . . . . . . . . . . . . . . . . . . . . . . . . . 875
   46.2 Numeral operations . . . . . . . . . . . . . . . . . . . . . 877
   46.3 Binary numerals . . . . . . . . . . . . . . . . . . . . . . . . 880
   46.4 Class-specific numeral rules . . . . . . . . . . . . . . . . . 882
      46.4.1 Structures with addition: class numeral . . . . . . . . 882
      46.4.2 Structures with negation: class neg-numeral . . . . . . 882
      46.4.3 Structures with multiplication: class semiring-numeral 886
      46.4.4 Structures with a zero: class semiring-1 . . . . . . . . 886
      46.4.5 Equality: class semiring-char-0 . . . . . . . . . . . . 887
      46.4.6 Comparisons: class linordered-nonzero-semiring . . . 888
46.4.7 Multiplication and negation: class ring-I 890
46.4.8 Equality using iszero for rings with non-zero characteristic 890
46.4.9 Equality and negation: class ring-char-0 891
46.4.10 Structures with negation and order: class linordered-idom 893
46.4.11 Natural numbers 895
46.5 Particular lemmas concerning 2::'a 899
46.6 Numeral equations as default simplification rules 900
46.6.1 Special Simplification for Constants 900
46.6.2 Optional Simplification Rules Involving Constants 902
46.7 Setting up simprocs 902
46.7.1 Simplification of arithmetic operations on integer constants 903
46.7.2 Simplification of arithmetic when nested to the right 904
46.8 Code module namespace 905
46.9 Printing of evaluated natural numbers as numerals 905
46.10 More on auxiliary conversion 905

47 Exponentiation 906
47.1 Powers for Arbitrary Monoids 906
47.2 Exponentiation on ordered types 915
47.3 Miscellaneous rules 924
47.4 Exponentiation for the Natural Numbers 925
47.4.1 Cardinality of the Powerset 927
47.5 Code generator tweak 928

48 Big sum and product over finite (non-empty) sets 928
48.1 Generic monoid operation over a set 928
48.1.1 Standard sum or product indexed by a finite set 928
48.1.2 HOL Light variant: sum/product indexed by the non-neutral subset 939
48.2 Generalized summation over a set 941
48.2.1 Properties in more restricted classes of structures 942
48.2.2 Cardinality as special case of sum 951
48.2.3 Cardinality of products 956
48.3 Generalized product over a set 957
48.3.1 Properties in more restricted classes of structures 958

49 Chain-complete partial orders and their fixpoints 964
49.1 Chains 964
49.2 Chain-complete partial orders 965
49.3 Transfinite iteration of a function 965
49.4 Fixpoint combinator 967
49.5 Fixpoint induction 968
# Datatype option

50.0.1 Operations .......................... 973
50.1 Transfer rules for the Transfer package ........................................... 978
   50.1.1 Interaction with finite sets .................................................. 978
   50.1.2 Code generator setup ......................................................... 978

# Partial Function Definitions

51.1 Axiomatic setup ..................................................... 980
51.2 Flat interpretation: tailrec and option .................................... 984

# Reconstructing external resolution proofs for propositional logic

52 Reconstructing external resolution proofs for propositional logic 989

# Function Definitions and Termination Proofs

53 Function Definitions and Termination Proofs 990
   53.1 Definitions with default value .............................................. 990
   53.2 Measure functions ............................................................ 992
   53.3 Congruence rules .............................................................. 992
   53.4 Simp rules for termination proofs ....................................... 993
   53.5 Decomposition ............................................................... 993
   53.6 Reduction pairs ............................................................. 993
   53.7 Concrete orders for SCNP termination proofs .......................... 994
   53.8 Yet more induction principles on the natural numbers .............. 996
   53.9 Tool setup ................................................................. 996

# The Integers as Equivalence Classes over Pairs of Natural Numbers

54 The Integers as Equivalence Classes over Pairs of Natural Numbers 997
   54.1 Definition of integers as a quotient type .............................. 997
   54.2 Integers form a commutative ring ......................................... 997
   54.3 Integers are totally ordered ............................................... 998
   54.4 Ordering properties of arithmetic operations .......................... 999
   54.5 Embedding of the Integers into any ring-1: of-int ................. 1001
   54.6 Magnitude of an Integer, as a Natural Number: nat .............. 1007
   54.7 Lemmas about the Function of-nat and Orderings .................. 1011
   54.8 Cases and induction ....................................................... 1012
      54.8.1 Binary comparisons .................................................. 1014
      54.8.2 Comparisons, for Ordered Rings .................................. 1014
   54.9 The Set of Integers ....................................................... 1015
   54.10 sum and prod .............................................................. 1019
   54.11 Setting up simplification procedures ................................. 1019
   54.12 More Inequality Reasoning .................................................. 1020
   54.13 The functions nat and int .................................................. 1021
   54.14 Induction principles for int ............................................. 1023
   54.15 Intermediate value theorems .............................................. 1026
   54.16 Products and 1, by T. M. Rasmussen ................................. 1026
54.17 The divides relation .................................................. 1027
54.18 Powers with integer exponents ....................................... 1032
54.19 Finiteness of intervals ................................................ 1039
54.20 Configuration of the code generator ................................. 1040
54.21 Duplicates .............................................................. 1043

55 Big infimum (minimum) and supremum (maximum) over finite (non-empty) sets 1043
55.1 Generic lattice operations over a set .................................. 1043
  55.1.1 Without neutral element .......................................... 1043
  55.1.2 With neutral element .............................................. 1047
55.2 Lattice operations on finite sets ...................................... 1049
55.3 Infimum and Supremum over non-empty sets ......................... 1050
55.4 Minimum and Maximum over non-empty sets ......................... 1053
55.5 Arg Min ............................................................... 1061
55.6 Arg Max ............................................................... 1064

56 Division in euclidean (semi)rings 1065
56.1 Euclidean (semi)rings with explicit division and remainder .... 1065
56.2 Euclidean (semi)rings with cancel rules .............................. 1069
56.3 Uniquely determined division ......................................... 1078
56.4 Division on nat ........................................................ 1083
56.5 Division on int ........................................................ 1099
  56.5.1 Basic instantiation ................................................. 1099
  56.5.2 Algebraic foundations ............................................. 1100
  56.5.3 Basic conversions ................................................ 1102
  56.5.4 Euclidean division ................................................. 1103
  56.5.5 Trivial reduction steps .......................................... 1105
  56.5.6 More uniqueness rules .......................................... 1107
  56.5.7 Laws for unary minus .......................................... 1107
  56.5.8 Borders ........................................................... 1108
  56.5.9 Splitting Rules for div and mod ................................. 1109
  56.5.10 Algebraic rewrites .............................................. 1110
  56.5.11 Distributive laws for conversions ............................... 1112
  56.5.12 Monotonicity in the First Argument (Dividend) ............... 1112
  56.5.13 Monotonicity in the Second Argument (Divisor) ............... 1113
  56.5.14 Quotients of Signs ............................................. 1114
  56.5.15 Further properties ............................................. 1117
  56.5.16 Computing div and mod by shifting ............................ 1118
56.6 Code generation ...................................................... 1121
57 Parity in rings and semirings

57.1 Ring structures with parity and even/odd predicates

57.2 Instance for nat

57.3 Parity and powers

57.4 Instance for int

57.5 Special case: euclidean rings structurally containing the natural numbers

57.6 Generic symbolic computations

57.6.1 Computation by simplification

57.7 Computing congruences modulo \(2^q\)

58 Combination and Cancellation Simprocs for Numeral Expressions

59 Semiring normalization

60 Groebner bases

60.1 Groebner Bases

61 Set intervals

61.1 Various equivalences

61.2 Logical Equivalences for Set Inclusion and Equality

61.3 Two-sided intervals

61.3.1 Emptiness, singletons, subset

61.4 Infinite intervals

61.4.1 Intersection

61.5 Intervals of natural numbers

61.5.1 The Constant lessThan

61.5.2 The Constant greaterThan

61.5.3 The Constant atLeast

61.5.4 The Constant atMost

61.5.5 The Constant atLeastLessThan

61.5.6 The Constant atLeastAtMost

61.5.7 Intervals of nats with Suc

61.5.8 Intervals and numerals

61.5.9 Image

61.5.10 Finiteness

61.5.11 Proving Inclusions and Equalities between Unions

61.5.12 Cardinality

61.6 Intervals of integers

61.6.1 Finiteness

61.6.2 Cardinality

61.7 Lemmas useful with the summation operator sum

61.7.1 Disjoint Unions
61.7.2 Disjoint Intersections ........................................ 1197
61.7.3 Some Differences ........................................... 1197
61.7.4 Some Subset Conditions ................................. 1198
61.8 Generic big monoid operation over intervals ............. 1198
61.9 Summation indexed over intervals ......................... 1201
  61.9.1 Shifting bounds ........................................ 1207
  61.9.2 Telescoping sums ..................................... 1208
  61.9.3 The formula for geometric sums ....................... 1208
  61.9.4 Geometric progressions ............................... 1211
  61.9.5 The formulae for arithmetic sums ..................... 1212
  61.9.6 Division remainder .................................... 1214
61.10 Products indexed over intervals .......................... 1214
  61.10.1 Telescoping products .................................. 1215
61.11 Efficient folding over intervals ........................... 1216

62 Decision Procedure for Presburger Arithmetic .......... 1218
  62.1 The $-\infty$ and $+\infty$ Properties ....................... 1218
  62.2 The A and B sets ......................................... 1220
  62.3 Cooper’s Theorem $-\infty$ and $+\infty$ Version ........ 1224
    62.3.1 First some trivial facts about periodic sets or predicates 1224
    62.3.2 The $-\infty$ Version ................................ 1224
    62.3.3 The $+\infty$ Version ................................ 1226
  62.4 Nice facts about division by $4\div'\!a$ ............... 1230
  62.5 Try0 .................................................... 1230

63 Bindings to Satisfiability Modulo Theories (SMT) solvers
  based on SMT-LIB 2 ............................................ 1230
  63.1 A skolemization tactic and proof method .............. 1230
  63.2 Triggers for quantifier instantiation ................. 1231
  63.3 Higher-order encoding .................................. 1231
  63.4 Normalization ............................................ 1232
  63.5 Integer division and modulo for Z3 .................... 1233
  63.6 Extra theorems for veriT reconstruction .............. 1233
  63.7 Setup .................................................... 1243
  63.8 Configuration ............................................ 1243
  63.9 General configuration options ...................... 1243
  63.10 Certificates ........................................... 1244
  63.11 Tracing ................................................ 1245
  63.12 Schematic rules for Z3 proof reconstruction .......... 1245

64 Sledgehammer: Isabelle–ATP Linkup ....................... 1248
65 Setup for Lifting/Transfer for the set type

65.1 Relator and predicator properties ........................................ 1248
65.2 Quotient theorem for the Lifting package .............................. 1250
65.3 Transfer rules for the Transfer package ............................... 1251
   65.3.1 Unconditional transfer rules ....................................... 1251
   65.3.2 Rules requiring bi-unique, bi-total or right-total rela-
   tions .............................................................. 1252

66 The datatype of finite lists .................................................. 1256

66.1 Basic list processing functions .......................................... 1257
   66.1.1 List comprehension ................................................ 1264
   66.1.2 [] and (\#) ...................................................... 1272
   66.1.3 length .................................................................. 1273
   66.1.4 @ – append ................................................................ 1275
   66.1.5 map ..................................................................... 1278
   66.1.6 rev ...................................................................... 1280
   66.1.7 set ...................................................................... 1282
   66.1.8 concat ................................................................... 1285
   66.1.9 filter ..................................................................... 1287
   66.1.10 List partitioning ....................................................... 1290
   66.1.11 (!) ..................................................................... 1291
   66.1.12 list-update ............................................................. 1294
   66.1.13 last and butlast ......................................................... 1296
   66.1.14 take and drop ........................................................... 1298
   66.1.15 takeWhile and dropWhile .......................................... 1305
   66.1.16 zip ..................................................................... 1309
   66.1.17 list-all2 ................................................................. 1315
   66.1.18 List.product and product-lists .................................... 1318
   66.1.19 fold with natural argument order .................................. 1319
   66.1.20 Fold variants: foldr and foldl ..................................... 1322
   66.1.21 upt .................................................................... 1323
   66.1.22 upto: interval-list on int .......................................... 1326
   66.1.23 successively ............................................................. 1328
   66.1.24 distinct and remdups and remdups-adj ......................... 1329

66.2 distinct-adj ...................................................................... 1343
   66.2.1 insert ..................................................................... 1344
   66.2.2 List.union ............................................................... 1344
   66.2.3 find ..................................................................... 1345
   66.2.4 count-list ............................................................... 1345
   66.2.5 List.extract ............................................................. 1346
   66.2.6 removeI ................................................................. 1347
   66.2.7 removeAll ............................................................... 1348
   66.2.8 replicate ................................................................. 1349
   66.2.9 enumerate ............................................................... 1353
66.2.10 rotate1 and rotate .......................... 1354
66.2.11 nths — a generalization of (!) to sets .......... 1358
66.2.12 subseqs and List.n-lists .......................... 1360
66.2.13 splice ............................................. 1361
66.2.14 shuffles ............................................. 1361
66.2.15 Transpose ............................................. 1364
66.2.16 min and arg-min ................................. 1366
66.2.17 (In)finiteness ....................................... 1367
66.3 Sorting .................................................. 1370
  66.3.1 sorted-wrt ........................................ 1370
  66.3.2 sorted ............................................. 1372
  66.3.3 Sorting functions .................................. 1376
  66.3.4 transpose on sorted lists .......................... 1381
  66.3.5 sorted-key-list-of-set ............................. 1384
  66.3.6 lists: the list-forming operator over sets ...... 1389
  66.3.7 Inductive definition for membership ............. 1391
  66.3.8 Lists as Cartesian products ........................ 1391
66.4 Relations on Lists .................................... 1392
  66.4.1 Length Lexicographic Ordering ..................... 1392
  66.4.2 Lexicographic Ordering ............................. 1396
  66.4.3 Lexicographic combination of measure functions .......... 1405
  66.4.4 Lifting Relations to Lists: one element ........ 1405
  66.4.5 Lifting Relations to Lists: all elements .......... 1408
66.5 Size function ........................................... 1411
66.6 Monad operation ....................................... 1412
66.7 Code generation ......................................... 1412
  66.7.1 Counterparts for set-related operations .......... 1413
  66.7.2 Optimizing by rewriting ........................... 1417

   plugin {quickcheck-full-exhaustive},
   plugin {quickcheck-narrowing}]
)

2.1 Primitive logic

The definition of the logic is based on Mike Gordon’s technical report [2] that describes the first implementation of HOL. However, there are a number of differences. In particular, we start with the definite description operator and introduce Hilbert’s ε operator only much later. Moreover, axiom $(P → Q) → (Q → P) → (P = Q)$ is derived from the other axioms. The fact that this axiom is derivable was first noticed by Bruno Barras (for Mike Gordon’s line of HOL systems) and later independently by Alexander Maletzky (for Isabelle/HOL).

2.1.1 Core syntax

setup Axclass.class-axiomatization (binding {type}, []);
default-sort type
setup Object-Logic.add-base-sort sort {type}"

setup Proofterm.set-preproc (Proof-Rewrite-Rules.standard-preproc []))

axiomatization where fun-arity: OFCLASS(‘a ⇒ ‘b, type-class)
instance fun :: (type, type) type by (rule fun-arity)

axiomatization where itself-arity: OFCLASS(‘a itself, type-class)
instance itself :: (type) type by (rule itself-arity)

typedcl bool

judgment Trueprop :: bool ⇒ prop ((-) 5)

axiomatization implies :: [bool, bool] ⇒ bool (infixr → 25)
  and eq :: ['a, 'a] ⇒ bool
  and The :: ('a ⇒ bool) ⇒ 'a

notation (input)
\( \text{eq (infixl} = 50) \)
\( \text{notation (output)} \)
\( \text{eq (infix} = 50) \)

The input syntax for eq is more permissive than the output syntax because of the large amount of material that relies on infixl.

2.1.2 Defined connectives and quantifiers

definition True :: bool
  where True \( \equiv (\lambda x::\text{bool}. \; x) = (\lambda x. \; x)) \)

definition All :: (\( 'a \Rightarrow \text{bool} \)) \Rightarrow \text{bool} \; (\text{binder} \; \forall \; 10)
  where All P \( \equiv (\forall Q. \; (\forall x. \; P x \; \rightarrow Q) \; \rightarrow Q) \)

definition Ex :: (\( 'a \Rightarrow \text{bool} \)) \Rightarrow \text{bool} \; (\text{binder} \; \exists \; 10)
  where Ex P \( \equiv \forall Q. \; (\forall x. \; P x \; \rightarrow Q) \; \rightarrow Q \)

definition False :: bool
  where False \( \equiv (\forall P. \; P) \)

definition Not :: bool \Rightarrow bool \; (\neg - [40] 40)
  where not-def: \( \neg P \; \equiv P \; \rightarrow \text{False} \)

definition conj :: [\text{bool}, \text{bool}] \Rightarrow bool \; (\text{infixr} \; \land 35)
  where and-def: \( \land P \; \equiv (\forall R. \; (P \; \rightarrow Q) \; \rightarrow R) \)

definition disj :: [\text{bool}, \text{bool}] \Rightarrow bool \; (\text{infixr} \; \lor 30)
  where or-def: \( \lor P \; \equiv (\forall R. \; (P \; \rightarrow R) \; \rightarrow (Q \; \rightarrow R)) \)

definition Uniq :: (\( 'a \Rightarrow \text{bool} \)) \Rightarrow \text{bool}
  where Uniq P \( \equiv (\forall x \; y. \; P x \; \rightarrow P y \; \rightarrow y = x) \)

definition Ex1 :: (\( 'a \Rightarrow \text{bool} \)) \Rightarrow \text{bool}
  where Ex1 P \( \equiv (\exists x. \; P x \; \land (\forall y. \; P y \; \rightarrow y = x) \)

2.1.3 Additional concrete syntax

syntax (ASCII) -Uniq :: pttrn \Rightarrow bool \Rightarrow bool \; ((4? < -/-) [0, 10] 10)
syntax -Uniq :: pttrn \Rightarrow bool \Rightarrow bool \; ((23 \leq 1 -/-) [0, 10] 10)

  Ex (binder ? 10)

2.1.4 Axioms and basic definitions

axiomatization where
  refl: t = (t::'a) and
  subst: s = t ⇒ P s ⇒ P t and
  ext: (∀x:'a. f x ::'b = g x) ⇒ (λx. f x) = (λx. g x)
  — Extensionality is built into the meta-logic, and this rule expresses a related
  property. It is an eta-expanded version of the traditional rule, and similar to the
  ABS rule of HOL and

    the-eq-trivial: (THE x. x = a) = (a::'a)

axiomatization where
  impI: (P ⇒ Q) ⇒ P ⇒ Q and
  mp: [P ⇒ Q; P] ⇒ Q and

  True-or-False: (P = True) ∨ (P = False)

definition If :: bool ⇒ 'a ⇒ 'a ⇒ 'a (((if (-)/ then (-)/ else (-)) [0, 0, 10] 10)
  where If P x y ≡ (THE z::'a. (P = True ⇒ z = x) ∧ (P = False ⇒ z = y))

definition Let :: 'a ⇒ ('a ⇒ 'b) ⇒ 'b
  where Let s f ≡ f s

translations
  - Let (-binds b bs) e ≡ - Let b (- Let bs e)
  let x = a in e ≡ CONST Let a (λx. e)

axiomatization undefined :: 'a

class default = fixes default :: 'a
2.2 Fundamental rules

2.2.1 Equality

lemma sym: \( s = t \implies t = s \)
by (erule subst) (rule refl)

lemma ssubst: \( t = s \implies P s \implies P t \)
by (erule sym) (erule subst)

lemma trans: \[ r = s; s = t \] \( \implies r = t \)
by (erule subst)

lemma trans-sym [Pure.elim?]: \( r = s \implies t = s \implies r = t \)
by (rule trans [OF - sym])

lemma meta-eq-to-obj-eq:
assumes \( A \equiv B \)
shows \( A = B \)
unfolding assms by (rule refl)

Useful with erule for proving equalities from known equalities.

lemma box-equals: \[ [a = b; a = c; b = d] \implies c = d \]
by (iprover intro: sym trans)

For calculational reasoning:

lemma forw-subst: \( a = b \implies P b \implies P a \)
by (rule ssubst)

lemma back-subst: \( P a \implies a = b \implies P b \)
by (rule subst)

2.2.2 Congruence rules for application

Similar to AP-THM in Gordon’s HOL.

lemma fun-cong: \( (f :: 'a \Rightarrow 'b) = g \Rightarrow f x = g x \)
by (iprover intro: refl elim: subst)

Similar to AP-TERM in Gordon’s HOL and FOL’s subst-context.

lemma arg-cong: \( x = y \Rightarrow f x = f y \)
by (iprover intro: refl elim: subst)

lemma arg-cong2: \[ [a = b; c = d] \Rightarrow f a c = f b d \]
by (iprover intro: refl elim: subst)

lemma cong: \( f = g; (x:'a) = y \) \( \Rightarrow f x = g y \)
by (iprover intro: refl elim: subst)

ML \{fun cong_tac ctxt = Cong-Tac.cong_tac ctxt @{thm cong}\}
2.2.3 Equality of booleans – iff

**lemma iffD2**: \[P = Q; Q\] \(\Rightarrow\) \(P\)

by (erule ssubst)

**lemma rev-iffD2**: \[Q; P = Q\] \(\Rightarrow\) \(P\)

by (erule iffD2)

**lemma iffD1**: \(Q = P \Rightarrow Q \Rightarrow P\)

by (drule sym) (rule iffD2)

**lemma rev-iffD1**: \(Q \Rightarrow Q = P \Rightarrow P\)

by (drule sym) (rule rev-iffD2)

**lemma iffE**:  
assumes major: \(P = Q\)  
and minor: \([P \rightarrow Q; Q \rightarrow P] \Rightarrow R\)

shows \(R\)

by (iprover intro: minor impI major \[THEN\] iffD2 \[THEN\] iffD1)

2.2.4 True (1)

**lemma TrueI**: \(True\)

unfolding True-def by (rule refl)

**lemma eqTrueE**: \(P = True \Rightarrow P\)

by (erule iffD2) (rule TrueI)

2.2.5 Universal quantifier (1)

**lemma spec**: \(\forall x::'a. P x \Rightarrow P x\)

unfolding All-def by (iprover intro: eqTrueE fun-cong)

**lemma allE**:  
assumes major: \(\forall x. P x\) and minor: \(P x \Rightarrow R\)

shows \(R\)

by (iprover intro: minor major \[THEN\] spec)

**lemma all-dupE**:  
assumes major: \(\forall x. P x\) and minor: \([P x; \forall x. P x] \Rightarrow R\)

shows \(R\)

by (iprover intro: minor major major \[THEN\] spec)

2.2.6 False

Depends upon spec; it is impossible to do propositional logic before quantifiers!

**lemma FalseE**: \(False \Rightarrow P\)

unfolding False-def by (erule spec)
lemma False-neq-True: False = True ⇒ P
by (erule eqTrueE [THEN FalseE])

2.2.7 Negation

lemma notI:
  assumes P ⇒ False
  shows ¬ P
  unfolding not-def by (iprover intro: impI assms)

lemma False-not-True: False ≠ True
by (iprover intro: notI elim: False-neq-True)

lemma True-not-False: True ≠ False
by (iprover intro: notI dest: sym elim: False-neq-True)

lemma notE: [¬ P; P] ⇒ R
unfolding not-def
by (iprover intro: mp [THEN FalseE])

2.2.8 Implication

lemma impE:
  assumes P ⇒ Q Q ⇒ R
  shows R
  by (iprover intro: assms mp)

Reduces Q to P ⇒ Q, allowing substitution in P.

lemma rev-mp: [P; P ⇒ Q] ⇒ Q
by (rule mp)

lemma contrapos-nn:
  assumes major: ¬ Q
  and minor: P ⇒ Q
  shows ¬ P
  by (iprover intro: notI minor major [THEN notE])

Not used at all, but we already have the other 3 combinations.

lemma contrapos-pn:
  assumes major: Q
  and minor: P ⇒ ¬ Q
  shows ¬ P
  by (iprover intro: notI minor major notE)

lemma not-sym: t ≠ s ⇒ s ≠ t
by (erule contrapos-nn) (erule sym)

lemma eq-neq-eq-imp-neq: [x = a; a ≠ b; b = y] ⇒ x ≠ y
by (erule subst, erule ss subst, assumption)
The theory "HOL"

2.2.9 Disjunction (1)

Lemma `disjE`:

- Assumes `major: P ∨ Q`
- and `minorP: P ⇒ R`
- and `minorQ: Q ⇒ R`
- Shows `R`

by `(iprover intro: minorP minorQ impI`
  `major [unfolded or-def, THEN spec, THEN mp, THEN mp])`

2.2.10 Derivation of `iffI`

In an intuitionistic version of HOL `iffI` needs to be an axiom.

Lemma `iffI`:

- Assumes `P =⇒ Q` and `Q =⇒ P`
- Shows `P = Q`

Proof (rule `disjE` [OF `True-or-False` [of `P`]])

Assume `1: P = True`

Note `Q = assms(1)` [OF `eqTrueE` [OF `this`]]

From `1` show `?thesis`

Proof (rule `ssubst`)

From `True-or-False` [of `Q`] show `True = Q`

Proof (rule `disjE`)

Assume `Q = True`

Thus `?thesis` by (rule `sym`)

Next

Assume `Q = False`

With `Q` have `False` by (rule `rev-iffD1`)

Thus `?thesis` by (rule `FalseE`)

Qed

Qed

Next

Assume `2: P = False`

Thus `?thesis`

Proof (rule `ssubst`)

From `True-or-False` [of `Q`] show `False = Q`

Proof (rule `disjE`)

Assume `Q = True`

From `2 assms(2)` [OF `eqTrueE` [OF `this`]] have `False` by (rule `iffD1`)

Thus `?thesis` by (rule `FalseE`)

Next

Assume `Q = False`

Thus `?thesis` by (rule `sym`)

Qed

Qed

2.2.11 True (2)

Lemma `eqTrueI`: `P =⇒ P = True`
2.2.12 Universal quantifier (2)

lemma allI:
  assumes $\forall x::'a. P\ x$
  shows $\forall x. P\ x$
  unfolding All-def by (iprover intro: ext eqTrueI assms)

2.2.13 Existential quantifier

lemma exI: $P\ x \Rightarrow \exists x::'a. P\ x$
  unfolding Ex-def by (iprover intro: allI allE impI mp)

lemma exE:
  assumes major: $\exists x::'a. P\ x$
    and minor: $\forall x. P\ x \Rightarrow Q$
  shows Q
  by (rule major [unfolded Ex-def, THEN spec, THEN mp]) (iprover intro: impI [THEN allI] minor)

2.2.14 Conjunction

lemma conjI: $[P; Q] \Rightarrow P \land Q$
  unfolding and-def by (iprover intro: impl [THEN allI] mp)

lemma conjunct1: $[P \land Q] \Rightarrow P$
  unfolding and-def by (iprover intro: impl dest: spec mp)

lemma conjunct2: $[P \land Q] \Rightarrow Q$
  unfolding and-def by (iprover intro: impl dest: spec mp)

lemma conjE:
  assumes major: $P \land Q$
    and minor: $[P; Q] \Rightarrow R$
  shows R
  proof (rule minor)
    show P by (rule major [THEN conjunct1])
    show Q by (rule major [THEN conjunct2])
  qed

lemma context-conjI:
  assumes P P $\Rightarrow Q$
  shows $P \land Q$
  by (iprover intro: conjI assms)

2.2.15 Disjunction (2)

lemma disjI1: $P \Rightarrow P \lor Q$
  unfolding or-def by (iprover intro: allI impI mp)
lemma \( \text{disjI2} \): \( Q \implies P \lor Q \)
unfolding \( \text{or-def} \) by (\text{iprover intro: allI impI mp})

2.2.16 Classical logic

lemma \( \text{classical} \):
 assumes \( \neg P \implies P \)
 shows \( P \)
proof (rule \text{True-or-False [THEN disjE]})
 show \( P \) if \( P = \text{True} \)
 using that by (\text{iprover intro: eqTrueE})
 show \( P \) if \( P = \text{False} \)
proof (intro notI assms)
 assume \( P \)
 with that show \( \text{False} \)
 by (\text{iprover elim: subst})
qed
qed

lemmas \( \text{ccontr} = \text{FalseE [THEN classical]} \)

notE with premises exchanged; it discharges \( \neg R \) so that it can be used to make elimination rules.

lemma \( \text{rev-notE} \):
 assumes \( \text{premp: } P \)
 and \( \text{premnot: } \neg R \implies \neg P \)
 shows \( R \)
 by (\text{iprover intro: ccontr notE [OF premnot premp]})

Double negation law.

lemma \( \text{notnotD} \): \( \neg P \implies P \)
 by (\text{iprover intro: ccontr notE })

lemma \( \text{contrapos-pp} \):
 assumes \( \text{p1: } Q \)
 and \( \text{p2: } \neg P \implies \neg Q \)
 shows \( P \)
 by (\text{iprover intro: classical p1 p2 notE})

2.2.17 Unique existence

lemma \( \text{Uniq-I [intro?]} \):
 assumes \( x y. [P x; P y] \implies y = x \)
 shows \( \text{Uniq } P \)
unfolding \( \text{Uniq-def} \) by (\text{iprover intro: assms allI impI})

lemma \( \text{Uniq-D [dest?]} \): \( [\text{Uniq } P; P a; P b] \implies a = b \)
unfolding \( \text{Uniq-def} \) by (\text{iprover dest: spec mp})
lemma ex1I:
  assumes P a \land x. P x \implies x = a
  shows \exists !x. P x
  unfolding Ex1-def by (iprover intro: assms exI conjI allI impI)

Sometimes easier to use: the premises have no shared variables. Safe!

lemma ex-ex1I:
  assumes ex-prem: \exists x. P x
  and eq: \land x y. [P x; P y] \implies x = y
  shows \exists !x. P x
  by (iprover intro: ex-prem [THEN exE] ex1I eq)

lemma ex1E:
  assumes major: \exists !x. P x and minor: \land x. [P x; \forall y. P y \implies y = x] \implies R
  shows R
  proof (rule major [unfolded Ex1-def, THEN exE])
    show \land x. P x \land (\forall y. P y \implies y = x) \implies R
      by (iprover intro: minor elim: conjE)
  qed

lemma ex1-implies-ex: \exists !x. P x \implies \exists !x. P x
  by (iprover intro: exI elim: ex1E)

2.2.18 Classical intro rules for disjunction and existential quantifiers

lemma disjCI:
  assumes \neg Q \implies P
  shows P \lor Q
  by (rule classical) (iprover intro: assms disjI1 disjI2 notI elim: notE)

lemma excluded-middle: \neg P \lor P
  by (iprover intro: disjCI)

Case distinction as a natural deduction rule. Note that \neg P is the second
  case, not the first.

lemma case-split [case-names True False]:
  assumes P \implies Q \land P \implies Q
  shows Q
  using excluded-middle [of P]
    by (iprover intro: assms elim: disjE)

Classical implies (\implies) elimination.

lemma impCE:
  assumes major: P \implies Q
  and minor: \neg P \implies R Q \implies R
  shows R
  using excluded-middle [of P]
This version of \( \rightarrow \) elimination works on \( Q \) before \( P \). It works best for those cases in which \( P \) holds "almost everywhere". Can’t install as default: would break old proofs.

**lemma** \( \text{impCE}' \):
- **assumes** major: \( P \rightarrow Q \)
- and minor: \( Q \Rightarrow R \land P \Rightarrow R \)
- **shows** \( R \)
- **using** assms by (elim \( \text{impCE} \))

Classical \( \iff \rightarrow \) elimination.

**lemma** \( \text{iffCE} \):

lemmas [cong] = imp-cong simp-implies-cong
lemmas [split] = if-split
Simplifies $x$ assuming $c$ and $y$ assuming $\neg c$.

**lemma if-cong:**
- **assumes** $b = c$
- and $c \Rightarrow x = u$
- and $\neg c \Rightarrow y = v$
- **shows** $(\text{if } b \text{ then } x \text{ else } y) = (\text{if } c \text{ then } u \text{ else } v)$
- **using** `assms by simp`

Prevents simplification of $x$ and $y$: faster and allows the execution of functional programs.

**lemma if-weak-cong [cong]:**
- **assumes** $b = c$
- **shows** $(\text{if } b \text{ then } x \text{ else } y) = (\text{if } c \text{ then } x \text{ else } y)$
- **using** `assms by (rule arg-cong)`

Prevents simplification of $t$: much faster

**lemma let-weak-cong:**
- **assumes** $a = b$
- **shows** $(\text{let } x = a \text{ in } t x) = (\text{let } x = b \text{ in } t x)$
- **using** `assms by (rule arg-cong)`

To tidy up the result of a simproc. Only the RHS will be simplified.

**lemma eq-cong2:**
- **assumes** $u = u'$
- **shows** $(t \equiv u) \equiv (t \equiv u')$
- **using** `assms by simp`

**lemma if-distrib:** $f \ (\text{if } c \text{ then } x \text{ else } y) = (\text{if } c \text{ then } f x \text{ else } f y)$
- **by** `simp`

**lemma if-distribR:** $(\text{if } b \text{ then } f \text{ else } g) \ x = (\text{if } b \text{ then } f \text{ else } g \ x)$
- **by** `simp`

**lemma all-if-distrib:** $(\forall x. \text{if } x = a \text{ then } P x \text{ else } Q x) \iff P a \land (\forall x. \ x \neq a \rightarrow Q x)$
- **by** `auto`

**lemma ex-if-distrib:** $(\exists x. \text{if } x = a \text{ then } P x \text{ else } Q x) \iff P a \lor (\exists x. \ x \neq a \land Q x)$
- **by** `auto`

**lemma if-if-eq-conj:** $(\text{if } P \text{ then } P \text{ if } Q \text{ then } x \text{ else } y \text{ else } y) = (\text{if } P \land Q \text{ then } x \text{ else } y)$
- **by** `simp`

As a simplification rule, it replaces all function equalities by first-order equalities.

3 No-Match simproc

The simplification procedure can be used to avoid simplification of terms of a certain form.
definition NO-MATCH :: 'a ⇒ 'b ⇒ bool
  where NO-MATCH pat val ≡ True

lemma NO-MATCH-cong[cong]: NO-MATCH pat val = NO-MATCH pat val
  by (rule refl)

declare [[coercion-args NO-MATCH −−]]

simproc-setup NO-MATCH (NO-MATCH pat val) = K (fn ctxt => fn ct =>
  let
    val thy = Proof-Context.theory-of ctxt
    val dest-binop = Term.dest-comb #> apfst (Term.dest-comb #> snd)
    val m = Pattern.matches thy (dest-binop (Thm.term-of ct))
  in if m then NONE else SOME @{thm NO-MATCH-def} end)

This setup ensures that a rewrite rule of the form NO-MATCH pat val ⇒ t is only applied, if the pattern pat does not match the value val.

Tagging a premise of a simp rule with ASSUMPTION forces the simplifier not to simplify the argument and to solve it by an assumption.

definition ASSUMPTION :: bool ⇒ bool
  where ASSUMPTION A ≡ A

    end

val order = Outer-Syntax.command (command-keyword (Scan.succeed (fn ctxt => SIMPLE-METHOD' (HOL-Order-Tac.tac [] ctxt))))

The method order allows one to use the order tactic located in Provers/order_tac.ML in a standalone fashion.

The tactic rearranges the goal to prove False, then retrieves order literals of partial and linear orders (i.e. \( x = y \), \( x \leq y \), \( x < y \), and their negated versions) from the premises and finally tries to derive a contradiction. Its
main use case is as a solver to simp (see below), where it e.g. solves premises of conditional rewrite rules.

The tactic has two configuration attributes that control its behaviour:

- **order-trace** toggles tracing for the solver.
- **order-split-limit** limits the number of order literals of the form \( \neg x < y \) that are passed to the tactic. This is helpful since these literals lead to case splitting and thus exponential runtime. This only applies to partial orders.

We setup the solver for HOL with the structure **HOL_Order_Tac** here but the prover is agnostic to the object logic. It is possible to register orders with the prover using the functions **HOL_Order_Tac.declare_order** and **HOL_Order_Tac.declare_linorder**, which we do below for the type classes **order** and **linorder**. If possible, one should instantiate these type classes instead of registering new orders with the solver. One can also interpret the type class locales **order** and **linorder**. An example can be seen in **Library/Sublist.thy**, which contains e.g. the prefix order on lists.

The diagnostic command **print-orders** shows all orders known to the tactic in the current context.

5 Groups, also combined with orderings

theory Groups
  imports Orderings
begin

5.1 Dynamic facts

named-theorems ac-simps associativity and commutativity simplification rules
and algebra-simps algebra simplification rules for rings
and algebra-split-simps algebra simplification rules for rings, with potential goal splitting
and field-simps algebra simplification rules for fields
and field-split-simps algebra simplification rules for fields, with potential goal splitting

The rewrites accumulated in algebra-simps deal with the classical algebraic structures of groups, rings and family. They simplify terms by multiplying everything out (in case of a ring) and bringing sums and products into a canonical form (by ordered rewriting). As a result it decides group and ring equalities but also helps with inequalities.

Of course it also works for fields, but it knows nothing about multiplicative inverses or division. This is catered for by field-simps.

Facts in field-simps multiply with denominators in (in)equations if they can be proved to be non-zero (for equations) or positive/negative (for inequalities). Can be too aggressive and is therefore separate from the more benign algebra-simps.

Collections algebra-split-simps and field-split-simps correspond to algebra-simps and field-simps but contain more aggressive rules that may lead to goal splitting.

5.2 Abstract structures

These locales provide basic structures for interpretation into bigger structures; extensions require careful thinking, otherwise undesired effects may occur due to interpretation.

prod.split could be declared as [split] done after the Splitter has been speeded up significantly; precompute the constants involved and don’t do anything unless the current goal contains one of those constants.

14.3.2 Tuple syntax

Patterns – extends pre-defined type pttrn used in abstractions.

nonterminal tuple-args and patterns
syntax
- tuple :: 'a ⇒ tuple-args ⇒ 'a × 'b
- tuple-arg :: 'a ⇒ tuple-args
- tuple-args :: 'a ⇒ tuple-args ⇒ tuple-args
- pattern :: pttrn ⇒ patterns ⇒ pttrn
- patterns :: pttrn ⇒ patterns ⇒ patterns
- unit :: pttrn

translations
(x, y) ⇔ CONST Pair x y
- pattern x y ⇔ CONST Pair x y
- patterns x y ⇔ CONST Pair x y
- tuple x y z ⇔ -tuple x (-tuple-arg (-tuple y z))
λ(x, y, zs). b ⇔ CONST case-prod (λx y. b)
- abs (CONST Pair x y) t ⇒ λx y. t
- abs (CONST Unity) t ⇒ λ(). t

print case-prod f as case-prod f and case-prod f as case-prod f
Reconstruct pattern from (nested) case-prods, avoiding eta-contraction of body; required for enclosing "let", if "let" does not avoid eta-contraction, which has been observed to occur.

print-translation : 
  let 
    fun case-prod-tr\' [Abs (x, T, t as (Abs abs))] = 
      (* case-prod (\x y. t) \Rightarrow \lambda(x, y) t *)

begin

Class normalization-semidom cultivates the idea that each integral domain can be split into equivalence classes whose representants are associated, i.e. divide each other. normalize specifies a canonical representant for each equivalence class. The rationale behind this is that it is easier to reason about equality than equivalences, hence we prefer to think about equality of normalized values rather than associated elements.

The method of infinite descent, frequently used in number theory. Provided by Roelof Oosterhuis. P n is true for all natural numbers if

- case “0”: given n = 0 prove P n
- case “smaller”: given n > 0 and ¬ P n prove there exists a smaller natural number m such that ¬ P m.

**lemma** infinite-descent: (∀ n. ¬ P n → ∃ m<n. ¬ P m) → P n for P :: nat ⇒ bool

— compact version without explicit base case

*by (induct n rule: less-induct) auto*

**lemma** infinite-descent0 (case-names 0 smaller):

fixes P :: nat ⇒ bool

assumes 1: ∀ x. V x = 0 ⇒ P x

and 2: ∀ x. V x > 0 ⇒ ¬ P x ⇒ ∃ y. V y < V x ∧ ¬ P y

shows P x

*proof* (rule infinite-descent)

fix n

show ¬ P n ⇒ ∃ m<n. ¬ P m

*using* assms by (cases n > 0) auto

qed

Infinite descent using a mapping to nat: P x is true for all x ∈ D if there exists a V ∈ D ⇒ nat and

- case “0”: given V x = 0 prove P x
- “smaller”: given V x > 0 and ¬ P x prove there exists a y ∈ D such that V y < V x and ¬ P y.

**corollary** infinite-descent0-measure (case-names 0 smaller):

fixes V :: 'a ⇒ nat

assumes 1: ∀ x. V x = 0 ⇒ P x

and 2: ∀ x. V x > 0 ⇒ ¬ P x ⇒ ∃ y. V y < V x ∧ ¬ P y

shows P x

*proof* –

*obtain n where* n = V x by auto

*moreover have* ∃ x. V x = n ⇒ P x

*proof* (induct n rule: infinite-descent0)

20.5 A basic fold functional for finite sets

The intended behaviour is fold f z {x₁, ..., xₙ} = f x₁ (... (f xₙ z)...) if f
is “left-commutative”. The commutativity requirement is relativised to the
carrier set S:

locale comp-fun-commute-on =
  fixes S :: 'a set
  fixes f :: 'a ⇒ 'b ⇒ 'b
  assumes comp-fun-commute-on: x ∈ S ⟹ y ∈ S ⟹ f y ∘ f x = f x ∘ f y
begin

lemma `fun-left-comm`: x ∈ S ⟹ y ∈ S ⟹ f y (f x z) = f x (f y z)
  using comp-fun-commute-on by (simp add: fun-eq-iff)
THEORY "Finite-Set"

lemma commute-left-comp: \( x \in S \Rightarrow y \in S \Rightarrow f y \circ (f x \circ g) = f x \circ (f y \circ g) \) by (simp add: o-assoc comp-fun-commute-on)

end

inductive fold-graph :: ('a ⇒ 'b ⇒ 'b) ⇒ 'b ⇒ 'a set ⇒ 'b ⇒ bool
  for \( f :: 'a ⇒ 'b ⇒ 'b \) and \( z :: 'b \)
  where
    emptyI [intro]: fold-graph f z \{\} z
  | insertI [intro]: \( x / \notin A \Rightarrow \) fold-graph f z A y ⇒ fold-graph f z (insert x A) (f x y)

inductive-cases empty-fold-graphE [elim!]: fold-graph f z \{\} x

lemma fold-graph-closed-lemma:
  fold-graph f z A x ∧ x ∈ B
  if fold-graph g z A x
  then \( \forall a b. a \in A \Rightarrow b \in B \Rightarrow f a b = g a b \)
  \( \forall a b. a \in A \Rightarrow b \in B \Rightarrow g a b \in B \)
  z ∈ B
  using that (1-3)

proof (induction rule: fold-graph.induct)
  case (insertI x A y)
  have fold-graph f z A y y ∈ B
    unfolding atomize-conj
    by (rule insertI.1H) (auto intro: insertI.prems)
  then have g x y ∈ B and f-eq: \( f x y = g x y \)
    by (auto simp: insertI.prems)
  moreover have fold-graph f z (insert x A) (f x y)
    by (rule fold-graph.insertI; fact)
  ultimately
  show \(?case \)
    by (simp add: f-eq)
qed (auto intro!; that)

lemma fold-graph-closed-eq:
  fold-graph f z A = fold-graph g z A
  if \( \forall a b. a \in A \Rightarrow b \in B \Rightarrow f a b = g a b \)
  \( \forall a b. a \in A \Rightarrow b \in B \Rightarrow g a b \in B \)
  z ∈ B
  using fold-graph-closed-lemma[of f z A - B g] fold-graph-closed-lemma[of g z A - B f] that
  by auto

definition fold :: ('a ⇒ 'b ⇒ 'b) ⇒ 'b ⇒ 'a set ⇒ 'b
  where fold f z A = (if finite A then (THE y. fold-graph f z A y) else z)

lemma fold-closed-eq: fold f z A = fold g z A
if $\forall a \in A \Rightarrow b \in B \Rightarrow f a b = g a b$
$\forall a \in A \Rightarrow b \in B \Rightarrow g a b \in B$

unfolding Finite-Set.fold-def
by (subst fold-graph-closed-eq[where $B=B$ and $g=g$]) (auto simp: that)

A tempting alternative for the definition is if finite $A$ then THE $y$. fold-graph $f z A y$ else $e$. It allows the removal of finiteness assumptions from the theorems fold-comm, fold-reindex and fold-distrib. The proofs become ugly. It is not worth the effort. (???)

lemma finite-imp-fold-graph:
finite $A$ $\Rightarrow$ $\exists x$. fold-graph $f z A x$
by (induct rule: finite-induct) auto

Sometimes, to prove that a set is finite, it is convenient to work with finite subsets and to show that their cardinalities are uniformly bounded. This possibility is formalized in the next criterion.

assumes finite A and asymp-on A R and transp-on A R and A ≠ {}
shows
  bex-min-element: \exists m \in A. \forall x \in A. x \neq m \longrightarrow \neg R x m and
  bex-max-element: \exists m \in A. \forall x \in A. x \neq m \longrightarrow \neg R m x
using (A ≠ {}),
  bex-min-element-with-property[OF assms(1,2,3), of λ- True, simplified]
  bex-max-element-with-property[OF assms(1,2,3), of λ- True, simplified]
by blast+

end

The following alternative form might sometimes be easier to work with.

lemma is-min-element-in-set-iff:
asymp-on A R \implies (\forall y \in A. y \neq x \longrightarrow \neg R y x) \iff (\forall y. R y x \longrightarrow y \notin A)
by (auto dest: asymp-onD)

lemma is-max-element-in-set-iff:

Proof:

The proof involves showing that for any relation $R$ on a finite set $A$, the following holds:

$$\text{asymp-on } A \ R \iff (\forall y \in A. \ y \neq x \rightarrow R \ x \ y) \iff (\forall y. \ R \ x \ y \rightarrow y \notin A)$$

by (auto dest: asymp-onD)

Before delving into the proof, let's define some terms:

- **asymp-on**: A relation $R$ is asymptotic on $A$ if for all $y \in A$, if $y \neq x$ then $R x y$.
- **∀**: Universal quantifier.
- **⇒**: Implication.
- **∀ y ∈ A. y ≠ x → R x y**: For all $y$ in $A$, if $y$ is not equal to $x$, then $R x y$.
- **∀ y. R x y → y ∉ A**: For all $y$, if $R x y$ then $y$ is not in $A$.

The proof begins with the context:

**context begin**

**qualified lemma**

assumes finite $A$ and $A \neq \{\}$ and transp-on $A$ $R$ and totalp-on $A$ $R$

shows

- **bex-least-element**: $\exists l \in A. \ \forall x \in A. \ x \neq l \rightarrow R \ l \ x$
- **bex-greatest-element**: $\exists g \in A. \ \forall x \in A. \ x \neq g \rightarrow R \ x \ g$

20.9 Infinite Sets

Some elementary facts about infinite sets, mostly by Stephan Merz. Beware!
Because "infinite" merely abbreviates a negation, these lemmas may not work
well with blast.

abbreviation infinite :: 'a set ⇒ bool
  where infinite S ≡ ¬ finite S

Infinite sets are non-empty, and if we remove some elements from an infinite
set, the result is still infinite.

lemma infinite-UNIV-nat [iff]: infinite (UNIV :: nat set)
proof
  assume finite (UNIV :: nat set)
  with finite-UNIV-inj-surj [of Suc] show False
    by simp (blast dest: Suc-neq-Zero surjD)
qed

lemma infinite-UNIV-char-0:
infinite (UNIV :: 'a::semiring-char-0 set)
proof
  assume finite (UNIV :: 'a set)
  with subset-UNIV have finite (range of-nat :: 'a set)
    by (rule finite-subset)
  moreover have inj (of-nat :: nat ⇒ 'a)
    by (simp add: inj-on-def)
  ultimately have finite (UNIV :: nat set)
    by (rule finite-imageD)
  then show False
    by simp
qed

lemma infinite-imp-nonempty: infinite S ⇒ S ≠ {} 
  by auto

lemma infinite-remove: infinite S ⇒ infinite (S − {a})

  and \( \forall r \in R. \forall s \in R. r \neq s \rightarrow \text{Domain } r \cap \text{Range } s = \{\} \)
  shows \( \text{wf } (\bigcup R) \)
  using \( \text{assms } \text{wf-UN[of } R \land i] \) by simp

Intuition: We find an \( R \cup S \)-min element of a nonempty subset \( A \) by case distinction.

1. There is a step \( a \rightarrow_{R} b \) with \( a, b \in A \). Pick an \( R \)-min element \( z \) of the (nonempty) set \( \{a \in A \mid \exists b \in A. a \rightarrow_{R} b\} \). By definition, there is \( z' \in A \) s.t. \( z \rightarrow_{R} z' \). Because \( z \) is \( R \)-min in the subset, \( z' \) must be \( R \)-min in \( A \). Because \( z' \) has an \( R \)-predecessor, it cannot have an \( S \)-successor and is thus \( S \)-min in \( A \) as well.

2. There is no such step. Pick an \( S \)-min element of \( A \). In this case it must be an \( R \)-min element of \( A \) as well.

24.5.2 The upper and lower bounds operators

Here we define upper ("above") and lower ("below") bounds operators. We think of \( r \) as a non-strict relation. The suffix \( S \) at the names of some operators indicates that the bounds are strict – e.g., \( \text{underS } a \) is the set of all strict lower bounds of \( a \) (w.r.t. \( r \)). Capitalization of the first letter in the name reminds that the operator acts on sets, rather than on individual elements.

definition under :: \( 'a \ rel \Rightarrow 'a \Rightarrow 'a \ set \)
  where \( \text{under } r \ a \equiv \{b. (b, a) \in r\} \)

definition underS :: \( 'a \ rel \Rightarrow 'a \Rightarrow 'a \ set \)
  where \( \text{underS } r \ a \equiv \{b. b \neq a \land (b, a) \in r\} \)

definition Under :: \( 'a \ rel \Rightarrow 'a \ set \Rightarrow 'a \ set \)
  where \( \text{Under } r \ A \equiv \{b \in Field r. \forall a \in A. (b, a) \in r\} \)

definition UnderS :: \( 'a \ rel \Rightarrow 'a \ set \Rightarrow 'a \ set \)
  where \( \text{UnderS } r \ A \equiv \{b \in Field r. \forall a \in A. b \neq a \land (b, a) \in r\} \)

24.6 Variations on Well-Founded Relations

This subsection contains some variations of the results from HOL. Wellfounded:

- means for slightly more direct definitions by well-founded recursion;
- variations of well-founded induction;
- means for proving a linear order to be a well-order.
24.6.1 Characterizations of well-foundedness

A transitive relation is well-founded iff it is “locally” well-founded, i.e., iff its restriction to the lower bounds of of any element is well-founded.

**lemma** trans-wf-iff:

- **assumes** trans \( r \)
- **shows** \( \forall a. \ wf (r \cap (r^{-1}\cdot\{a\} \times r^{-1}\cdot\{a\}))) \)

**proof**
- **define** \( R \) where \( R a = r \cap (r^{-1}\cdot\{a\} \times r^{-1}\cdot\{a\}) \) \( \) for \( a \)
- **have** \( \forall a. \ wf (R a) \) if \( \forall a. \ wf (r) \) for \( a \)
- **unfolding** \( \) proud

**proof**
- **fix** \( \phi \) \( a \)
- **assume** \( **: \forall a. (\forall b. (b, a) \in r \rightarrow \phi b) \rightarrow \phi a \)
- **define** \( \chi \) where \( \chi b \leftarrow (b, a) \in r \rightarrow \phi b \) for \( b \)
- **with** \( ** \) have \( \forall (R a) \) by auto
- **then have** \( (\forall b. (\forall c. (c, b) \in R a \rightarrow \chi c) \rightarrow \chi b) \rightarrow (\forall b. \ chi b) \)
- **unfolding** \( \) proud by blast
- **also have** \( \forall b. (\forall c. (c, b) \in R a \rightarrow \chi c) \rightarrow \chi b \)
- **proof**
  - **fix** \( b \)
  - **assume** \( \forall c. (c, b) \in R a \rightarrow \chi c \)
  - **moreover** have \( (b, a) \in r \Rightarrow \forall c. (c, b) \in r \land (c, a) \in r \rightarrow \phi c \Rightarrow \phi \) \( b \)
  - **proof**
    - **assume** \( (b, a) \in r \) and \( \forall c. (c, b) \in r \land (c, a) \in r \rightarrow \phi c \)
    - **then have** \( \forall c. (c, b) \in r \rightarrow \phi c \)
      - **using** \( ** \) have \( \forall (of r R a) \) by blast
    - **with** \( ** \) show \( \phi b \) by blast
  - **qed**
  - ultimately show \( \chi b \)
    - **by** \( (auto simp add: chi-def R-def) \)
  - **qed**
  - finally have \( \forall b. \chi b \).
    - **with** \( ** \) chi-def show \( \phi a \) by blast
  - **qed**
  - ultimately show \( \)thesis unfolding \( R-def \) by blast
- ** qed**

A transitive relation is well-founded if all initial segments are finite.

**corollary** wf-finite-segments:

- **assumes** irrefl \( r \) and trans \( r \) and \( \forall x. \ finite \{y. (y, x) \in r\} \)
- **shows** \( \forall a. \ wf (r \cap \{x. (x, a) \in r\} \times \{x. (x, a) \in r\}) \)

**proof**
- **have** \( \forall a. \ acyclic (r \cap \{x. (x, a) \in r\} \times \{x. (x, a) \in r\}) \)
- **proof**
  -
THEORY “Order-Relation”

24.6.2 Characterizations of well-foundedness

The next lemma and its corollary enable one to prove that a linear order is
a well-order in a way which is more standard than via well-foundedness of
the strict version of the relation.

lemma Linear-order-wf-diff-Id:
assumes Linear-order $r$
shows $\forall A \subseteq \text{Field } r. A \neq \{\} \rightarrow (\exists a \in A. \forall a' \in A. (a,a') \in r)$
proof (cases $r \subseteq \text{Id}$)
  case True
  then have $*: r - \text{Id} = \{\}$ by blast
  have $\text{wf} \ (r - \text{Id})$ by ($\text{simp add: } *$)
  moreover have $\exists a \in A. \forall a' \in A. (a,a') \in r$
  if $*: A \subseteq \text{Field } r$ and $**: A \neq \{\}$ for $A$
proof
  from (Linear-order $r$) True
  obtain $a$ where $a: r = \{\} \lor r = \{(a,a)\}$
  unfolding $\text{order-on-defs using } \text{Total-subset-Id}$ of $r$ by blast
  with $**$ have $A = \{a\} \land r = \{(a,a)\}$
  unfolding $\text{Field-def}$ by blast
  with $a$ show $?thesis$ by blast
qed
  ultimately show $?thesis$ by blast
qed

Every infinite set contains a countable subset. More precisely we show that
a set \( S \) is infinite if and only if there exists an injective function from the
naturals into \( S \).

The “only if” direction is harder because it requires the construction of a
sequence of pairwise different elements of an infinite set \( S \). The idea is to
construct a sequence of non-empty and infinite subsets of \( S \) obtained by
successively removing elements of \( S \).

lemma infinite-countable-subset:

26  Zorn’s Lemma and the Well-ordering Theorem

theory Zorn
  imports Order-Relation Hilbert-Choice
begin

26.1  Zorn’s Lemma for the Subset Relation

26.1.1  Results that do not require an order

Let $P$ be a binary predicate on the set $A$.

locale pred-on =
  fixes $A :: \text{'}a$ set
  and $P :: \text{'}a \Rightarrow \text{'}a \Rightarrow \text{bool}$ (infix $\sqsubseteq$ 50)
begin

abbreviation $P_{eq} :: \text{'}a \Rightarrow \text{'}a \Rightarrow \text{bool}$ (infix $\subseteq$ 50)
  where $x \sqsubseteq y \equiv P_{eq} \ x \ y$

A chain is a totally ordered subset of $A$. 
THEORY "Zorn"

definition chain :: 'a set ⇒ bool
  where chain C ⇔ C ⊆ A ∧ (∀ x∈C. ∀ y∈C. x ⊆ y ∨ y ⊆ x)

We call a chain that is a proper superset of some set X, but not necessarily a chain itself, a superchain of X.

abbreviation superchain :: 'a set ⇒ 'a set ⇒ bool (infix <c)
  where X <c C ⇔ chain C ∧ X ⊂ C

A maximal chain is a chain that does not have a superchain.

definition maxchain :: 'a set ⇒ bool
  where maxchain C ⇔ chain C ∧ (∄ S. C <c S)

We define the successor of a set to be an arbitrary superchain, if such exists, or the set itself, otherwise.

definition suc :: 'a set ⇒ 'a set
  where suc C = (if ¬ chain C ∨ maxchain C then SOME D. C <c D)

lemma chainI [Pure.intro?): C ⊆ A ⇒ (∀ x y. x ∈ C ⇒ y ∈ C ⇒ x ⊆ y ∨ y ⊆ x) ⇒ chain C
  unfolding chain-def by blast

lemma chain-total [simp]: chain C ⇒ x ∈ C ⇒ y ∈ C ⇒ x ⊆ y ∨ y ⊆ x
  by (simp add: chain-def)

lemma not-chain-suc [simp]: ¬ chain X ⇒ suc X = X
  by (simp add: suc-def)

lemma maxchain-suc [simp]: maxchain X ⇒ suc X = X
  by (simp add: suc-def)

lemma suc-subset [simp]: X ⊆ suc X
  by (auto simp: suc-def maxchain-def intro: someI2)

lemma chain-empty [simp]: chain {}
  by (auto simp: chain-def)

lemma not-maxchain-Some: chain C ⇒ ¬ maxchain C ⇒ C <c (SOME D. C <c D)
  by (rule someI-ex) (auto simp: maxchain-def)

lemma suc-not-equals: chain C ⇒ ¬ maxchain C ⇒ suc C ≠ C
  using not-maxchain-Some by (auto simp: suc-def)

lemma subset-suc:
  assumes X ⊆ Y
  shows X ⊆ suc Y
  using assms by (rule subset-trans) (rule suc-subset)

We build a set C that is closed under applications of suc and contains the
union of all its subsets.

**inductive-set** *suc-Union-closed* \((C)\)

where

\[
suc \colon X \in C \implies suc X \in C
\]

\[
\mid \text{Union [unfolded Pow-if]: } X \in \text{Pow} C \implies \bigcup X \in C
\]

Since the empty set as well as the set itself is a subset of every set, \(C\) contains at least \(\{\} \in C\) and \(\bigcup C \in C\).

**lemma** *suc-Union-closed-empty*: \(\{} \in C\)

and *suc-Union-closed-Union*: \(\bigcup C \in C\)

**using** Union [of \(\{}\)] and Union [of \(C\)] by simp-all

Thus closure under *suc* will hit a maximal chain eventually, as is shown below.

**lemma** *suc-Union-closed-induct* [consumes 1, case-names suc Union, induct pred: *suc-Union-closed*]:

assumes \(X \in C\)

and \(\forall X. X \subseteq C \implies \forall x \in X. Q x \implies Q (\bigcup X)\)

shows \(Q X\)

using assms by induct blast+

**lemma** *suc-Union-closed-cases* [consumes 1, case-names suc Union, cases pred: *suc-Union-closed*]:

assumes \(X \in C\)

and \(\forall Y. X = suc Y \implies Y \in C \implies Q\)

and \(\forall Y. X = \bigcup Y \implies Y \subseteq C \implies Q\)

shows \(Q\)

using assms by cases simp-all

On chains, *suc* yields a chain.

**lemma** *chain-suc*:

assumes \(\text{chain} X\)

shows \(\text{chain} (suc X)\)

using assms

by (cases ~ chain X \lor maxchain X) (force simp: suc-def dest: not-maxchain-Some)+

**lemma** *chain-sucD*:

assumes \(\text{chain} X\)

shows \(suc X \subseteq A \land \text{chain} (suc X)\)

**proof** –

from ⟨chain X⟩ have *: chain (suc X)

by (rule chain-suc)

then have suc X \(\subseteq A\)

unfolding chain-def by blast

with * show ?thesis by blast

27 Well-Order Relations as Needed by Bounded Natural Functors

theory BNF-Wellorder-Relation
imports Order-Relation
begin

In this section, we develop basic concepts and results pertaining to well-order relations. Note that we consider well-order relations as non-strict relations, i.e., as containing the diagonals of their fields.

locale wo-rel =
fixes R :: 'a rel
assumes WELL: Well-order R
begin

The following context encompasses all this section. In other words, for the whole section, we consider a fixed well-order relation $r$.

abbreviation under where under $\equiv$ Order-Relation.under $r$
abbreviation underS where underS $\equiv$ Order-Relation.underS $r$
abbreviation Under where Under $\equiv$ Order-Relation.Under $r$
abbreviation above where above $\equiv$ Order-Relation.above $r$
abbreviation aboveS where aboveS $\equiv$ Order-Relation.aboveS $r$
abbreviation Above where Above $\equiv$ Order-Relation.Above $r$
abbreviation ofilter where ofilter $\equiv$ Order-Relation.ofilter $r$

lemmas ofilter-def = Order-Relation.ofilter-def[of $r$]

$\implies \phi i a b$
using TOTALS by auto

lemma cases-Total3:
$\bigwedge \phi i a b. \{\{a,b\} \leq \text{Field } r; ((a,b) \in r - \text{Id} \lor (b,a) \in r - \text{Id} \implies \phi i a b); (a = b \implies \phi i a b)\}$
$\implies \phi i a b$
using TOTALS by auto
27.2 Well-founded induction and recursion adapted to non-strict well-order relations

Here we provide induction and recursion principles specific to non-strict well-order relations. Although minor variations of those for well-founded relations, they will be useful for doing away with the tediousness of having to take out the diagonal each time in order to switch to a well-founded relation.

**Lemma** well-order-induct:
- **Assumes**: \( \forall x. \forall y. y \neq x \land (y, x) \in r \implies P y \implies P x \)
- **Shows**: \( P a \)

**Proof** 
- Have: \( \forall x. \forall y. (y, x) \in r - Id \implies P y \implies P x \)
- Using IND by blast
- Thus \( P a \) using WF wf-induct[of \( r - Id \) \( P a \)] by blast

**Qed**

**Definition** worec :: \( (\forall a \Rightarrow b) \Rightarrow a \Rightarrow b \)
- Where
  \( \text{worec } F \equiv \text{wfrec } (r - Id) F \)

**Definition** adm-wo :: \( (\forall a \Rightarrow b) \Rightarrow a \Rightarrow b \Rightarrow \text{bool} \)
- Where
  \( \text{adm-wo } H \equiv \forall f \ g \ x. (\forall y \in \text{underS } x. f y = g y) \implies H f x = H g x \)

**Lemma** worec-fixpoint:
- **Assumes**: ADM: adm-wo \( H \)
- **Shows**: \( \text{worec } H = H (\text{worec } H) \)

**Proof**
- Let \( r' = r - Id \)
- Have: adm-wo \( r - Id \) \( H \)
- Unfolding adm-wo-def
  - Using ADM adm-wo-def[of \( H \)] underS-def[of \( r \)] by auto
- Hence \( \text{wfrec } r' S H = H (\text{wfrec } r' S H) \)
  - Using WF wfrec-fixpoint[of \( r' S H \)] by simp
- Thus ?thesis unfolding worec-def.

**Qed**

27.3 The notions of maximum, minimum, supremum, successor and order filter

We define the successor of a set, and not of an element (the latter is of course a particular case). Also, we define the maximum of two elements, \( \text{max2} \), and the minimum of a set, \( \text{minim} \) – we chose these variants since we consider them the most useful for well-orders. The minimum is defined in terms of the auxiliary relational operator \( \text{isMinim} \). Then, supremum and
successor are defined in terms of minimum as expected. The minimum is only meaningful for non-empty sets, and the successor is only meaningful for sets for which strict upper bounds exist. Order filters for well-orders are also known as “initial segments”.

**definition** \( \text{max2} :: \ 'a \Rightarrow \ 'a \rightarrow \ 'a \) where \( \text{max2} a b \equiv \begin{cases} b & \text{if } (a, b) \in r \text{ then } b \text{ else } a \end{cases} \)

**definition** \( \text{isMinim} :: \ 'a \text{ set } \Rightarrow \ 'a \Rightarrow \ ) where \( \text{isMinim} A b \equiv b \in A \land (\forall a \in A. (b, a) \in r) \)

**definition** \( \text{minim} :: \ 'a \text{ set } \Rightarrow \ 'a \) where \( \text{minim} A \equiv \text{THE } \text{b. isMinim } A \text{ b} \)

**definition** \( \text{supr} :: \ 'a \text{ set } \Rightarrow \ 'a \) where \( \text{supr} A \equiv \text{minim } \text{(Above } A) \)

**definition** \( \text{suc} :: \ 'a \text{ set } \Rightarrow \ 'a \) where \( \text{suc} A \equiv \text{minim } \text{(AboveS } A) \)

28 Well-Order Embeddings as Needed by Bounded Natural Functors

theory BNF-Wellorder-Embedding
imports Hilbert-Choice BNF-Wellorder-Relation
begin
In this section, we introduce well-order embeddings and isomorphisms and prove their basic properties. The notion of embedding is considered from the
point of view of the theory of ordinals, and therefore requires the source to be injected as an initial segment (i.e., order filter) of the target. A main result of this section is the existence of embeddings (in one direction or another) between any two well-orders, having as a consequence the fact that, given any two sets on any two types, one is smaller than (i.e., can be injected into) the other.

### 28.1 Auxiliaries

**Lemma** *UNION-inj-on-ofilter*: 
- **Assumes**: WELL: Well-order \( r \) and 
  \( OF: \bigwedge i. i \in I \Rightarrow wo\cdotrel\cdotfilter r (A i) \) and 
  INJ: \( \bigwedge i. i \in I \Rightarrow inj\cdoton f (A i) \) 
- **Shows**: \( inj\cdoton f (\bigcup i \in I. A i) \)

**Proof** –
- have \( wo\cdotrel r \) using WELL by (simp add: wo\cdotrel\cdotdef)
  hence \( \bigwedge i. j. [i \in I; j \in I] \Rightarrow A i \leq A j \vee A j \leq A i \)
  using wo\cdotrel\cdotfilter\cdotlinord[of r] OF by blast
- with WELL INJ show \(?thesis\)

    hence \( \text{under } r a = \text{underS } r a \cup \{ a \} \land \text{under } r’ (f a) = \text{underS } r’ (f a) \cup \{ f a \} \)
    using IN IN’ by(auto simp add: Refl\cdotunder\cdotunderS) \}
- ultimately show \(?thesis\)
  using BIJ notIn\cdotUn\cdotbij\cdotbetw[of a underS r a f underS r’ (f a)] by auto

qed

### 28.2 (Well-order) embeddings, strict embeddings, isomorphisms and order-compatible functions

Standardly, a function is an embedding of a well-order in another if it injectively and order-compatibly maps the former into an order filter of the latter. Here we opt for a more succinct definition (operator *embed*), asking that, for any element in the source, the function should be a bijection
between the set of strict lower bounds of that element and the set of strict lower bounds of its image. (Later we prove equivalence with the standard definition – lemma embed-iff-compat-inj-ofilter.) A strict embedding (operator embedS) is a non-bijective embedding and an isomorphism (operator iso) is a bijective embedding.

**definition** embed :: 'a rel ⇒ 'a' rel ⇒ ('a ⇒ 'a') ⇒ bool
  where
  embed r r' f ≡ ∀ a ∈ Field r. bij-betw f (under r a) (under r' (f a))

**lemmas** embed-defs = embed-def embed-def[abs-def]

Strict embeddings:

**definition** embedS :: 'a rel ⇒ 'a' rel ⇒ ('a ⇒ 'a') ⇒ bool
  where
  embedS r r' f ≡ embed r r' f ∧ ¬ bij-betw f (Field r) (Field r')

**lemmas** embedS-defs = embedS-def embedS-def[abs-def]

**definition** iso :: 'a rel ⇒ 'a' rel ⇒ ('a ⇒ 'a') ⇒ bool
  where
  iso r r' f ≡ embed r r' f ∧ bij-betw f (Field r) (Field r')

**lemmas** iso-defs = iso-def iso-def[abs-def]

**definition** compat :: 'a rel ⇒ 'a' rel ⇒ ('a ⇒ 'a') ⇒ bool
  where
  compat r r' f ≡ ∀ a b. (a, b) ∈ r −→ (f a, f b) ∈ r'

**lemma** compat-wf:
  assumes CMP: compat r r' f and WF: wf r'
  shows wf r
  proof -
  have r ≤ inv-image r' f

proof (rule bij-betw-inv-into-subset [OF BIJ])
28.3 Given any two well-orders, one can be embedded in the other

Here is an overview of the proof of of this fact, stated in theorem wellorders-totally-ordered:

Fix the well-orders \( r :: 'a \ rel \) and \( r' :: 'a' \ rel \). Attempt to define an embedding \( f :: 'a \Rightarrow 'a' \) from \( r \) to \( r' \) in the natural way by well-order recursion ("hoping" that \( \text{Field } r \) turns out to be smaller than \( \text{Field } r' \)), but also record, at the recursive step, in a function \( g :: 'a \Rightarrow \text{bool} \), the extra information of whether \( \text{Field } r' \) gets exhausted or not.

If \( \text{Field } r' \) does not get exhausted, then \( \text{Field } r \) is indeed smaller and \( f \) is the desired embedding from \( r \) to \( r' \) (lemma wellorders-totally-ordered-aux).

Otherwise, it means that \( \text{Field } r' \) is the smaller one, and the inverse of (the 'good' segment of) \( f \) is the desired embedding from \( r' \) to \( r \) (lemma wellorders-totally-ordered-aux2).

lemma wellorders-totally-ordered-aux:
fixes \( r :: 'a \ rel \) and \( r' :: 'a' \ rel \) and
\( f :: 'a \Rightarrow 'a' \) and \( a :: 'a' \)
assumes WELL: Well-order \( r \) and \( r' \) and\( IN: a \in \text{Field } r \)

29 Constructions on Wellorders as Needed by Bounded Natural Functors

theory BNF-Wellorder-Constructions
  imports BNF-Wellorder-Embedding
begin

In this section, we study basic constructions on well-orders, such as restriction to a set/order filter, copy via direct images, ordinal-like sum of disjoint well-orders, and bounded square. We also define between well-orders the relations $\text{ordLeq}$, of being embedded (abbreviated $\leq o$), $\text{ordLess}$, of being strictly embedded (abbreviated $< o$), and $\text{ordIso}$, of being isomorphic (abbreviated $= o$). We study the connections between these relations, order filters, and the aforementioned constructions. A main result of this section is that $< o$ is well-founded.

29.1 Restriction to a set

abbreviation Restr :: 'a rel $\Rightarrow$ 'a set $\Rightarrow$ 'a rel
  where Restr $r A \equiv r \text{ Int } (A \times A)$

lemma Restr-subset:
\( A \leq B \implies \text{Restr} (\text{Restr} r B) A = \text{Restr} r A \)

by blast

lemma Restr-Field: \( \text{Restr} r (\text{Field} r) = r \)

29.4 Ordering the well-orders by existence of embeddings

We define three relations between well-orders:

- **ordLeq**, of being embedded (abbreviated ≤ o);
- **ordLess**, of being strictly embedded (abbreviated < o);
• ordIso, of being isomorphic (abbreviated =o).

The prefix "ord" and the index "o" in these names stand for "ordinal-like". These relations shall be proved to be inter-connected in a similar fashion as the trio \(\leq, <, =\) associated to a total order on a set.

**definition ordLeq :: \(\langle \mathcal{L} \rangle \rel \times \mathcal{L} \rel \) set**
where
\[
\text{ordLeq} = \{ (r, r') : \text{Well-order } r \land \text{Well-order } r' \land (\exists f. \text{embed } r, r' f) \}
\]

**abbreviation ordLeq2 :: \(\langle \mathcal{L} \rangle \rel \Rightarrow \mathcal{L} \rel \Rightarrow \) bool** (infix \(\leq_o\ 50\))
where \(r \leq_o r' \equiv (r, r') \in \text{ordLeq}\)

**abbreviation ordLeq3 :: \(\langle \mathcal{L} \rangle \rel \Rightarrow \mathcal{L} \rel \Rightarrow \) bool** (infix \(<_o\ 50\))
where \(r <_o r' \equiv (r, r') \in \text{ordLeq}\)

**definition ordLess :: \(\langle \mathcal{L} \rangle \rel \times \mathcal{L} \rel \) set**
where
\[
\text{ordLess} = \{ (r, r') : \text{Well-order } r \land \text{Well-order } r' \land (\exists f. \text{embedS } r, r' f) \}
\]

**abbreviation ordLess2 :: \(\langle \mathcal{L} \rangle \rel \Rightarrow \mathcal{L} \rel \Rightarrow \) bool** (infix \(<_o\ 50\))
where \(r <_o r' \equiv (r, r') \in \text{ordLess}\)

**definition ordIso :: \(\langle \mathcal{L} \rangle \rel \times \mathcal{L} \rel \) set**
where
\[
\text{ordIso} = \{ (r, r') : \text{Well-order } r \land \text{Well-order } r' \land (\exists f. \text{iso } r, r' f) \}
\]

**abbreviation ordIso2 :: \(\langle \mathcal{L} \rangle \rel \Rightarrow \mathcal{L} \rel \Rightarrow \) bool** (infix \(=_o\ 50\))
where \(r =_o r' \equiv (r, r') \in \text{ordIso}\)

**lemmas ordRels-def = ordLeq-def ordLess-def ordIso-def**

**lemma ordLeq-Well-order-simp:**
assumes \(r \leq_o r'\)
shows \(\text{Well-order } r \land \text{Well-order } r'\)
using assms unfolding ordLeq-def by simp

Notice that the relations \(\leq_o, <_o, =_o\) connect well-orders on potentially distinct types. However, some of the lemmas below, including the next one, restrict implicitly the type of these relations to \(\langle \mathcal{L} \rangle \rel \times \mathcal{L} \rel \) set, i.e., to \(\mathcal{L} \rel \).

**lemma ordLeq-reflexive:**
Well-order \(r \Rightarrow r \leq_o r\)

29.5 <o is well-founded

Of course, it only makes sense to state that the <o is well-founded on the restricted type 'a rel rel. We prove this by first showing that, for any set of well-orders all embedded in a fixed well-order, the function mapping each well-order in the set to an order filter of the fixed well-order is compatible w.r.t. to <o versus strict inclusion; and we already know that strict inclusion of order filters is well-founded.

definition ord-to-filter :: 'a rel rel ⇒ 'a set
where ord-to-filter r0 r ≡ (SOME f. embed r r0 f) ' (Field r)

29.7 Bounded square

This construction essentially defines, for an order relation \( r \), a lexicographic order \( \text{bsqr} \, r \) on \((\text{Field} \, r) \times (\text{Field} \, r)\), applying the following criteria (in this order):

- compare the maximums;
- compare the first components;
- compare the second components.

The only application of this construction that we are aware of is at proving that the square of an infinite set has the same cardinal as that set. The essential property required there (and which is ensured by this construction) is that any proper order filter of the product order is included in a rectangle, i.e., in a product of proper filters on the original relation (assumed to be a well-order).

definition \( \text{bsqr} :: \{a \ rel \} = \{a * a \rel\}
where
\begin{align*}
\text{bsqr} & = \{(a1,a2),(b1,b2)\} \leq \text{Field} \, r \\

30  Cardinal-Order Relations as Needed by Bounded Natural Functors

theory BNF-Cardinal-Order-Relation
  imports Zorn BNF-Wellorder-Constructions
begin

In this section, we define cardinal-order relations to be minim well-orders on
their field. Then we define the cardinal of a set to be some cardinal-order
relation on that set, which will be unique up to order isomorphism. Then
we study the connection between cardinals and:

• standard set-theoretic constructions: products, sums, unions, lists, pow-
ersets, set-of finite sets operator;

• finiteness and infiniteness (in particular, with the numeric cardinal
  operator for finite sets, card, from the theory Finite-Sets.thy).

On the way, we define the canonical ω cardinal and finite cardinals. We
also define (again, up to order isomorphism) the successor of a cardinal, and
show that any cardinal admits a successor.

Main results of this section are the existence of cardinal relations and the
facts that, in the presence of infiniteness, most of the standard set-theoretic
constructions (except for the powerset) do not increase cardinality. In particular, e.g., the set of words/lists over any infinite set has the same cardinality (hence, is in bijection) with that set.

30.1 Cardinal orders

A cardinal order in our setting shall be a well-order \(\text{minim}\) w.r.t. the order-embedding relation, \(\leq_o\) (which is the same as being \(\text{minimal}\) w.r.t. the strict order-embedding relation, \(<_o\) ), among all the well-orders on its field.

**definition** \(\text{card-order-on}::'a\ set\Rightarrow'a\ rel\Rightarrow\text{bool}\)

\(\text{card-order-on } A\ r\equiv\text{well-order-on } A\ r\land(\forall r'.\text{well-order-on } A\ r'\rightarrow r\leq_o r')\)

**abbreviation** \(\text{Card-order } r\equiv\text{card-order-on } (\text{Field } r)\ r\)

**abbreviation** \(\text{card-order } r\equiv\text{card-order-on } \text{UNIV } r\)

**lemma** \(\text{card-order-on-well-order-on}:\)

assumes \(\text{card-order-on } A\ r\)

shows \(\text{well-order-on } A\ r\)

using assms unfolding card-order-on-def by simp

**lemma** \(\text{card-order-on-Card-order}:\)

\(\text{card-order-on } A\ r\Rightarrow A=\text{Field } r\land\text{Card-order } r\)

unfolding card-order-on-def using well-order-on-Field by blast

The existence of a cardinal relation on any given set (which will mean that any set has a cardinal) follows from two facts:

- Zermelo’s theorem (proved in Zorn.thy as theorem well-order-on), which states that on any given set there exists a well-order;

- The well-founded-ness of \(<_o\), ensuring that then there exists a minimal such well-order, i.e., a cardinal order.

**theorem** \(\text{card-order-on}::\exists r.\text{card-order-on } A\ r\)

**proof** –

define \(R\ where\ R\equiv\{r.\text{well-order-on } A\ r\}\)

have \(R\neq\\{\}\\land(\forall r\in R.\text{Well-order } r)\)

30.4 Cardinals versus set operations involving infinite sets

Here we show that, for infinite sets, most set-theoretic constructions do not
increase the cardinality. The cornerstone for this is theorem Card-order-Times-same-infinite,
which states that self-product does not increase cardinality – the proof of
this fact adapts a standard set-theoretic argument, as presented, e.g., in the
proof of theorem 1.5.11 at page 47 in [4]. Then everything else follows fairly
easily.

lemma infinite-iff-card-of-nat:
  ¬ finite A ⇔ ( |UNIV::nat set| ≤o |A| )
  unfolding infinite-iff-countable-subset card-of-ordLeq ..

The next two results correspond to the ZF fact that all infinite cardinals are
limit ordinals:
idea Card-order-infinite-not-under:
assumes CARD: Card-order r and INF: ¬finite (Field r)
sows ¬ (∃a. Field r = under r a)
proof
have 0: Well-order r ∧ wo-rel r ∧ Refl r

30.5 The cardinal \( \omega \) and the finite cardinals

The cardinal \( \omega \), of natural numbers, shall be the standard non-strict order relation on \text{nat}, that we abbreviate by \text{natLeq}. The finite cardinals shall be the restrictions of these relations to the numbers smaller than fixed numbers \( n \), that we abbreviate by \text{natLeq-on } n.

definition \( \text{natLeq} :: (\text{nat} \times \text{nat}) \) set \( \equiv \{(x,y). \ x \leq y\} \)
definition \( \text{natLess} :: (\text{nat} \times \text{nat}) \) set \( \equiv \{(x,y). \ x < y\} \)

abbreviation \( \text{natLeq-on} :: \text{nat} \Rightarrow (\text{nat} \times \text{nat}) \) set
where \( \text{natLeq-on } n \equiv \{(x,y). \ x < n \wedge y < n \wedge x \leq y\} \)

30.6 The successor of a cardinal

First we define \( \text{isCardSuc } r r' \), the notion of \( r' \) being a successor cardinal of \( r \). Although the definition does not require \( r \) to be a cardinal, only this case will be meaningful.

definition isCardSuc :: 'a rel ⇒ 'a set rel ⇒ bool
  where isCardSuc r r' ≡
    Card-order r' ∧ r < o r' ∧
    (∀ (r'': 'a set rel). Card-order r'' ∧ r < o r'' → r' ≤ o r'')

Now we introduce the cardinal-successor operator \( \text{cardSuc} \), by picking some cardinal-order relation fulfilling \( \text{isCardSuc} \). Again, the picked item shall be proved unique up to order-isomorphism.

definition cardSuc :: 'a rel ⇒ 'a set rel
  where cardSuc r ≡ SOME r'. isCardSuc r r'

lemma exists-minim-Card-order:
  \[ R ≠ \{\}; ∀ r ∈ R. Card-order r \] ⇒ ∃ r ∈ R. ∀ r' ∈ R. r ≤ o r'
unfolding card-order-on-def using exists-minim-Well-order by blast

lemma exists-isCardSuc:
assumes Card-order r
shows ∃r′. isCardSuc r r′
proof -
  let ?R = {{r′::'a set rel}. Card-order r′ ∧ r <o r′}
  have |Pow(Field r)| ∈ ?R ∧ (∀r ∈ ?R. Card-order r) using assms
      by (simp add: card-of-Card-order Card-order-Pow)
  then obtain r where r ∈ ?R ∧ (∀r′ ∈ ?R. r ≤o r′)
      using exists-minim-Card-order[of ?R] by blast
  thus ?thesis unfolding isCardSuc-def by auto
qed

lemma cardSuc-isCardSuc:
assumes Card-order r
shows isCardSuc r (cardSuc r)
unfolding cardSuc-def using assms
by (simp add: exists-isCardSuc someI-ex)

lemma cardSuc-Card-order:
  Card-order r ⇒ Card-order(cardSuc r)
using cardSuc-isCardSuc unfolding isCardSuc-def by blast

lemma cardSuc-greater:
  Card-order r ⇒ r <o cardSuc r
using cardSuc-isCardSuc unfolding isCardSuc-def by blast

lemma cardSuc-ordLeq:
  Card-order r ⇒ r ≤o cardSuc r
using cardSuc-greater ordLeq-iff-ordLess-or-ordIso by blast

The minimality property of cardSuc originally present in its definition is
local to the type 'a set rel, i.e., that of cardSuc r:

lemma cardSuc-least-aux:
  [Card-order (r::'a rel); Card-order (r′::'a set rel); r <o r′] ⇒ cardSuc r ≤o r′
using cardSuc-isCardSuc unfolding isCardSuc-def by blast

But from this we can infer general minimality:

lemma cardSuc-least:
assumes CARD: Card-order r and CARD′: Card-order r′ and LESS: r <o r′
shows cardSuc r ≤o r′
proof -
  let ?p = cardSuc r
  have 0: Well-order ?p ∧ Well-order r′
      using assms cardSuc-Card-order unfolding card-order-on-def by blast
  { assume r′ <o ?p
    then obtain r″ where 1: Field r″ < Field ?p and 2: r′ =o r″ ∧ r″ <o ?p

\item \textbf{by} \textit{fast+}
\end{itemize}

Generation of contrapositives
Inserts negated disjunct after removing the negation; P is a literal. Model elimination requires assuming the negation of every attempted subgoal, hence the negated disjuncts.

**Lemma** make-neg-rule: \( \neg P \lor Q \Rightarrow ((\neg P \Rightarrow P) \Rightarrow Q) \)

**Lemma** make-refined-neg-rule: \( \neg P \lor Q \Rightarrow (P \Rightarrow Q) \)

\( P \) should be a literal

**Lemma** make-pos-rule: \( P \lor Q \Rightarrow ((P \Rightarrow \neg P) \Rightarrow Q) \)

Versions of **make-neg-rule** and **make-pos-rule** that don’t insert new assumptions, for ordinary resolution.

**Lemma** make-neg-rule\(^\prime\) = make-refined-neg-rule

**Lemma** make-pos-rule\(^\prime\): \([ \neg P \lor Q; \neg P ] \Rightarrow Q\)

Generation of a goal clause – put away the final literal

**Lemma** make-neg-goal: \( \neg P \Rightarrow ((\neg P \Rightarrow P) \Rightarrow False) \)

**Lemma** make-pos-goal: \( P \Rightarrow ((P \Rightarrow \neg P) \Rightarrow False) \)

### 39.3 Lemmas for Forward Proof

There is a similarity to congruence rules. They are also useful in ordinary proofs.

**Lemma** conj-forward: \([P \land Q; P' \Rightarrow P; Q' \Rightarrow Q] \Rightarrow P \land Q\)

**Lemma** disj-forward: \([P \lor Q; P' \Rightarrow P; Q' \Rightarrow Q] \Rightarrow P \lor Q\)

**Lemma** imp-forward: \([P' \Rightarrow Q; P \Rightarrow P'; Q' \Rightarrow Q] \Rightarrow P \Rightarrow Q\)

**Lemma** imp-forward2: \([P' \Rightarrow Q; P \Rightarrow P'; P' \Rightarrow Q' \Rightarrow Q] \Rightarrow P \Rightarrow Q\)

**Lemma** disj-forward2: \([ P' \lor Q; P' \Rightarrow P; [Q; P \Rightarrow False] \Rightarrow Q] \Rightarrow P \lor Q\)

apply blast
done

**lemma** all-forward: \[ \forall x. P'(x); \ \forall x. P'(x) \implies P(x) \implies \forall x. P(x) \]
by blast

**lemma** ex-forward: \[ \exists x. P'(x); \ \forall x. P'(x) \implies P(x) \implies \exists x. P(x) \]
by blast

### 39.4 Clausification helper

\text{lemma fAll-law:}
fNot (fAll R) ↔ fEx (fComp R)
\text{unfolding fNot-def fComp-def fAll-def fEx-def by auto}

\text{lemma fequal-laws:}
fequal x y = fequal y x
fequal x y = fFalse ∨ fequal y z = fFalse ∨ fequal x z = fTrue
\text{unfolding fFalse-def fTrue-def fequal-def by auto}

\text{lemma fChoice-iff-Ex: P (fChoice P) ↔ HOL.Ex P}
\text{unfolding fChoice-def by (fact some-eq-ex)}

We use the \textit{Ex} constant on the right-hand side of \textit{fChoice-iff-Ex} because we want to use the TPTP-native version if \textit{fChoice} is introduced in a logic that supports FOOL. In logics that don’t support it, it gets replaced by \textit{fEx} during processing. Notice that we cannot use \( \exists x. P x \), as existentials are not skolemized by the \textit{metis} proof method but \( \textit{Ex P} \) is eta-expanded if FOOL is supported.

unfolding iszero-def by (rule eq-iff-diff-eq-0)

The eq-numeral-iff-iszero lemmas are not declared [simp] by default, because
for rings of characteristic zero, better simp rules are possible. For a type like
integers mod n, type-instantiated versions of these rules should be added to
the simplifier, along with a type-specific rule for deciding propositions of the
form iszero (numeral w).

bh: Maybe it would not be so bad to just declare these as simp rules anyway?
I should test whether these rules take precedence over the ring-char-0 rules
in the simplifier.

46.6.1 Special Simplification for Constants
These distributive laws move literals inside sums and differences.
lemmas distrib-right-numeral [simp] = distrib-right [of - - numeral v] for v
lemmas distrib-left-numeral [simp] = distrib-left [of numeral v] for v
lemmas left-diff-distrib-numeral [simp] = left-diff-distrib [of - - numeral v] for v
lemmas right-diff-distrib-numeral [simp] = right-diff-distrib [of numeral v] for v

These are actually for fields, like real
lemmas zero-less-divide-iff-numeral [simp, no-atp] = zero-less-divide-iff [of numeral w] for w
lemmas divide-less-0-iff-numeral [simp, no-atp] = divide-less-0-iff [of numeral w] for w
lemmas zero-le-divide-iff-numeral [simp, no-atp] = zero-le-divide-iff [of numeral w] for w
lemmas divide-le-0-iff-numeral [simp, no-atp] = divide-le-0-iff [of numeral w] for w

Replaces inverse #nn by 1/#nn. It looks strange, but then other simprocs simplify the quotient.
lemmas inverse-eq-divide-numeral [simp] = inverse-eq-divide [of numeral w] for w
lemmas inverse-eq-divide-neg-numeral [simp] = inverse-eq-divide [of - numeral w] for w

These laws simplify inequalities, moving unary minus from a term into the literal.
lemmas equation-minus-iff-numeral [no-atp] = equation-minus-iff [of numeral v] for v
lemmas minus-equation-iff-numeral [no-atp] = minus-equation-iff [of - numeral v] for v
lemmas le-minus-iff-numeral [no-atp] = le-minus-iff [of numeral v] for v
lemmas minus-le-iff-numeral [no-atp] = 
  minus-le-iff [of - numeral v] for v

lemmas less-minus-iff-numeral [no-atp] = 
  less-minus-iff [of numeral v] for v

lemmas minus-less-iff-numeral [no-atp] = 
  minus-less-iff [of - numeral v] for v

Cancellation of constant factors in comparisons (< and ≤)

lemmas mult-less-cancel-left-numeral [simp, no-atp] = 
  mult-less-cancel-left [of numeral v] for v
lemmas mult-less-cancel-right-numeral [simp, no-atp] = 
  mult-less-cancel-right [of - numeral v] for v
lemmas mult-le-cancel-left-numeral [simp, no-atp] = 
  mult-le-cancel-left [of numeral v] for v
lemmas mult-le-cancel-right-numeral [simp, no-atp] = 
  mult-le-cancel-right [of - numeral v] for v

Multiplying out constant divisors in comparisons (<, ≤ and =)

named-theorems divide-const-simps simplication rules to simplify comparisons involving constant divisors

lemmas le-divide-eq-numeral1 [simp,divide-const-simps] = 
  pos-le-divide-eq [of numeral w, OF zero-less-numeral]
  neg-le-divide-eq [of - numeral w, OF neg-numeral-less-zero] for w

48.2 Generalized summation over a set

context comm-monoid-add
begin

sublocale sum: comm-monoid-set plus 0
  defines sum = sum.\( F \) and sum' = sum.\( G \) ..

abbreviation Sum \((\sum)\)
  where \( \sum \equiv \) sum \((\lambda x. \, x)\)

end

Now: lots of fancy syntax. First, \( \sum (\lambda x. \, e) \) \( A \) is written \( \sum x \in A. \, e \).

syntax\ (ASCII)
\(-sum::\pttrn \Rightarrow 'a \Rightarrow 'b::\text{comm-monoid-add} \ ((3SUM \ (-|\)-)/ -) \ [0, 51, 10] 10)\)
syntax\ 
\(-qsum::\pttrn \Rightarrow \text{bool} \Rightarrow 'a \Rightarrow 'a::\text{comm-monoid-add} \ ((2\sum (-|\)-)/ -) \ [0, 51, 10] 10)\)
translations — Beware of argument permutation!
\( \sum i \in A. \, b = \) CONST sum\ (\( \lambda i. \, b \) \( A \))

Instead of \( \sum x \in \{ x. \, P \}. \, e \) we introduce the shorter \( \sum x | P. \, e \).

syntax\ (ASCII)
\(-qsum::\pttrn \Rightarrow \text{bool} \Rightarrow 'a \Rightarrow 'a::\text{comm-monoid-add} \ ((3SUM \ -|\ -)/ -) \ [0, 0, 10] 10)\)
syntax

54.18 Powers with integer exponents

The following allows writing powers with an integer exponent. While the
type signature is very generic, most theorems will assume that the underlying
type is a division ring or a field.
The notation ‘powi’ is inspired by the ‘powr’ notation for real/complex ex-
ponentiation.

56.5 Division on \textit{int}

The following specification of integer division rounds towards minus infinity
and is advocated by Donald Knuth. See [5] for an overview and terminology
of different possibilities to specify integer division; there division rounding
towards minus infinity is named “F-division”.

56.5.1 Basic instantiation

instantiation \textit{int} :: {normalization-semidom, idom-modulo}
begin

definition normalize-int :: \langle \textit{int} \Rightarrow \textit{int} \rangle
  where [simp]: \langle normalize = (abs :: \textit{int} \Rightarrow \textit{int}) \rangle

definition unit-factor-int :: \langle \textit{int} \Rightarrow \textit{int} \rangle
  where [simp]: \langle unit-factor = (sgn :: \textit{int} \Rightarrow \textit{int}) \rangle

definition divide-int :: \langle \textit{int} \Rightarrow \textit{int} \Rightarrow \textit{int} \rangle
  where \langle k \div l = (sgn k \ast sgn l \ast int (nat |k| \div nat |l|)) \rangle
THEORY “Euclidean-Rings”

lemma divide-int-unfold:
\((\text{sgn } k \ast \text{int } m) \div (\text{sgn } l \ast \text{int } n) = (\text{sgn } k \ast \text{sgn } l \ast \text{int } (m \div n))\)
\((\text{of-bool } ((k = 0 \longleftrightarrow m = 0) \land l \neq 0 \land n \neq 0 \land \text{sgn } k \neq \text{sgn } l \land \neg n \text{ dvd } m))\)
by (simp add: divide-int-def sgn-mult nat-mult-distrib abs-mult sgn-eq-0-iff ac-simps)

definition modulo-int :: \(\text{int} \Rightarrow \text{int} \Rightarrow \text{int}\)
where
\(k \mod l = \text{sgn } k \ast \text{int } (\text{nat } |k| \mod \text{nat } |l|) + l \ast \text{of-bool } (\text{sgn } k \neq \text{sgn } l \land \neg l \text{ dvd } k)\)

57.6  Generic symbolic computations

The following type class contains everything necessary to formulate a division algorithm in ring structures with numerals, restricted to its positive segments.

```
class linordered-euclidean-semiring-division = linordered-euclidean-semiring +
  fixes divmod :: 'a ⇒ 'a ⇒ 'a × 'a — These are conceptually definitions
  and divmod-step :: 'a ⇒ 'a × 'a ⇒ 'a × 'a — These are conceptually definitions
  but force generated code to be monomorphic wrt. particular instances of this class
  which yields a significant speedup.

assumes divmod-def: divmod m n = (numeral m div numeral n, numeral m mod numeral n)
  and divmod-step-def [simp]: divmod-step l (q, r) =
    (if euclidean-size l ≤ euclidean-size r then (2 * q + 1, r - l)
     else (2 * q, r)) — This is a formulation of one step (referring to one
digit position) in school-method division: compare the dividend at the current
digit position with the remainder from previous division steps and evaluate accordingly.
```

```
begin

lemma fst-divmod:
  fst (divmod m n) = numeral m div numeral n
by (simp add: divmod-def)

lemma snd-divmod:
  snd (divmod m n) = numeral m mod numeral n
by (simp add: divmod-def)

Following a formulation of school-method division. If the divisor is smaller
than the dividend, terminate. If not, shift the dividend to the right until
termination occurs and then reiterate single division steps in the opposite
direction.

lemma divmod-divmod-step:
  divmod m n = (if m < n then (0, numeral m)

{l<..} == {l..<} Int {..u}

definition atLeastAtMost :: 'a => 'a => 'a set ((1 {...}) where
{1..<u} == {1..} Int {..u}

end

A note of warning when using $\{..<n\}$ on type nat: it is equivalent to $\{0..<n\}$
but some lemmas involving \{m..<n\} may not exist in \{..<n\}-form as well.

61.5 Intervals of natural numbers

61.5.1 The Constant lessThan

lemma lessThan-0 [simp]: lessThan 0 = nat = \{
by (simp add: lessThan-def)

lemma lessThan-Suc: lessThan (Suc k) = insert k (lessThan k)
by (simp add: lessThan-def less-Suc-eq, blast)

The following proof is convenient in induction proofs where new elements get indices at the beginning. So it is used to transform \{..<Suc n\} to 0 and \{..<n\}.

lemma zero-notin-Suc-image [simp]: 0 \notin Suc A
by auto

lemma lessThan-Suc-eq-insert-0: \{..<Suc n\} = insert 0 (Suc \{..<n\})
by (auto simp: image-iff less-Suc-eq-0-disj)

lemma lessThan-Suc-atMost: lessThan (Suc k) = atMost k
by (simp add: lessThan-def atMost-def less-Suc-eq-le)

lemma atMost-Suc-eq-insert-0: \{.. Suc n\} = insert 0 (Suc \{.. n\})
unfolding lessThan-Suc-atMost[symmetric] lessThan-Suc-eq-insert-0[of Suc n]
..

lemma UN-lessThan-UNIV: \(\bigcup m::nat. \text{lessThan } m\) = UNIV
by blast

61.5.2 The Constant greaterThan

lemma greaterThan-0: greaterThan 0 = range Suc
unfolding greaterThan-def
by (blast dest: gr0-conv-Suc [THEN iffD1])

lemma greaterThan-Suc: greaterThan (Suc k) = greaterThan k - \{Suc k\}
unfolding greaterThan-def
by (auto elim: linorder-neqE)

lemma INT-greaterThan-UNIV: \(\bigcap m::nat. \text{greaterThan } m\) = \{
by blast
61.5.3 The Constant atLeast

**lemma atLeast-0 [simp]:** atLeast (0 :: nat) = UNIV 
by (unfold atLeast-def UNIV-def, simp)

**lemma atLeast-Suc:** atLeast (Suc k) = atLeast k - {k} 
unfolding atLeast-def by (auto simp: order-le-less Suc-le-eq)

**lemma atLeast-Suc-greaterThan:** atLeast (Suc k) = greaterThan k 
by (auto simp add: greaterThan-def atLeast-def less-Suc-eq-le)

**lemma UN-atLeast-UNIV:** (∪ m :: nat. atLeast m) = UNIV 
by blast

61.5.4 The Constant atMost

**lemma atMost-0 [simp]:** atMost (0 :: nat) = {0} 
by (simp add: atMost-def)

**lemma atMost-Suc:** atMost (Suc k) = insert (Suc k) (atMost k) 
unfolding atMost-def by (auto simp: less-Suc-eq order-le-less)

**lemma UN-atMost-UNIV:** (∪ m :: nat. atMost m) = UNIV 
by blast

61.5.5 The Constant atLeastLessThan

The orientation of the following 2 rules is tricky. The lhs is defined in terms of the rhs. Hence the chosen orientation makes sense in this theory — the reverse orientation complicates proofs (eg nontermination). But outside, when the definition of the lhs is rarely used, the opposite orientation seems preferable because it reduces a specific concept to a more general one.

**lemma atLeast0LessThan [code-abbrev]:** {0 :: nat..<n} = {..<n} 
by (simp add: lessThan-def atLeastLessThan-def)

**lemma atLeast0AtMost [code-abbrev]:** {0..n :: nat} = {..n} 
by (simp add: atMost-def atLeastAtMost-def)

**lemma lessThan-atLeast0:** {..<n} = {0 :: nat..<n} 
by (simp add: atLeast0LessThan)

**lemma atMost-atLeast0:** {..n} = {0 :: nat..n} 
by (simp add: atLeast0AtMost)

**lemma atLeastLessThan0:** {m..<0 :: nat} = {} 
by (simp add: atLeastLessThan-def)

**lemma atLeast0-lessThan-Suc:** {0..<Suc n} = insert n {0..<n} 
by (simp add: atLeast0LessThan lessThan-Suc)
THEORY “Set-Interval”

lemma atLeast0-lessThan-Suc-eq-insert-0: \{0..<\text{Suc } n\} = \text{insert } 0 \{0..<n\}
by (simp add: atLeast0LessThan lessThan-Suc-eq-insert-0)

61.5.6 The Constant atLeastAtMost

lemma Icc-eq-insert-lb-nat: \(m \leq n \Rightarrow \{m..n\} = \text{insert } m \{\text{Suc } m..n\}\)
by auto

lemma atLeast0-atMost-Suc:
\{0..\text{Suc } n\} = \text{insert } (\text{Suc } n) \{0..n\}
by (simp add: atLeast0AtMost atMost-Suc)

lemma atLeast0-atMost-Suc-eq-insert-0:
\{0..\text{Suc } n\} = \text{insert } 0 \{\text{Suc } \{0..n\}\}
by (simp add: atLeast0AtMost atMost-Suc-eq-insert-0)

61.5.7 Intervals of nats with Suc

Not a simp-rule because the RHS is too messy.

lemma atLeastLessThanSuc:
\{m..<\text{Suc } u\} = (\text{if } m \leq n \text{ then insert } n \{m..<n\} \text{ else } \{\})
by (auto simp add: atLeastLessThan-def)

lemma atLeastLessThan-singleton [simp]: \{m..<\text{Suc } m\} = \{m\}
by (auto simp add: atLeastLessThan-def)

lemma atLeastLessThan-atLeastAtMost: \{l..<\text{Suc } u\} = \{l..u\}
by (simp add: lessThan-Suc-atMost atLeastAtMost-def atLeastLessThan-def)

lemma atLeastSucAtMost-greaterThanAtMost: \{\text{Suc } l..u\} = \{l..<u\}
by (simp add: atLeast-Suc-greaterThan atLeastAtMost-def
greaterThanAtMost-def)

lemma atLeastSucLessThan-greaterThanLessThan: \{\text{Suc } l..<u\} = \{l..<u\}
by (simp add: atLeast-Suc-greaterThan atLeastLessThan-def
greaterThanLessThan-def)

lemma atLeastAtMostSuc-conv: \(m \leq \text{Suc } n \Rightarrow \{m..\text{Suc } n\} = \text{insert } (\text{Suc } n) \{m..n\}\)
by auto

lemma atLeastAtMost-insertL: \(m \leq n \Rightarrow \text{insert } m \{\text{Suc } m..n\} = \{m ..n\}\)
by auto

The analogous result is useful on int:

lemma atLeastAtMostPlus1-int-conv:
\(m \leq 1+n \Rightarrow \{m..1+n\} = \text{insert } (1+n) \{m..n::\text{int}\}\)
by (auto intro: set-eqI)
lemma atLeastLessThan-add-Un: \( i \leq j \implies \{ i..<j+k \} = \{ i..<j \} \cup \{ j..<j+k::\text{nat} \} \)
by (induct k) (simp-all add: atLeastLessThanSuc)

61.5.8 Intervals and numerals

lemma lessThan-nat-numeral: — Evaluation for specific numerals
\( \text{lessThan} (\text{numeral } k :: \text{nat}) = \text{insert} (\text{pred-numeral } k) \) (lessThan (pred-numeral k))
by (simp add: numeral-eq-Suc lessThan-Suc)

lemma atMost-nat-numeral: — Evaluation for specific numerals
\( \text{atMost} (\text{numeral } k :: \text{nat}) = \text{insert} (\text{numeral } k) \) (atMost (pred-numeral k))
by (simp add: numeral-eq-Suc atMost-Suc)

lemma atLeastLessThan-nat-numeral: — Evaluation for specific numerals
\( \text{atLeastLessThan} m (\text{numeral } k :: \text{nat}) = \)
if \( m \leq (\text{pred-numeral } k) \) then \( \text{insert} (\text{pred-numeral } k) \) (atLeastLessThan m (pred-numeral k))
else \{\}
by (simp add: numeral-eq-Suc atLeastLessThanSuc)

translations

\[ \sum x =. a..b. \ t = \text{CONST} \ \text{sum} \ (\lambda x. \ t) \ \{a..b\} \]
\[ \sum x =. a..<b. \ t = \text{CONST} \ \text{sum} \ (\lambda x. \ t) \ \{a..<b\} \]
\[ \sum i \leq n. \ t = \text{CONST} \ \text{sum} \ (\lambda i. \ t) \ \{..n\} \]
\[ \sum i < n. \ t = \text{CONST} \ \text{sum} \ (\lambda i. \ t) \ \{..<n\} \]

The above introduces some pretty alternative syntaxes for summation over intervals:
The left column shows the term before introduction of the new syntax, the middle column shows the new (default) syntax, and the right column shows a special syntax. The latter is only meaningful for latex output and has to be activated explicitly by setting the print mode to latex-sum (e.g. via `mode = latex-sum` in antiquotations). It is not the default \LaTeX output because it only works well with italic-style formulae, not tt-style.

Note that for uniformity on `nat` it is better to use $\sum x = 0..<n$. \textit{e} rather than $\sum x < n$. \textit{e}: \texttt{sum} may not provide all lemmas available for \{\texttt{m..<n}\} also in the special form for \{\texttt{..<e}\}.

This congruence rule should be used for sums over intervals as the standard theorem \texttt{sum.cong} does not work well with the simplifier who adds the unsimplified premise $x \in B$ to the context.
