

Lecture 8

Full Abstraction

Proof principle

For all types τ and closed terms $M_1, M_2 \in \text{PCF}_\tau$,

$$\llbracket M_1 \rrbracket = \llbracket M_2 \rrbracket \text{ in } \llbracket \tau \rrbracket \implies M_1 \cong_{\text{ctx}} M_2 : \tau .$$

Hence, to prove

$$M_1 \cong_{\text{ctx}} M_2 : \tau$$

it suffices to establish

$$\llbracket M_1 \rrbracket = \llbracket M_2 \rrbracket \text{ in } \llbracket \tau \rrbracket .$$

Full abstraction

A denotational model is said to be *fully abstract* whenever denotational equality characterises contextual equivalence.

- The domain model of PCF is *not* fully abstract.

In other words, there are contextually equivalent PCF terms with different denotations.

Failure of full abstraction, idea

We will construct two closed terms

$$T_1, T_2 \in \text{PCF}_{(bool \rightarrow (bool \rightarrow bool)) \rightarrow bool}$$

such that

$$T_1 \cong_{\text{ctx}} T_2$$

and

$$\llbracket T_1 \rrbracket \neq \llbracket T_2 \rrbracket$$

- We achieve $T_1 \cong_{\text{ctx}} T_2$ by making sure that

$$\forall M \in \text{PCF}_{\text{bool} \rightarrow (\text{bool} \rightarrow \text{bool})} (T_1 M \not\downarrow_{\text{bool}} \& T_2 M \not\downarrow_{\text{bool}})$$

Hence,

$$[\![T_1]\!](\![M]\!) = \perp = [\![T_2]\!](\![M]\!)$$

for all $M \in \text{PCF}_{\text{bool} \rightarrow (\text{bool} \rightarrow \text{bool})}$.

- We achieve $[\![T_1]\!] \neq [\![T_2]\!]$ by making sure that

$$[\![T_1]\!](por) \neq [\![T_2]\!](por)$$

for some *non-definable* continuous function

$$por \in (\mathbb{B}_\perp \rightarrow (\mathbb{B}_\perp \rightarrow \mathbb{B}_\perp)) .$$

Parallel-or function

is the unique continuous function $\text{por} : \mathbb{B}_\perp \rightarrow (\mathbb{B}_\perp \rightarrow \mathbb{B}_\perp)$ such that

$$\text{por } \text{true } \perp = \text{true}$$

$$\text{por } \perp \text{ true} = \text{true}$$

$$\text{por } \text{false } \text{false} = \text{false}$$

In which case, it necessarily follows by monotonicity that

$$\text{por } \text{true } \text{true} = \text{true} \qquad \text{por } \text{false } \perp = \perp$$

$$\text{por } \text{true } \text{false} = \text{true} \qquad \text{por } \perp \text{ false} = \perp$$

$$\text{por } \text{false } \text{true} = \text{true} \qquad \text{por } \perp \perp = \perp$$

Undefinability of parallel-or

Proposition. *There is no closed PCF term*

$$P : \text{bool} \rightarrow (\text{bool} \rightarrow \text{bool})$$

satisfying

$$\llbracket P \rrbracket = \text{por} : \mathbb{B}_\perp \rightarrow (\mathbb{B}_\perp \rightarrow \mathbb{B}_\perp) .$$

Parallel-or test functions

For $i = 1, 2$ define

$$T_i \stackrel{\text{def}}{=} \begin{aligned} & \mathbf{fn} \ f : \text{bool} \rightarrow (\text{bool} \rightarrow \text{bool}) . \\ & \quad \mathbf{if} \ (f \ \mathbf{true} \ \Omega) \ \mathbf{then} \\ & \quad \quad \mathbf{if} \ (f \ \Omega \ \mathbf{true}) \ \mathbf{then} \\ & \quad \quad \quad \mathbf{if} \ (f \ \mathbf{false} \ \mathbf{false}) \ \mathbf{then} \ \Omega \ \mathbf{else} \ B_i \\ & \quad \quad \mathbf{else} \ \Omega \\ & \quad \mathbf{else} \ \Omega \end{aligned}$$

where $B_1 \stackrel{\text{def}}{=} \mathbf{true}$, $B_2 \stackrel{\text{def}}{=} \mathbf{false}$,
and $\Omega \stackrel{\text{def}}{=} \mathbf{fix}(\mathbf{fn} \ x : \text{bool} . \ x)$.

Failure of full abstraction

Proposition.

$$T_1 \cong_{\text{ctx}} T_2 : (\text{bool} \rightarrow (\text{bool} \rightarrow \text{bool})) \rightarrow \text{bool}$$

$$\llbracket T_1 \rrbracket \neq \llbracket T_2 \rrbracket \in (\mathbb{B}_\perp \rightarrow (\mathbb{B}_\perp \rightarrow \mathbb{B}_\perp)) \rightarrow \mathbb{B}_\perp$$

PCF+por

Expressions $M ::= \dots \mid \text{por}(M, M)$

Typing
$$\frac{\Gamma \vdash M_1 : \text{bool} \quad \Gamma \vdash M_2 : \text{bool}}{\Gamma \vdash \text{por}(M_1, M_2) : \text{bool}}$$

Evaluation

$$\frac{\begin{array}{c} M_1 \Downarrow_{\text{bool}} \text{true} \\ \hline \text{por}(M_1, M_2) \Downarrow_{\text{bool}} \text{true} \end{array} \quad \begin{array}{c} M_2 \Downarrow_{\text{bool}} \text{true} \\ \hline \text{por}(M_1, M_2) \Downarrow_{\text{bool}} \text{true} \end{array}}{\begin{array}{c} M_1 \Downarrow_{\text{bool}} \text{false} \quad M_2 \Downarrow_{\text{bool}} \text{false} \\ \hline \text{por}(M_1, M_2) \Downarrow_{\text{bool}} \text{false} \end{array}}$$

Plotkin's full abstraction result

The denotational semantics of PCF+por is given by extending that of PCF with the clause

$$\llbracket \Gamma \vdash \mathbf{por}(M_1, M_2) \rrbracket(\rho) \stackrel{\text{def}}{=} \mathit{por}(\llbracket \Gamma \vdash M_1 \rrbracket(\rho))(\llbracket \Gamma \vdash M_2 \rrbracket(\rho))$$

This denotational semantics is fully abstract for contextual equivalence of PCF+por terms:

$$\Gamma \vdash M_1 \cong_{\text{ctx}} M_2 : \tau \Leftrightarrow \llbracket \Gamma \vdash M_1 \rrbracket = \llbracket \Gamma \vdash M_2 \rrbracket.$$
