#### **Adequacy**

For any closed PCF terms M and V of ground type  $\gamma \in \{nat, bool\}$  with V a value

$$\llbracket M \rrbracket = \llbracket V \rrbracket \in \llbracket \gamma \rrbracket \implies M \Downarrow_{\gamma} V.$$

#### Adequacy proof idea

- 1. We cannot proceed to prove the adequacy statement by a straightforward induction on the structure of terms.
  - $\blacktriangleright$  Consider M to be  $M_1 M_2$ ,  $\mathbf{fix}(M')$ .

We cannot directly proceed by induction: In particular the adequacy statement only applies to ground types and so gives has in problem. In higher-order programs.

## Adequacy proof idea

- 1. We cannot proceed to prove the adequacy statement by a straightforward induction on the structure of terms.
  - ▶ Consider M to be  $M_1 M_2$ ,  $\mathbf{fix}(M')$ .

2. So we proceed to prove a stronger statement that applies to terms of arbitrary types and implies adequacy.

This statement roughly takes the form:

 $[\![M]\!] \lhd_\tau M$  for all types  $\tau$  and all  $M \in \mathrm{PCF}_\tau$ 

where the formal approximation relations

ephe a good family  $reg = [\tau] \times PCF_{\tau}$ 

are logically chosen to allow a proof by induction.

[My sy M => a degradey holds for M.

 $\begin{array}{ll} \mathcal{NB} & \exists_{n \ni t} = \left\{ \begin{array}{l} (\bot, M) \mid M \in \mathbb{P} \mathsf{CF}_{n \ni t} \right\} \\ & \cup \left\{ \begin{array}{l} (n, M) \mid n \in \mathbb{N} \land M \middle \text{J} \text{suce}^{h}(o) \right\} \\ & \mathbf{Definition of} \ d \vartriangleleft_{\gamma} M \ (d \in \llbracket \gamma \rrbracket, M \in \mathrm{PCF}_{\gamma}) \\ & \quad \text{for } \gamma \in \{nat, bool\} \end{array}$ 

 $\int_{n} dt \subseteq \mathbb{N}_{1} \times \mathbb{P}_{n} dt$   $n \triangleleft_{n} M \stackrel{\text{def}}{\Rightarrow} (n \in \mathbb{N} \Rightarrow M \Downarrow_{n} \mathbf{succ}^{n}(\mathbf{0}))$ 

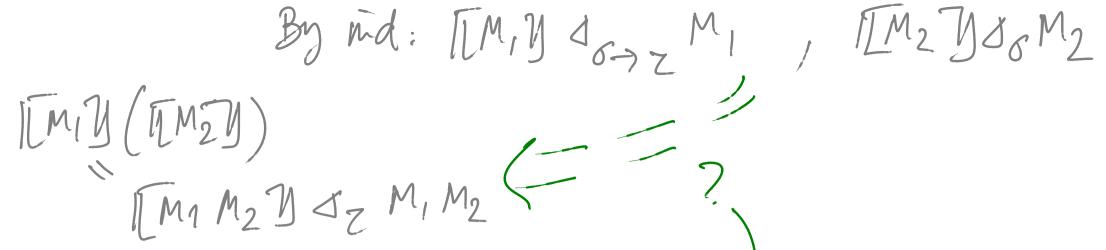

$$b \lhd_{bool} M \stackrel{\text{def}}{\Leftrightarrow} (b = true \Rightarrow M \Downarrow_{bool} \mathbf{true})$$
 &  $(b = false \Rightarrow M \Downarrow_{bool} \mathbf{false})$ 

## Proof of: $[\![M]\!] \lhd_\gamma M$ implies adequacy

Case  $\gamma = nat$ .

$$\llbracket M 
rbracket = \llbracket V 
rbracket$$
 $\implies \llbracket M 
rbracket = \llbracket \mathbf{succ}^n(\mathbf{0}) 
rbracket$  for some  $n \in \mathbb{N}$ 
 $\implies n = \llbracket M 
rbracket \lhd_{\gamma} M$ 
 $\implies M \Downarrow \mathbf{succ}^n(\mathbf{0})$  by definition of  $\lhd_{nat}$ 

Case  $\gamma = bool$  is similar.

Requirements on the formal approximation relations, II

# **Topic 8**

**Full Abstraction** 

#### **Proof principle**

For all types  $\tau$  and closed terms  $M_1, M_2 \in \mathrm{PCF}_{\tau}$ ,

$$\llbracket M_1 \rrbracket = \llbracket M_2 \rrbracket \text{ in } \llbracket \tau \rrbracket \implies M_1 \cong_{\operatorname{ctx}} M_2 : \tau .$$

Hence, to prove

$$M_1 \cong_{\operatorname{ctx}} M_2 : \tau$$

it suffices to establish

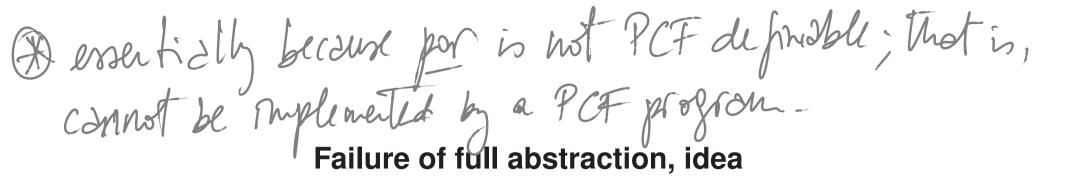

$$\llbracket M_1 
rbracket = \llbracket M_2 
rbracket$$
 in  $\llbracket au 
rbracket$  .

#### **Full abstraction**

A denotational model is said to be *fully abstract* whenever denotational equality characterises contextual equivalence.

➤ The domain model of PCF is *not* fully abstract.

In other words, there are contextually equivalent PCF terms with different denotations.

We will construct two closed terms

$$T_1, T_2 \in \mathrm{PCF}_{(bool \to (bool \to bool)) \to bool}$$

such that

$$T_1 \cong_{\operatorname{ctx}} T_2$$

and

$$[T_1] \neq [T_2] \text{ in } ((B_1 - (B_1 - B_1)) \rightarrow B_1)$$

$$[T_1] \neq [T_2] \text{ in } ((B_1 - B_1)) \rightarrow B_1)$$

$$[T_1] \neq [T_2] \text{ in } ((B_1 - B_1)) \rightarrow B_1)$$

$$[T_1] \neq [T_2] \text{ in } ((B_1 - B_1)) \rightarrow B_1)$$

$$[T_1] \neq [T_2] \text{ in } ((B_1 - B_1)) \rightarrow B_1)$$
