

# Kernels and Tracing

L41 Lecture 2

Dr Robert N. M. Watson

27 October 2016

## Reminder: last time

- What is an operating system?
- Systems research
- About the module
- Lab reports

## This time: Tracing the kernel

- DTrace
- The **probe effect**
- The kernel: Just a C program?
- A little on kernel dynamics: How work happens

L41 Lecture 2 - Kernels and Tracing

3

## Dynamic tracing with DTrace

- Bryan M. Cantrill, Michael W. Shapiro, and Adam H. Leventhal. *Dynamic Instrumentation of Production Systems*, USENIX ATC 2004.
  - “Facility for dynamic instrumentation of production systems”
  - Unified and safe **instrumentation** of kernel and user space
  - Zero **probe effect** when not enabled
  - Dozens if **providers** representing different trace sources
  - Tens (hundreds?) of thousands of **instrumentation probes**
  - **D language**: C-like scripting language with **predicates, actions**
  - Scalar variables, thread-local variables, associative arrays
  - **Data aggregation** and **speculative tracing**
- Solaris, Mac OS X, FreeBSD; Linux + Windows modules
- Influence on other systems, such as Linux SystemTap
- **Our tool of choice in this course**

L41 Lecture 2 - Kernels and Tracing

4

## DTrace scripts

- Human-facing, C-like **D Language**
- One or more {**probe name**, **predication**, **action**} tuples
- Expression limited to control side effects (e.g., no loops)
- Specified on command line or via a .d file

<b>Probe name</b>	Identifies the probe(s) to instrument; wildcards allowed; identifies the provider and provider-specific probe name
<b>Predicate</b>	Filters cases where action will execute
<b>Action</b>	Describes tracing operations

```
fbt::malloc:entry /execname == "csh"/ { trace(arg0); }
```

Probe name              Predicate              Action

L41 Lecture 2 - Kernels and Tracing

5

## D Intermediate Format (DIF)

```
# dtrace -Sn
'fbt::malloc:entry /execname == "csh"/ { trace(arg0); }'
```

Predicate

```
DIFO 0x0x8047d2320 returns D type (integer) (size 4)
OFF OPCODE      INSTRUCTION
00: 29011801    ldgs DT_VAR(280), %r1          ! DT_VAR(280) = "execname"
01: 26000102    sets DT_STRING[1], %r2          ! "csh"
02: 27010200    scmp %r1, %r2
03: 12000006    be   6
04: 0e000001    mov  %r0, %r1
05: 11000007    ba   7
06: 25000001    setx DT_INTEGER[0], %r1          ! 0x1
07: 23000001    ret  %r1

NAME      ID  KND SCP FLAG TYPE
execname  118 scl glb r  string (unknown) by ref (size 256)
```

Action

```
DIFO 0x0x8047d2390 returns D type (integer) (size 8)
OFF OPCODE      INSTRUCTION
00: 29010601    ldgs DT_VAR(262), %r1          ! DT_VAR(262) = "arg0"
01: 23000001    ret  %r1

NAME      ID  KND SCP FLAG TYPE
arg0     106 scl glb r  D type (integer) (size 8)
```

L41 Lecture 2 - Kernels and Tracing

6

## Some FreeBSD DTrace providers

- Providers represent data sources – instrumentation types:

Provider	Description
callout_execute	Timer-driven “callout” event probes
dmalloc	Kernel malloc()/free()
dtrace	DTrace script events (BEGIN, END)
fbt	Function Boundary Tracing (function prologues, epilogues)
io	Block I/O read/write
ip,udp,tcp,sctp	TCP/IP events
lockstat	Kernel locking primitives
proc,sched	Kernel process, scheduling primitives
profile	Profiling timers
syscall	System-call entry/return
vfs	Virtual File System operations

- Apparent duplication: FBT vs. event-class providers?
  - Efficiency, expressivity, interface stability, portability

L41 Lecture 2 - Kernels and Tracing

7

## Tracing kernel malloc() calls

- Trace first argument to kernel malloc() for csh
- NB: Captures both successful and failed allocations

```
# dtrace -n
'fbt::malloc:entry /execname=="csh"/ { trace(arg0); }'
```

Probe	Use FBT to instrument malloc() function prologue
Predicate	Limit actions to processes executing csh
Action	Trace the first argument (arg0)

CPU	ID	FUNCTION:NAME	
0	8408	malloc:entry	64
0	8408	malloc:entry	2748
0	8408	malloc:entry	48
0	8408	malloc:entry	392

L41 Lecture 2 - Kernels and Tracing

8

## Aggregations – summarising traces

- **Aggregations** allow early, efficient reduction
  - Scalable multicore implementations (i.e., commutative)

```
@variable = function(.. args ..);
printa(@variable)
```

Aggregation	Description
count()	Number of times called
sum()	Sum of arguments
avg()	Average of arguments
min()	Minimum of arguments
max()	Maximum of arguments
stddev()	Standard deviation of arguments
lquantize()	Linear frequency distribution (histogram)
quantize()	Log frequency distribution (histogram)

L41 Lecture 2 - Kernels and Tracing

9

## Profiling kernel malloc() calls by csh

```
fbt::malloc:entry
/execname=="csh"/
{ @traces[stack()] = count(); }
```

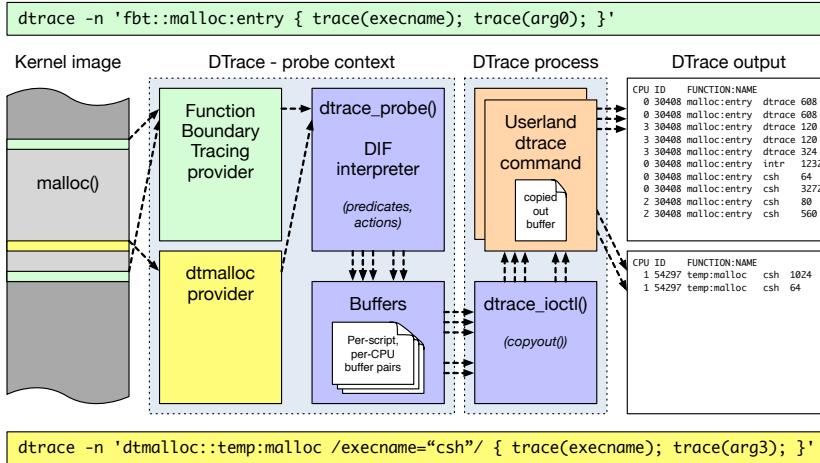

<b>Probe</b>	Use FBT to instrument malloc() function prologue
<b>Predicate</b>	Limit actions to processes executing csh
<b>Action</b>	Keys of associative array are stack traces (stack()); values are aggregated counters (count())

```
^C
kernel`malloc
kernel`fork1+0x14b4
kernel`sys_vfork+0x2c
kernel`swi_handler+0x6a8
kernel`swi_exit
kernel`swi_exit
3
...
```

L41 Lecture 2 - Kernels and Tracing

10

## DTrace: Implementation

L41 Lecture 2 - Kernels and Tracing

11

## The Probe Effect

- The **probe effect** is the unintended alteration of system behaviour that arises from measurement
  - Software instrumentation is **active**: execution is changed
- DTrace minimises probe effect when not being used...
  - ... but has a very significant impact when it is used
  - Disproportionate effect on probed events
- Potential perturbations:
  - Speed relative to other cores (e.g., lock hold times)
  - Speed relative to external events (e.g., timer ticks)
  - Microarchitectural effects (e.g., cache, branch predictor)
- What does this mean for us?
  - Don't benchmark while running Dtrace ...
  - ... unless **measuring probe effect**
  - Be aware that traced applications may behave differently
  - E.g., more timer ticks will fire, I/O will "seem faster"

L41 Lecture 2 - Kernels and Tracing

12

## Probe effect example: dd(1) execution time

- Simple (naïve) microbenchmark – dd (1)
  - dd copies blocks from input to output
  - Copy 10M buffer from /dev/zero to /dev/null
  - Execution time measured with /usr/bin/time
- Simultaneously, run various DTrace scripts
  - Compare resulting execution times using ministat
  - Difference is probe effect (+/- measurement error)

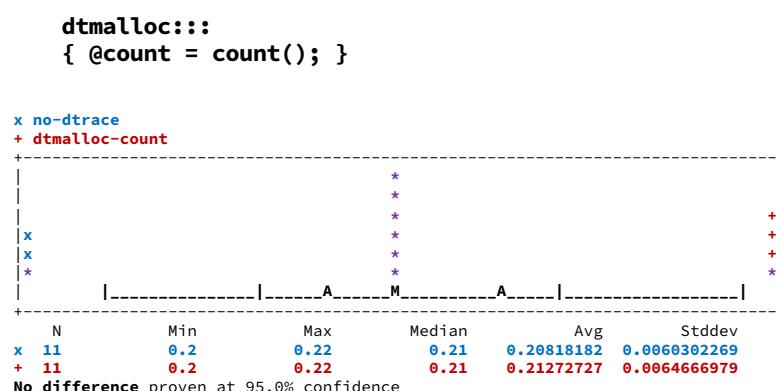

```
# dd if=/dev/zero of=/dev/null bs=10m count=1 status=none
```

L41 Lecture 2 - Kernels and Tracing

13

## Probe effect 1: memory allocation

- Using the dtmalloc provider, count kernel memory allocations:

- No statistically significant overhead at 95% confidence level

L41 Lecture 2 - Kernels and Tracing

14

## Probe effect 2: locking

- Using the lockstat provider, track kernel lock acquire, release:

```
lockstat:::
{ @count = count(); }

x no-dtrace
+ lockstat-count
+-----+
| x
| x
| x
| x x
| x x
| x x x
| |-A|-I
+-----+
      N      Min      Max      Median      Avg      Stddev
x 11    0.2     0.22     0.21   0.20818182  0.0060302269
+ 11    0.42    0.44     0.44   0.43454545  0.0068755165
Difference at 95.0% confidence
  0.226364 +/- 0.00575196
  108.734% +/- 2.76295%
  (Student's t, pooled s = 0.0064667)
```

- 109% overhead – 170K locking operations vs. 6 malloc() calls!

L41 Lecture 2 - Kernels and Tracing

15

## Probe effect 3: limiting to dd(1)?

- Limit the action to processes with the name dd:

```
lockstat::: /execname == "dd"/
{ @count = count(); }

x no-dtrace
+ lockstat-count-dd
+-----+
| x
| x
| x
| x
| x
| x x
| x x
| x x x
| |-A|
+-----+
      N      Min      Max      Median      Avg      Stddev
x 11    0.2     0.22     0.21   0.20818182  0.0060302269
+ 11    0.54    0.57     0.56   0.55818182  0.0075075719
Difference at 95.0% confidence
  0.35 +/- 0.0060565
  168.122% +/- 2.90924%
  (Student's t, pooled s = 0.00680908)
```

- Well, crumbs. Now 168% overhead!

L41 Lecture 2 - Kernels and Tracing

16

## Probe effect 4: stack traces

- Gather more locking information in action – capture call stacks:

```

lockstat::: { @stacks[stack()] = count(); }
lockstat::: /execname == "dd"/ { @stacks[stack()] = count(); }

x no-dtrace
+ lockstat-stack
* lockstat-stack-dd
+
| |
| |
| xx
| xx
| xx
| AM
+
N      Min      Max      Median     Avg      Stddev
x 11    0.2     0.22     0.21    0.20818182  0.0060302269
+ 11    1.38    1.57     1.44    1.4618182   0.058449668
               1.25364 +/- 0.0369572
               602.183% +/- 17.7524%
* 11    1.5     1.55     1.51    1.5127273   0.014206273
               1.30455 +/- 0.00970671
               626.638% +/- 4.66261%

```

L41 Lecture 2 - Kernels and Tracing

17

## The kernel: “Just a C program”?

- I claimed that the kernel was mostly “just a C program”
- This is indeed mostly true, especially in higher-level subsystems

Userspace	Kernel
crt/csu	locore
rtld	Kernel linker
Shared objects	Kernel modules
main()	main(), platform_start()
libc	libkern
POSIX threads API	kthread API
POSIX filesystem API	VFS KPI
POSIX sockets API	socket KPI
DTrace	DTrace
...	...

L41 Lecture 2 - Kernels and Tracing

18

## The kernel: not just *any* C program

- **Core kernel:** ≈3.4M LoC in ≈6,450 files
  - **Kernel runtime:** Run-time linker, object model, scheduler, memory allocator, threads, debugger, tracing, I/O routines, timekeeping
  - **Base kernel:** VM, process model, IPC, VFS w/20+ filesystems, network stack (IPv4/IPv6, 802.11, ATM, ...), crypto framework
  - Includes roughly ≈70K lines of assembly over ≈6 architectures
- Alternative C runtime – e.g., SYSINIT, curthread
- Highly concurrent – really very, very concurrent
- Virtual memory makes pointers .. odd
- Debugging features – e.g., WITNESS lock-order verifier
- **Device drivers:** ≈3.0M LoC in ≈3,500 files
  - 415 device drivers (may support multiple devices)

L41 Lecture 2 - Kernels and Tracing

19

## Spelunking the kernel

```
% ls
Makefile          ddb/           mips/          nfs/           sys/
amd64/           dev/           modules/       nfscclient/    taken/
arm/             fs/            net/           nfsserver/    tools/
boot/            gdb/           net80211/     nlm/          ufs/
bsm/              geom/          netgraph/     ofed/         vm/
cam/              gnu/           netinet/     opencrypto/   x86/
cddl/             i386/          netinet6/    pc98/        xdr/
compat/           isa/           netipsec/    powerpc/     xen/
conf/             kern/          netnatm/     rpc/
contrib/          kgssapi/       netpfifl/    security/
crypto/           libkern/       netsmb/     sparc64/
...
```

- Kernel source lives in /usr/src/sys:
  - kern/ – core kernel features
  - sys/ – core kernel headers
- Useful resource: <http://fxr.watson.org/>

L41 Lecture 2 - Kernels and Tracing

20

## How work happens in the kernel

- Kernel code executes concurrently in multiple threads
  - User threads in the kernel (e.g., a system call)
  - Shared worker threads (e.g., callouts)
  - Subsystem worker threads (e.g., network-stack workers)
  - Interrupt threads (e.g., Ethernet interrupt handling)
  - Idle threads

```
# proctstat -at
  PID   TID COMM          TDNAME        CPU PRI STATE WCHAN
  0 100000 kernel        swapper       -1 84 sleep swapin
  0 100006 kernel        dtrace_taskq -1 84 sleep -
...
  10 100002 idle         -             -1 255 run  -
  11 100003 intr         swi3: vm      0   36 wait  -
  11 100004 intr         swi4: clock (0) -1   40 wait  -
  11 100005 intr         swi1: netisr 0 -1   28 wait  -
...
  11 100018 intr         intr16: ti_adc0 0   20 wait  -
  11 100019 intr         intr91: ti_wdt0 0   20 wait  -
  11 100020 intr         swi0: uart    -1   24 wait  -
...
  739 100064 login       -             -1 108 sleep  wait
  740 100079 csh         -             -1 140 sleep  ttyin
  751 100089 proctstat  -             0   140 run   -

```

L41 Lecture 2 - Kernels and Tracing

21

## Work processing and distribution

- Many operations begin with system calls in a user thread
- But may trigger work in many other threads; for example:
  - Triggering a callback in an interrupt thread when I/O is complete
  - Eventually writing back data to disk from the buffer cache
  - Delayed transmission if TCP isn't able to send immediately
- We will need to be careful about these things, as not all work we are analysing will be in the obvious user thread
- Multiple mechanisms provide this asynchrony; e.g.:

<b>callout</b>	Closure called after wall-clock delay
<b>eventhandler</b>	Closure called for key global events
<b>task</b>	Closure called .. eventually
<b>SYSINIT</b>	Function called when module loads/unloads

\* Where *closer* in C means: function pointer, opaque data pointer

L41 Lecture 2 - Kernels and Tracing

22

## For next time

- Read Ellard and Seltzer, *NFS Tricks and Benchmarking Traps*
- Skim the handout, *L41: DTrace Quick Start*
- Be prepared to try out DTrace on a real system
