Recall:

λ-Terms, M

are built up from a given, countable collection of

- variables $x, y, z, \ldots$

by two operations for forming λ-terms:

- λ-abstraction: $(\lambda x.M)$
  (where x is a variable and M is a λ-term)
- application: $(M\,M')$
  (where M and M' are λ-terms).

Some random examples of λ-terms:

$$x \quad (\lambda x.x) \quad ((\lambda y.(x\,y))x) \quad (\lambda y.((\lambda y.(x\,y))x))$$

Substitution $N[M/x]$

$$
\begin{aligned}
x[M/x] &= M \\
y[M/x] &= y \qquad \text{if } y \neq x \\
(\lambda y.N)[M/x] &= \lambda y.N[M/x] \qquad \text{if } y \# (M\ x) \\
(N_1\ N_2)[M/x] &= N_1[M/x]\ N_2[M/x]
\end{aligned}
$$

Side-condition $y \# (M\ x)$ (y does not occur in M and $y \neq x$) makes substitution "capture-avoiding".

E.g. if $x \neq y$

$$(\lambda y.x)[y/x] \neq \lambda y.y$$

Substitution $N[M/x]$

$$
\begin{aligned}
x[M/x] &= M \\
y[M/x] &= y && \text{if } y \neq x \\
(\lambda y.N)[M/x] &= \lambda y.N[M/x] && \text{if } y \# (M\ x) \\
(N_1\ N_2)[M/x] &= N_1[M/x]\ N_2[M/x]
\end{aligned}
$$

$N[M/x]$ = result of replacing all <u>free</u> occurrences of x in N with M, avoiding "capture" of free variables in M by λ-binders in N

Substitution $N[M/x]$

$$\begin{aligned}
x[M/x] &= M \\
y[M/x] &= y \qquad \text{if } y \neq x \\
(\lambda y.N)[M/x] &= \lambda y.N[M/x] \qquad \text{if } y \mathrel{\#} (M\ x) \\
(N_1\ N_2)[M/x] &= N_1[M/x]\ N_2[M/x]
\end{aligned}$$

Can always satisfy this up to α-equivalence

E.g. if $x \neq y \neq z \neq x$

$$(\lambda y.x)[y/x] =_\alpha (\lambda z.x)[y/x] = \lambda z.y$$

In fact $N \mapsto N[M/x]$ induces a totally defined function from the set of α-equivalence classes of λ-terms to itself.

$$\lambda x.(\lambda z.z)\,y\,x\,[\lambda z.y / y]$$

$=$

$$\lambda x.(\lambda z.z)\,y\,x\,[\lambda z.y/y]$$

no possible capture

$=$

$$\lambda x.\,(\lambda z.z)\,y\,x\,[\,\lambda z.y \,/\, y\,]$$

$$= \lambda x.\,(\lambda z.z)(\lambda z.y)\,x$$

$$\lambda x.\,(\lambda u.u)\,x\,y\,[\,\lambda y.x \,/\, y\,]$$

$$=$$

$$\lambda x.(\lambda z.z)\,y\,x\,[\lambda x.y/y]$$

$$= \lambda x.(\lambda z.z)(\lambda x.y)\,x$$

$$\lambda x.(\lambda u.u)\,x\,y\,[\lambda y.x/y]$$ possible capture

$$=$$

$$\lambda x. (\lambda z. z)\, y\, x \left[\lambda x. y / y \right]$$

$$= \lambda x. (\lambda z. z)(\lambda x. y)\, x$$

$$\lambda x. (\lambda u. u)\, x\, y \left[\lambda y. x / y \right]$$

possible capture...

$$=_\alpha \lambda z. (\lambda u. u)\, z\, y \left[\lambda y. x / y \right]$$

...α-convert to avoid

$$\lambda x.(\lambda z.z)\,y\,x\,[\,\lambda x.y / y\,]$$

$$= \lambda x.(\lambda z.z)(\lambda x.y)\,x$$

$$\lambda x.(\lambda u.u)\,x\,y\,[\,\lambda y.x / y\,]$$

possible capture...

$$=_\alpha \lambda z.(\lambda u.u)\,z\,y\,[\,\lambda y.x / y\,]$$

...α-convert to avoid

$$= \lambda z.(\lambda u.u)\,z\,(\lambda y.x)$$

β-Reduction

Recall that $\lambda x.M$ is intended to represent the function f such that $f(x) = M$ for all x. We can regard $\lambda x.M$ as a function on λ-terms via substitution: map each N to $M[N/x]$.

So the natural notion of computation for λ-terms is given by stepping from a

β-redex $\qquad (\lambda x.M)N$

to the corresponding

β-reduct $\qquad M[N/x]$

β-Reduction

One-step β-reduction, $M \to M'$:

$$\frac{}{(\lambda x.M)N \to M[N/x]} \qquad \frac{M \to M'}{\lambda x.M \to \lambda x.M'}$$

$$\frac{M \to M'}{M\,N \to M'\,N} \qquad \frac{M \to M'}{N\,M \to N\,M'}$$

$$\frac{N =_\alpha M \qquad M \to M' \qquad M' =_\alpha N'}{N \to N'}$$

β-Reduction

E.g.

$$(\lambda x.x\,y)((\lambda y.\lambda z.z)u) \to ((\lambda y.\lambda z.z)u)y \to (\lambda z.z)y \to y$$

$$(\lambda x.x\,y)((\lambda y.\lambda z.z)u) \to (\lambda x.x\,y)(\lambda z.z) \to (\lambda z.z)y \to y$$

β-Reduction

E.g.

$$(\lambda x.x\,y)((\lambda y.\lambda z.z)\,u) \longrightarrow ((\lambda y.\lambda z.z)\,u)\,y \longrightarrow (\lambda z.z)\,y \longrightarrow y$$

$$(\lambda x.x\,y)((\lambda y.\lambda z.z)\,u) \longrightarrow (\lambda x.x\,y)(\lambda z.z) \longrightarrow (\lambda z.z)\,y$$

β-Reduction

E.g.

$$(\lambda x.x\,y)((\lambda y.\lambda z.z)u) \longrightarrow ((\lambda y.\lambda z.z)u)y \longrightarrow (\lambda z.z)y$$

$$(\lambda x.x\,y)((\lambda y.\lambda z.z)u) \longrightarrow (\lambda x.x\,y)(\lambda z.z) \longrightarrow (\lambda z.z)y$$

$$(\lambda z.z)y \longrightarrow y$$

β-Reduction

E.g.

$$(\lambda x.x\,y)((\lambda y.\lambda z.z)u) \rightarrow ((\lambda y.\lambda z.z)u)y \rightarrow (\lambda z.z)y \rightarrow y$$

$$(\lambda x.x\,y)((\lambda y.\lambda z.z)u) \rightarrow (\lambda x.x\,y)(\lambda z.z) \rightarrow (\lambda z.z)y \rightarrow y$$

β-Reduction

E.g.

$$(\lambda x.x\,y)((\lambda y.\lambda z.z)u) \longrightarrow ((\lambda y.\lambda z.z)u)y \longrightarrow (\lambda z.z)y$$

$$(\lambda x.x\,y)((\lambda y.\lambda z.z)u) \longrightarrow (\lambda x.x\,y)(\lambda z.z) \longrightarrow (\lambda z.z)y$$

$$(\lambda z.z)y \longrightarrow y$$

β-Reduction

E.g.

$$
\begin{array}{ccccc}
 & \nearrow & ((\lambda y.\lambda z.z)u)y & \searrow & \\
(\lambda x.x\,y)((\lambda y.\lambda z.z)u) & & & & (\lambda z.z)y \longrightarrow y \\
 & \searrow & (\lambda x.x\,y)(\lambda z.z) & \nearrow &
\end{array}
$$

E.g. of "up to α-equivalence" aspect of reduction:

$$(\lambda x.\lambda y.x)y =_\alpha (\lambda x.\lambda z.x)y \to \lambda z.y$$

Many-step β-reduction, $M \twoheadrightarrow M'$:

$$\frac{M =_\alpha M'}{M \twoheadrightarrow M'} \qquad \frac{M \to M'}{M \twoheadrightarrow M'} \qquad \frac{M \twoheadrightarrow M' \qquad M' \to M''}{M \twoheadrightarrow M''}$$

(no steps) (1 step) (1 more step)

E.g.

$$(\lambda x.x\,y)((\lambda y\,z.z)u) \twoheadrightarrow y$$

$$(\lambda x.\lambda y.x)y \twoheadrightarrow \lambda z.y$$

β-Conversion $M =_\beta N$

Informally: $M =_\beta N$ holds if N can be obtained from M by performing zero or more steps of α-equivalence, β-reduction, or β-*expansion* ($=$ inverse of a reduction).

E.g. $u\,((\lambda x\,y.\,v\,x)y) =_\beta (\lambda x.\,u\,x)(\lambda x.\,v\,y)$

because $(\lambda x.\,u\,x)(\lambda x.\,v\,y) \to u(\lambda x.\,v\,y)$

and so we have

$$
\begin{array}{rcll}
u\,((\lambda x\,y.\,v\,x)y) & =_\alpha & u\,((\lambda x\,y'.\,v\,x)y) & \\
& \to & u(\lambda y'.\,v\,y) & \text{reduction} \\
& =_\alpha & u(\lambda x.\,v\,y) & \\
& \leftarrow & (\lambda x.\,u\,x)(\lambda x.\,v\,y) & \text{expansion}
\end{array}
$$

β-Conversion $M =_\beta N$

is the binary relation inductively generated by the rules:

$$\frac{M =_\alpha M'}{M =_\beta M'} \qquad \frac{M \to M'}{M =_\beta M'} \qquad \frac{M =_\beta M'}{M' =_\beta M}$$

$$\frac{M =_\beta M' \qquad M' =_\beta M''}{M =_\beta M''} \qquad \frac{M =_\beta M'}{\lambda x.M =_\beta \lambda x.M'}$$

$$\frac{M =_\beta M' \qquad N =_\beta N'}{M\,N =_\beta M'\,N'}$$

Church-Rosser Theorem

Theorem. $\twoheadrightarrow$ is confluent, that is, if $M_1 \twoheadleftarrow M \twoheadrightarrow M_2$, then there exists M' such that $M_1 \twoheadrightarrow M' \twoheadleftarrow M_2$.

[Proof omitted.]

Church-Rosser Theorem

Theorem. $\twoheadrightarrow$ is confluent, that is, if $M_1 \twoheadleftarrow M \twoheadrightarrow M_2$, then there exists M' such that $M_1 \twoheadrightarrow M' \twoheadleftarrow M_2$.

Corollary. Two show that two terms are β-convertible, it suffices to show that they both reduce to the same term. More precisely: $M_1 =_\beta M_2$ iff $\exists M\,(M_1 \twoheadrightarrow M \twoheadleftarrow M_2)$.

Church-Rosser Theorem

Theorem. $\twoheadrightarrow$ is confluent, that is, if $M_1 \twoheadleftarrow M \twoheadrightarrow M_2$, then there exists M' such that $M_1 \twoheadrightarrow M' \twoheadleftarrow M_2$.

Corollary. $M_1 =_\beta M_2$ iff $\exists M\,(M_1 \twoheadrightarrow M \twoheadleftarrow M_2)$.

Proof. $=_\beta$ satisfies the rules generating $\twoheadrightarrow$; so $M \twoheadrightarrow M'$ implies $M =_\beta M'$. Thus if $M_1 \twoheadrightarrow M \twoheadleftarrow M_2$, then $M_1 =_\beta M =_\beta M_2$ and so $M_1 =_\beta M_2$.

Conversely, the relation $\{(M_1, M_2) \mid \exists M\,(M_1 \twoheadrightarrow M \twoheadleftarrow M_2)\}$ satisfies the rules generating $=_\beta$: the only difficult case is closure of the relation under transitivity and for this we use the Church-Rosser theorem: $M_1 \longrightarrow\!\!\!\!\!\rightarrow M \leftarrow\!\!\!\!\!\longleftarrow M_2 \longrightarrow\!\!\!\!\!\rightarrow M' \leftarrow\!\!\!\!\!\longleftarrow M_3$

Church-Rosser Theorem

Theorem. $\twoheadrightarrow$ is confluent, that is, if $M_1 \twoheadleftarrow M \twoheadrightarrow M_2$, then there exists M' such that $M_1 \twoheadrightarrow M' \twoheadleftarrow M_2$.

Corollary. $M_1 =_\beta M_2$ iff $\exists M\,(M_1 \twoheadrightarrow M \twoheadleftarrow M_2)$.

Proof. $=_\beta$ satisfies the rules generating $\twoheadrightarrow$; so $M \twoheadrightarrow M'$ implies $M =_\beta M'$. Thus if $M_1 \twoheadrightarrow M \twoheadleftarrow M_2$, then $M_1 =_\beta M =_\beta M_2$ and so $M_1 =_\beta M_2$.

Conversely, the relation $\{(M_1, M_2) \mid \exists M\,(M_1 \twoheadrightarrow M \twoheadleftarrow M_2)\}$ satisfies the rules generating $=_\beta$: the only difficult case is closure of the relation under transitivity and for this we use the Church-Rosser theorem:

$$M_1 \twoheadrightarrow M \twoheadleftarrow M_2 \twoheadrightarrow M' \twoheadleftarrow M_3$$

C-R

$$M \twoheadrightarrow M_2' \twoheadleftarrow M'$$

Church-Rosser Theorem

Theorem. $\twoheadrightarrow$ is confluent, that is, if $M_1 \twoheadleftarrow M \twoheadrightarrow M_2$, then there exists M' such that $M_1 \twoheadrightarrow M' \twoheadleftarrow M_2$.

Corollary. $M_1 =_\beta M_2$ iff $\exists M\,(M_1 \twoheadrightarrow M \twoheadleftarrow M_2)$.

Proof. $=_\beta$ satisfies the rules generating $\twoheadrightarrow$; so $M \twoheadrightarrow M'$ implies $M =_\beta M'$. Thus if $M_1 \twoheadrightarrow M \twoheadleftarrow M_2$, then $M_1 =_\beta M =_\beta M_2$ and so $M_1 =_\beta M_2$.

Conversely, the relation $\{(M_1, M_2) \mid \exists M\,(M_1 \twoheadrightarrow M \twoheadleftarrow M_2)\}$ satisfies the rules generating $=_\beta$: the only difficult case is closure of the relation under transitivity and for this we use the Church-Rosser theorem. Hence $M_1 =_\beta M_2$ implies $\exists M\,(M_1 \twoheadrightarrow M' \twoheadleftarrow M_2)$.

β-Normal Forms

Definition. A λ-term N is in β-normal form (nf) if it contains no β-redexes (no sub-terms of the form $(\lambda x.M)M'$). M has β-nf N if $M =_\beta N$ with N a β-nf.

β-Normal Forms

Definition. A λ-term N is in β-normal form (nf) if it contains no β-redexes (no sub-terms of the form $(\lambda x.M)M'$). M has β-nf N if $M =_\beta N$ with N a β-nf.

Note that if N is a β-nf and $N \twoheadrightarrow N'$, then it must be that $N =_\alpha N'$ (why?).

Hence if $N_1 =_\beta N_2$ with N_1 and N_2 both β-nfs, then $N_1 =_\alpha N_2$. (For if $N_1 =_\beta N_2$, then by Church-Rosser $N_1 \twoheadrightarrow M' \twoheadleftarrow N_2$ for some M', so $N_1 =_\alpha M' =_\alpha N_2$.)

So the β-nf of M is unique up to α-equivalence if it exists.

Non-termination

Some λ terms have no β-nf.

E.g. $\Omega \triangleq (\lambda x.x\,x)(\lambda x.x\,x)$ satisfies

- $\Omega \to (x\,x)[(\lambda x.x\,x)/x] = \Omega$,
- $\Omega \twoheadrightarrow M$ implies $\Omega =_\alpha M$.

So there is no β-nf N such that $\Omega =_\beta N$.

Non-termination

Some λ terms have no β-nf.

E.g. $\Omega \triangleq (\lambda x.x\,x)(\lambda x.x\,x)$ satisfies

- $\Omega \to (x\,x)[(\lambda x.x\,x)/x] = \Omega$,
- $\Omega \twoheadrightarrow M$ implies $\Omega =_\alpha M$.

So there is no β-nf N such that $\Omega =_\beta N$.

A term can possess both a β-nf and infinite chains of reduction from it.

E.g. $(\lambda x.y)\Omega \to y$, but also $(\lambda x.y)\Omega \to (\lambda x.y)\Omega \to \cdots$.

Non-termination

Normal-order reduction is a deterministic strategy for reducing λ-terms: reduce the “left-most, outer-most” redex first.

- left-most: reduce M before N in $M\,N$, and then
- outer-most: reduce $(\lambda x.M)N$ rather than either of M or N.

(cf. call-by-name evaluation).

Fact: normal-order reduction of M always reaches the β-nf of M if it possesses one.

$$\frac{M_1 =_\alpha M_1' \quad M_1' \to_{NOR} M_2' \quad M_2' =_\alpha M_2}{M_1 \to_{NOR} M_2}$$

$$\frac{M \to_{NOR} M'}{\lambda x. M \to_{NOR} \lambda x. M'}$$

$$\frac{M_1 \to_{NOR} M_1'}{M_1 M_2 \to_{NOR} M_1' M_2}$$

$$\frac{}{(\lambda x. M) M' \to_{NOR} M[M'/x]}$$

$$\frac{M \to_{NOR} M'}{U M \to_{NOR} U M'}$$

where $\begin{cases} U ::= x \mid U N \\ N ::= \lambda x. N \mid U \end{cases}$

N: β-normal forms

U: "neutral" forms
