Knapsack

KNAPSACK is a problem which generalises many natural scheduling and optimisation problems, and through reductions has been used to show many such problems NP-complete.

In the problem, we are given n items, each with a positive integer value v_i and weight w_i .

We are also given a maximum total weight W, and a minimum total value V.

Can we select a subset of the items whose total weight does not exceed W, and whose total value exceeds V?

Reduction

The proof that KNAPSACK is NP-complete is by a reduction from the problem of Exact Cover by 3-Sets.

Given a set $U = \{1, ..., 3n\}$ and a collection of 3-element subsets of $U, S = \{S_1, ..., S_m\}$.

We map this to an instance of KNAPSACK with m elements each corresponding to one of the S_i , and having weight and value

 $\sum_{j \in S_i} (m+1)^{j-1}$

and set the target weight and value both to

 $\sum_{j=0}^{3n-1} (m+1)^j$

Scheduling

Some examples of the kinds of scheduling tasks that have been proved NP-complete include:

Timetable Design

Given a set H of *work periods*, a set W of *workers* each with an associated subset of H (available periods), a set Tof *tasks* and an assignment $r: W \times T \to \mathbb{N}$ of *required work*, is there a mapping $f: W \times T \times H \to \{0, 1\}$ which completes all tasks?

Scheduling

Sequencing with Deadlines

Given a set T of *tasks* and for each task a *length* $l \in \mathbb{N}$, a release time $r \in \mathbb{N}$ and a deadline $d \in \mathbb{N}$, is there a work schedule which completes each task between its release time and its deadline?

Job Scheduling

Given a set T of *tasks*, a number $m \in \mathbb{N}$ of processors a length $l \in \mathbb{N}$ for each task, and an overall deadline $D \in \mathbb{N}$, is there a multi-processor schedule which completes all tasks by the deadline?

Responses to NP-Completeness

Confronted by an NP-complete problem, say constructing a timetable, what can one do?

- It's a single instance, does asymptotic complexity matter?
- What's the critical size? Is scalability important?
- Are there guaranteed restrictions on the input? Will a special purpose algorithm suffice?
- Will an approximate solution suffice? Are performance guarantees required?
- Are there useful heuristics that can constrain a search? Ways of ordering choices to control backtracking?

Validity

We define VAL—the set of *valid* Boolean expressions—to be those Boolean expressions for which every assignment of truth values to variables yields an expression equivalent to **true**.

 $\phi \in \mathsf{VAL} \quad \Leftrightarrow \quad \neg \phi \not\in \mathsf{SAT}$

By an exhaustive search algorithm similar to the one for SAT, VAL is in $\mathsf{TIME}(n^2 2^n)$.

Is $VAL \in NP$?

Validity

 $\overline{VAL} = \{ \phi \mid \phi \notin VAL \}$ —the *complement* of VAL is in NP.

Guess a a *falsifying* truth assignment and verify it.

Such an algorithm does not work for VAL.

In this case, we have to determine whether *every* truth assignment results in **true**—a requirement that does not sit as well with the definition of acceptance by a nondeterministic machine.

Complementation

If we interchange accepting and rejecting states in a deterministic machine that accepts the language L, we get one that accepts \overline{L} .

If a language $L \in \mathsf{P}$, then also $\overline{L} \in \mathsf{P}$.

Complexity classes defined in terms of nondeterministic machine models are not necessarily closed under complementation of languages.

Define,

co-NP – the languages whose complements are in NP.

Succinct Certificates

The complexity class NP can be characterised as the collection of languages of the form:

 $L = \{x \mid \exists y R(x, y)\}$

Where R is a relation on strings satisfying two key conditions

- 1. R is decidable in polynomial time.
- 2. *R* is *polynomially balanced*. That is, there is a polynomial p such that if R(x, y) and the length of x is n, then the length of y is no more than p(n).

Succinct Certificates

y is a *certificate* for the membership of x in L.

Example: If L is SAT, then for a satisfiable expression x, a certificate would be a satisfying truth assignment.
