

Outline of today's lecture

Lecture 2: Morphology and finite state techniques

- A brief introduction to morphology

- Using morphology in NLP

- Aspects of morphological processing

- Finite state techniques

- More applications for finite state techniques

Stems and affixes

- ▶ **morpheme**: the minimal information carrying unit
- ▶ **affix**: morpheme which only occurs in conjunction with other morphemes
- ▶ words made up of **stem** (more than one for compounds) and zero or more affixes.
e.g., *dog+s*, *book+shop+s*
- ▶ *slither*, *slide*, *slip* etc have somewhat similar meanings, but *sl-* not a morpheme.

Affixation

- ▶ suffix: *dog +s*, *truth +ful*
- ▶ prefix: *un+ wise* (derivational only)
- ▶ infix: *sang* (stem *sing*): not **productive**
e.g., (maybe) *absobloodylutely*
- ▶ circumfix: not in English
German *ge+kauf+t* (stem *kauf*, affix *ge-t*)

Productivity

productivity: whether affix applies generally, whether it applies to new words

sing, sang, sung

ring, rang, rung

BUT: *ping, pinged, pinged*

So this infixation pattern is not productive:

sing, ring are **irregular**

Productivity

productivity: whether affix applies generally, whether it applies to new words

sing, sang, sung

ring, rang, rung

BUT: *ping, pinged, pinged*

So this infixation pattern is not productive:

sing, ring are **irregular**

Inflectional morphology

- ▶ e.g., plural suffix +s, past participle +ed
- ▶ sets slots in some **paradigm**
e.g., tense, aspect, number, person, gender, case
- ▶ inflectional affixes are not combined in English
- ▶ generally fully productive (modulo irregular forms)

Derivational morphology

- ▶ e.g., *un-*, *re-*, *anti-*, *-ism*, *-ist* etc
- ▶ broad range of semantic possibilities, may change part of speech
- ▶ indefinite combinations
e.g., *antiantidisestablishmentarianism*
anti-anti-dis-establish-ment-arian-ism
- ▶ generally semi-productive: e.g., *escapee*, *textee*, *?dropee*, *?snoree*, **cricketee* (* and ?)
- ▶ zero-derivation: e.g. *tango*, *waltz*

Internal structure and ambiguity

Morpheme ambiguity: stems and affixes may be individually ambiguous: e.g. *dog* (noun or verb), *+s* (plural or 3persg-verb)

Structural ambiguity: e.g., *shorts* or *short -s*

unionised could be *union -ise -ed* or *un- ion -ise -ed*

Bracketing: *un- ion -ise -ed*

- ▶ *un- ion* is not a possible form, so not *((un- ion) -ise) -ed*
- ▶ *un-* is ambiguous:
 - ▶ with verbs: means 'reversal' (e.g., *untie*)
 - ▶ with adjectives: means 'not' (e.g., *unwise*, *unsurprised*)
- ▶ therefore *(un- ((ion -ise) -ed))*

Using morphological processing in NLP

- ▶ compiling a **full-form** lexicon
 - ▶ **stemming** for IR (not linguistic stem)
 - ▶ **lemmatization** (often inflections only): finding stems and affixes as a precursor to parsing
 - ▶ generation
- Morphological processing may be **bidirectional**: i.e., parsing and generation.

party + PLURAL <-> parties

sleep + PAST_VERB <-> slept

Morphological processing

1. Surface mapped to stem(s) and affixes (or abstractions of affixes):

OPTION 1 *pinged* / *ping-ed*

OPTION 2 *pinged* / *ping* PAST_VERB

pinged / *ping* PSP_VERB

sang / *sing* PAST_VERB

sung / *sing* PSP_VERB

2. Internal structure / bracketing (e.g., (*un-* ((*ion* -*ise*) -*ed*)).
3. Syntactic and semantic effects (lecture 5)
parsing can filter results of previous stages.
e.g., *feed* analysed as *fee-ed* (as well as *feed*)

Spelling rules

- ▶ English morphology is essentially concatenative
- ▶ irregular morphology — inflectional forms have to be listed
- ▶ regular phonological and spelling changes associated with affixation, e.g.
 - ▶ -s is pronounced differently with stem ending in s, x or z
 - ▶ spelling reflects this with the addition of an e (*boxes* etc)
- ▶ in English, description is independent of particular stems/affixes

e-insertion

e.g. *box*^s to *boxes*

$$\varepsilon \rightarrow \mathbf{e} / \left\{ \begin{array}{c} \mathbf{s} \\ \mathbf{x} \\ \mathbf{z} \end{array} \right\} \wedge _ \mathbf{s}$$

- ▶ map ‘underlying’ form to surface form
- ▶ mapping is left of the slash, context to the right
- ▶ notation:

—	position of mapping
ε	empty string
^	affix boundary — stem ^ affix

- ▶ same rule for plural and 3sg verb
- ▶ formalisable/implementable as a finite state transducer

e-insertion

e.g. *box*^s to *boxes*

$$\varepsilon \rightarrow \mathbf{e} / \left\{ \begin{array}{c} \mathbf{s} \\ \mathbf{x} \\ \mathbf{z} \end{array} \right\} \wedge _ \mathbf{s}$$

- ▶ map ‘underlying’ form to surface form
- ▶ mapping is left of the slash, context to the right
- ▶ notation:

—	position of mapping
ε	empty string
^	affix boundary — stem ^ affix

- ▶ same rule for plural and 3sg verb
- ▶ formalisable/implementable as a finite state transducer

e-insertion

e.g. *box*^s to *boxes*

$$\varepsilon \rightarrow \mathbf{e} / \left\{ \begin{array}{c} \mathbf{s} \\ \mathbf{x} \\ \mathbf{z} \end{array} \right\} \wedge _ \mathbf{s}$$

- ▶ map ‘underlying’ form to surface form
- ▶ mapping is left of the slash, context to the right
- ▶ notation:

— position of mapping
 ε empty string
 \wedge affix boundary — stem \wedge affix

- ▶ same rule for plural and 3sg verb
- ▶ formalisable/implementable as a finite state transducer

Lexical requirements for morphological processing

- ▶ affixes, plus the associated information conveyed by the affix

ed PAST_VERB

ed PSP_VERB

s PLURAL_NOUN

- ▶ irregular forms, with associated information similar to that for affixes

began PAST_VERB begin

begun PSP_VERB begin

- ▶ stems with syntactic categories (plus more)

Finite state automata for recognition

day/month pairs:

- ▶ non-deterministic — after input of '2', in state 2 and state 3.
- ▶ double circle indicates accept state
- ▶ accepts e.g., 11/3 and 3/12
- ▶ also accepts 37/00 — overgeneration

Recursive FSA

comma-separated list of day/month pairs:

- ▶ list of indefinite length
- ▶ e.g., 11/3, 5/6, 12/04

e-insertion

e.g. box^s to *boxes*

$$\varepsilon \rightarrow \text{e} / \left\{ \begin{array}{c} \text{s} \\ \text{x} \\ \text{z} \end{array} \right\} ^ _ \text{s}$$

- ▶ map ‘underlying’ form to surface form
- ▶ mapping is left of the slash, context to the right
- ▶ notation:

—	position of mapping
ε	empty string
^	affix boundary — stem ^ affix

Finite state transducer

Analysing *b o x e s*

Analysing *b o x e s*

Input: b
Output: b
(Plus: $\epsilon . ^$)

Analysing *b o x e s*

Analysing *b o x e s*

Analysing *b o x e s*

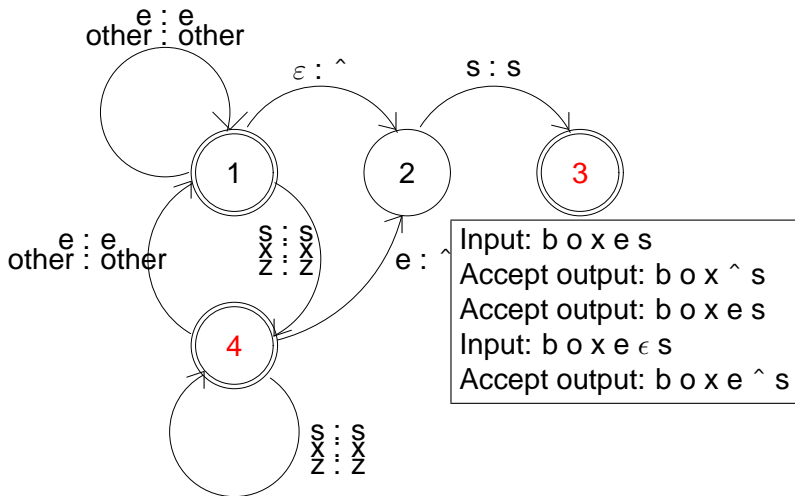

Analysing *b o x e* ϵ *s*

Analysing *b o x e s*

Analysing *b o x e s*

Using FSTs

- ▶ FSTs assume **tokenization** (word boundaries) and words split into characters. One character pair per transition!
- ▶ Analysis: return character list with affix boundaries, so enabling lexical lookup.
- ▶ Generation: input comes from stem and affix lexicons.
- ▶ One FST per spelling rule: either compile to big FST or run in parallel.
- ▶ FSTs do not allow for internal structure:
 - ▶ can't model *un- ion -ize -d* bracketing.
 - ▶ can't condition on prior transitions, so potential redundancy

Some other uses of finite state techniques in NLP

- ▶ Grammars for simple spoken dialogue systems (directly written or compiled)
- ▶ Partial grammars for named entity recognition
- ▶ Dialogue models for spoken dialogue systems (SDS)
e.g. obtaining a date:
 1. No information. System prompts for month and day.
 2. Month only is known. System prompts for day.
 3. Day only is known. System prompts for month.
 4. Month and day known.

Example FSA for dialogue

Example of probabilistic FSA for dialogue
