

## Outline of today's lecture

### Lecture 2: Morphology and finite state techniques

A brief introduction to morphology

Using morphology in NLP

Aspects of morphological processing

Finite state techniques

More applications for finite state techniques

## Stems and affixes

- ▶ **morpheme**: the minimal information carrying unit
- ▶ **affix**: morpheme which only occurs in conjunction with other morphemes
- ▶ words made up of **stem** (more than one for compounds) and zero or more affixes.  
e.g., *dog+s*, *book+shop+s*
- ▶ *slither*, *slide*, *slip* etc have somewhat similar meanings, but *sl-* not a morpheme.

# Affixation

- ▶ **suffix:** *dog +s, truth +ful*
- ▶ **prefix:** *un+ wise* (derivational only)
- ▶ **infix:** Arabic stem *k\_t\_b*: *kataba* (he wrote); *kotob* (books)  
In English: *sang* (stem *sing*): not **productive**  
e.g., (maybe) *absobloodylutely*
- ▶ **circumfix:** not in English  
German *ge+kauf+t* (stem *kauf*, affix *ge-t*)

## Productivity

**productivity**: whether affix applies generally, whether it applies to new words

*sing, sang, sung*

*ring, rang, rung*

BUT: *ping, pinged, pinged*

So this infixation pattern is not productive:

*sing, ring* are **irregular**

## Productivity

**productivity**: whether affix applies generally, whether it applies to new words

*sing, sang, sung*

*ring, rang, rung*

BUT: *ping, pinged, pinged*

So this infixation pattern is not productive:

*sing, ring* are **irregular**

## Inflectional morphology

- ▶ e.g., plural suffix *+s*, past participle *+ed*
- ▶ sets slots in some **paradigm**  
e.g., tense, aspect, number, person, gender, case
- ▶ inflectional affixes are not combined in English
- ▶ generally fully productive (modulo irregular forms)

## Derivational morphology

- ▶ e.g., *un-*, *re-*, *anti-*, *-ism*, *-ist* etc
- ▶ broad range of semantic possibilities, may change part of speech
- ▶ indefinite combinations  
e.g., *antiantidisestablishmentarianism*  
*anti-anti-dis-establish-ment-arian-ism*
- ▶ generally semi-productive: e.g., *escapee*, *textee*, *?dropee*, *?snoree*, *\*cricketee* (\* and ?)
- ▶ zero-derivation: e.g. *tango*, *waltz*

## Internal structure and ambiguity

**Morpheme ambiguity:** stems and affixes may be individually ambiguous: e.g. *dog* (noun or verb), *+s* (plural or 3persg-verb)

**Structural ambiguity:** e.g., *shorts* or *short -s*

*unionised* could be *union -ise -ed* or *un- ion -ise -ed*

**Bracketing:** *un- ion -ise -ed*

- ▶ *un- ion* is not a possible form, so not *((un- ion) -ise) -ed*
- ▶ *un-* is ambiguous:
  - ▶ with verbs: means 'reversal' (e.g., *untie*)
  - ▶ with adjectives: means 'not' (e.g., *unwise, unsurprised*)
- ▶ therefore *(un- ((ion -ise) -ed))*

## Using morphological processing in NLP

- ▶ compiling a **full-form** lexicon
- ▶ **stemming** for IR (not linguistic stem)
- ▶ **lemmatization** (often inflections only): finding stems and affixes as a precursor to parsing
- ▶ generation

Morphological processing may be **bidirectional**: i.e., parsing and generation.

party + PLURAL <-> parties

sleep + PAST\_VERB <-> slept

## Using morphological processing in NLP

**run**  
**runs**  
**ran**  
**running**

## Using morphological processing in NLP

## Using morphological processing in NLP

- ▶ compiling a **full-form** lexicon
- ▶ **stemming** for IR (not linguistic stem)
- ▶ **lemmatization** (often inflections only): finding stems and affixes as a precursor to parsing
- ▶ generation

Morphological processing may be **bidirectional**: i.e., parsing and generation.

party + PLURAL <-> parties

sleep + PAST\_VERB <-> slept

## Morphological processing

1. Surface mapped to stem(s) and affixes (or abstractions of affixes):

OPTION 1    *pinged* / *ping-ed*

OPTION 2    *pinged* / *ping* PAST\_VERB

*pinged* / *ping* PSP\_VERB

*sang* / *sing* PAST\_VERB

*sung* / *sing* PSP\_VERB

2. Internal structure / bracketing (e.g., (*un-* ((*ion* *-ise*) *-ed*)).
3. Syntactic and semantic effects (lecture 5)  
parsing can filter results of previous stages.  
e.g., *feed* analysed as *fee-ed* (as well as *feed*)

## Spelling rules

- ▶ English morphology is essentially concatenative
- ▶ irregular morphology — inflectional forms have to be listed
- ▶ regular phonological and spelling changes associated with affixation, e.g.
  - ▶ -s is pronounced differently with stem ending in s, x or z
  - ▶ spelling reflects this with the addition of an *e* (*boxes* etc)
- ▶ in English, description is independent of particular stems/affixes

## e-insertion

e.g.  $box^s$  to  $boxes$

$$\varepsilon \rightarrow e / \left\{ \begin{array}{c} s \\ x \\ z \end{array} \right\} \_ s$$

- ▶ map 'underlying' form to surface form
- ▶ mapping is left of the slash, context to the right
- ▶ notation:

\_                    position of mapping  
 $\varepsilon$                   empty string  
 ^                    affix boundary — stem ^ affix

- ▶ same rule for plural and 3sg verb
- ▶ formalisable/implementable as a finite state transducer

## e-insertion

e.g.  $box^{\wedge}s$  to  $boxes$

$$\varepsilon \rightarrow e / \left\{ \begin{array}{c} s \\ x \\ z \end{array} \right\}^{\wedge} \_ s$$

- ▶ map ‘underlying’ form to surface form
- ▶ mapping is left of the slash, context to the right
- ▶ notation:

\_                    position of mapping  
 $\varepsilon$                   empty string  
 $\wedge$                     affix boundary — stem  $\wedge$  affix

- ▶ same rule for plural and 3sg verb
- ▶ formalisable/implementable as a finite state transducer

## e-insertion

e.g.  $box^{\wedge}s$  to  $boxes$

$$\varepsilon \rightarrow e / \left\{ \begin{array}{c} s \\ x \\ z \end{array} \right\}^{\wedge} \_ s$$

- ▶ map ‘underlying’ form to surface form
- ▶ mapping is left of the slash, context to the right
- ▶ notation:

\_                    position of mapping  
 $\varepsilon$                   empty string  
 $\wedge$                     affix boundary — stem  $\wedge$  affix

- ▶ same rule for plural and 3sg verb
- ▶ formalisable/implementable as a finite state transducer

## Lexical requirements for morphological processing

- ▶ affixes, plus the associated information conveyed by the affix

ed PAST\_VERB

ed PSP\_VERB

s PLURAL\_NOUN

- ▶ irregular forms, with associated information similar to that for affixes

began PAST\_VERB begin

begun PSP\_VERB begin

- ▶ stems with syntactic categories

## Finite state automata for recognition

day/month pairs:

- ▶ non-deterministic — after input of '2', in state 2 and state 3.
- ▶ double circle indicates accept state
- ▶ accepts e.g., 11/3 and 3/12
- ▶ also accepts 37/00 — overgeneration

## Recursive FSA

comma-separated list of day/month pairs:

- ▶ list of indefinite length
- ▶ e.g., 11/3, 5/6, 12/04

## e-insertion

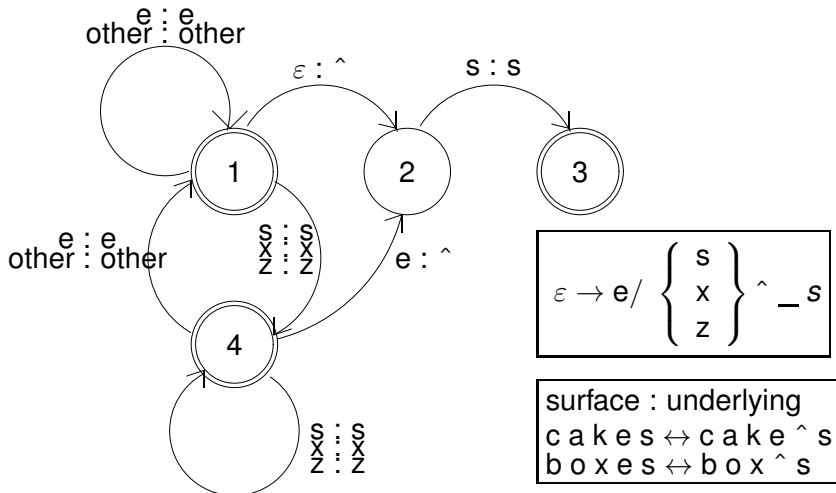

e.g. *box*^s to *boxes*

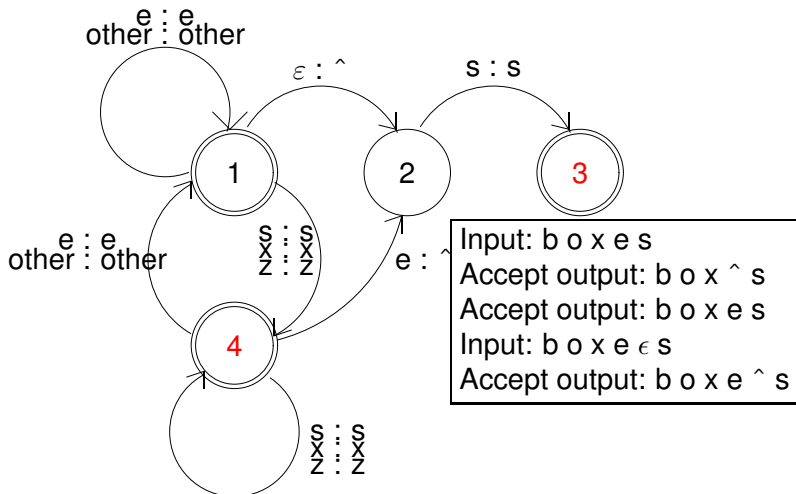

$$\varepsilon \rightarrow \mathbf{e} / \left\{ \begin{array}{c} \mathbf{s} \\ \mathbf{x} \\ \mathbf{z} \end{array} \right\} \wedge \_ \mathbf{s}$$

- ▶ map 'underlying' form to surface form
- ▶ mapping is left of the slash, context to the right
- ▶ notation:

—            position of mapping  
 ε            empty string  
 ^            affix boundary — stem ^ affix

## Finite state transducer

Analysing *b o x e s*

## Using FSTs

- ▶ FSTs assume **tokenization** (word boundaries) and words split into characters. One character pair per transition!
- ▶ Analysis: return character list with affix boundaries, so enabling lexical lookup.
- ▶ Generation: input comes from stem and affix lexicons.
- ▶ One FST per spelling rule: either compile to big FST or run in parallel.
- ▶ FSTs do not allow for internal structure:
  - ▶ can't model *un- ion -ize -d* bracketing.
  - ▶ can't condition on prior transitions, so potential redundancy

## Some other uses of finite state techniques in NLP

Dialogue models for spoken dialogue systems (SDS)

e.g. obtaining a date:

1. No information. System prompts for month and day.
2. Month only is known. System prompts for day.
3. Day only is known. System prompts for month.
4. Month and day known.

## Example FSA for dialogue

## Example of probabilistic FSA for dialogue
