What is MATLAB

- high-level language (garbage collecting, var-len structures)
- ▶ BASIC-like syntax, with elements from C, GUI IDE
- ▶ basic data type: 2- or 3-dimensional floating-point matrix
- ▶ most operators and functions work on entire matrices
 ⇒ hardly ever necessary to write out loops
- uses internally highly optimized numerics libraries (BLAS, LAPACK, FFTW)
- comprehensive toolboxes for easy access to standard algorithms from many fields: statistics, machine learning, image processing, signal processing, neural networks, wavelets, communications systems
- very simple I/O for many data/multimedia file formats
- popular for experimental/rapid-prototype number crunching
- widely used as a visualization and teaching tool

What MATLAB is not

- not a computer algebra system
- not a strong general purpose programming language
 - limited support for other data structures
 - few software-engineering features;
 typical MATLAB programs are only a few lines long
 - not well-suited for teaching OOP
 - limited GUI features
- not a high-performance language (but fast matrix operators) got better since introduction of JIT compiler (JVM)
- not freely available (but local campus licence)

Open-source MATLAB alternatives

Similar to MATLAB, or largely compatible:

- GNU Octave
- SciLab
- FreeMat

Other high-level languages for technical computing:

- ► R focus on statistics and plotting https://www.r-project.org/
- Python a full-featured programming language. Modules:
 - numpy numerical arrays, fast linear algebra
 - matplotlib MATLAB-like plotting functions http://matplotlib.org/
- ► Julia modern, fast, full-featured, compiled, interactive language http://julialang.org/
- SciLua Scientific computing with LuaJIT http://scilua.org/

Jupyter is a popular browser-based notebook environment for recording and presenting experiments in Julia, Python, R, . . .

Local availability

MATLAB is installed and ready to use on

- ▶ Intel Lab, etc.: MCS Windows
- ▶ Intel Lab, etc.: MCS Linux (/usr/bin/matlab)
- ► CL MCS Linux server: ssh -X linux.cl.ds.cam.ac.uk
- ► MCS Linux server: ssh -X linux.ds.cam.ac.uk
- Computer Laboratory managed Linux PCs cl-matlab -> /usr/groups/matlab/current/bin/matlab

Campus license allows installation on staff/student home PCs (Linux, macOS, Windows):

- https://help.uis.cam.ac.uk/devices-networks-printing/ compsoft/matlab
- ► Includes toolboxes for Statistics and Machine Learning, Signal Processing, Image Processing, Bioinformatics, Control Systems, Wavelets. . . .
- ▶ Installation requires setting up a http://uk.mathworks.com/account with your @cam.ac.uk email address.

Computer Laboratory researchers can access additional toolboxes:

https://www.cl.cam.ac.uk/local/sys/resources/matlab/

Documentation

- ► Full documentation built in: start matlab then type
 - doc to browse built-in hypertext manual
 - doc command to jump to a specific manual page (e.g. plot)
 - help command to show plain-text summary of a command
- ightharpoonup Read first: doc ightharpoonup MATLAB ightharpoonup Getting Started
- Tutorial videos:

https://uk.mathworks.com/videos/

- Documentation also available online (HTML and PDF):
 - https://uk.mathworks.com/help/matlab/
 - https://uk.mathworks.com/help/ toolboxes

Locally installed MATLAB may be half a year behind the latest release. If you spot problems with the MCS MATLAB installation, please do let the lecturer know (\rightarrow mgk25@cl.cam.ac.uk).

MATLAB matrices (1)

Generate a "magic square" with equal row/column/diagonal sums and assign the resulting 3×3 matrix to variable a:

Assignments and subroutine calls normally end with a semicolon.

Without, MATLAB will print each result. Useful for debugging!

Results from functions not called inside an expression are assigned to the default variable ans.

Type help magic for the manual page of this library function.

MATLAB matrices (2)

Colon generates number sequence:

```
>> 11:14
ans =
          11    12    13    14

>> -1:1
ans =
          -1     0     1

>> 3:0
ans =
          Empty matrix: 1-by-0
```

Specify step size with second colon:

Single matrix cell: a(2,3) == 7. Vectors as indices select several rows and columns. When used inside a matrix index, the variable end provides the highest index value: a(end, end-1) == 9. Using just ":" is equivalent to "1:end" and can be used to select an entire row or column.

8

MATLAB matrices (3)

Select rows, columns and submatrices of a:

```
>> a(1,:)
ans =
     8
          1
              6
>> a(:,1)
ans =
     8
     3
     4
>> a(2:3,1:2)
ans =
     3
          5
     4
          9
```

Matrices can also be accessed as a 1-dimensional vector:

```
>> a(1:5)
ans =
   8
       3
            4
                1
                     5
>> a(6:end)
ans =
   9
            7
                2
       6
>> b = a(1:4:9)
ans =
   8
            2
       5
>> size(b)
ans =
   1
       3
```

MATLAB matrices (4)

Use [] to build new matrices, where , or space as a delimiter joins submatrices horizontally and ; joins them vertically.

```
>> c = [2 7; 3 1]
c =
   2
       7
        1
   3
>> d = [a(:,end) \ a(1,:)']
   6
       8
   7
       1
>> e = [zeros(1,3); a(2,:)]
e =
   0
       0
            0
       5
            7
   3
```

Mask matrix elements:

```
>> find(a > 5)
ans =
    1
    6
    7
    8
>> a(find(a > 5)) = 0
a =
    0    1    0
    3    5    0
    4    0    2
```

ç

Review: matrix multiplication

Each element of the matrix product is the scalar product of the corresponding in the and the corresponding in the

11

Review: inner and outer product of vectors

Special cases of matrix multiplication

Row vector times column vector:

Column vector times row vector:

MATLAB matrices (5)

Operators on scalars and matrices:

```
>> [1 1; 1 0] * [2 3]'
ans =
5
2
>> [1 2 3] .* [10 10 15]
ans =
10 20 45
```

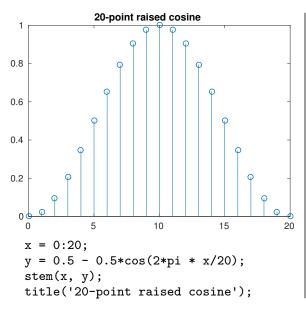

Inner and outer vector product:

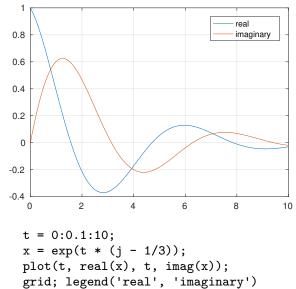

The imaginary unit vector $\sqrt{-1}$ is available as both i and j, and matrices can be complex.

Related functions: real, imag, conj, exp, abs, angle

13

Plotting

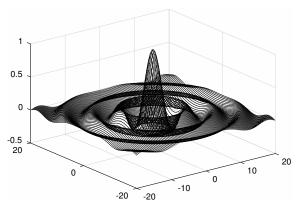

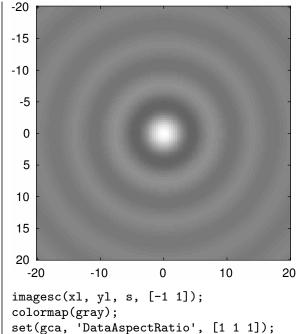

Plotting functions plot, semilogx, semilogy, loglog all expect a pair of vectors for each curve, with x and y coordinates, respectively.

Use saveas(gcf, 'plot2.eps') to save current figure as graphics file.

2D plotting

```
x1 = -20:0.3:20;
y1 = -20:0.3:20;
[x,y] = meshgrid(x1, y1);
r = sqrt(x.^2 + y.^2);
s = sin(r) ./ r; s(find(r==0)) = 1;
plot3(x, y, s);
grid on;
```

15

Some common functions and operators

```
matrix multiplication, exponentiation
/, \setminus, inv
   A/B = AB^{-1}, \ A \setminus B = A^{-1}B, \ A^{-1}
+, -, .*, ./, .^
   element-wise add/sub/mul/div/exp
==, ~=, <, >, <=, >=
   relations result in element-wise 0/1
length, size
   size of vectors and matrices
zeros, ones, eye, diag
   all-0, all-1, identity, diag. matrices
xlim, ylim, zlim
   set plot axes ranges
xlabel, ylabel, zlabel
   label plot axes
audioread, audiowrite, sound
   audio I/O
csvread, csvwrite
   comma-separated-value I/O
```

imread, imwrite, image, imagesc, colormap bitmap image I/O plot, semilog $\{x,y\}$, loglog 2D curve plotting conv, conv2, xcorr 1D/2D convolution, cross/auto-correlation sequence fft, ifft, fft2 discrete Fourier transform sum, prod, min, max sum up rows or columns cumsum, cumprod, diff cumulative sum or product, differentiate row/column find list non-zero indices figure, saveas open new figure, save figure

Functions and m-files

To define a new function, for example decibel(x) = $10^{x/20}$, write into a file decibel.m the lines

```
function f = decibel(x)
% DECIBEL(X) converts a decibel figure X into a factor
f = 10 .^ (x ./ 20);
```

Only the function that has the same name as the m-file in which it is defined can be called from outside the file; all other functions are only visible inside the file. The function keyword sets the variable whose value will be returned and lists the parameter variables.

The m-file must be in the current directory (cd) or MATLAB's search path (path) to become accessible.

Use edit db to edit the m-file, help db to show the first comment lines and type db to show its source text.

M-files can also contain just sequences of statements instead of a function definition. These are called simply by typing their name.

17

Example: generating an audio illusion

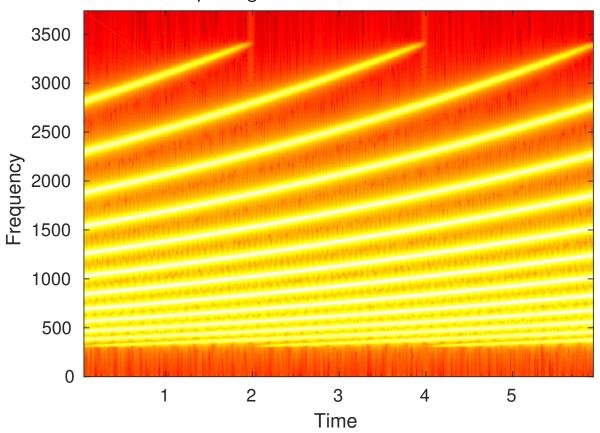

Generate an audio file with 12 sine tones of apparently continuously exponentially increasing frequency, which never leave the frequency range 300–3400 Hz. Do this by letting them wrap around the frequency interval and reduce their volume near the interval boundaries based on a raised-cosine curve applied to the logarithm of the frequency.

First produce a 2 s long waveform in which each tone raises 1/12 of the frequency range, then concatenate that into a 60 s long 16-bit WAV file, mono, with 16 kHz sampling rate. Avoid phase jumps.

Parameters:

```
fs = 16000; % sampling frequency [Hz]
d = 2; % time after which waveform repeats [s]
n = 12; % number of tones
fmin = 300; % lowest frequency
fmax = 3400; % highest frequency
```

Spectrogram of the first 6 s:

19

Example solution:

```
t = 0:1/fs:d-1/fs;
                    % timestamps for each sample point
% normalized logarithm of frequency of each tone (row)
% for each sample point (column), all rising linearly
% from 0 to 1, then wrap around back to 0
1 = mod(((0:n-1)/n)' * ones(1, fs*d) + ones(n,1) * (t/(d*n)), 1);
p = 2*pi * cumsum(f, 2) / fs; % phase for each tone and sample
\% make last column a multiple of 2*pi for phase continuity
p = diag((2*pi*floor(p(:,end)/(2*pi))) ./ p(:,end)) * p;
              % sine value for each tone and sample
s = sin(p);
% mixing amplitudes from raised-cosine curve over frequency
a = 0.5 - 0.5 * cos(2*pi * 1);
w = sum(s .* a)/n; \% mix tones together, normalize to [-1, +1]
w = repmat(w, 1, 3);  % repeat waveform 3x
specgram(w, 2048, fs, 2048, 1800); ylim([0 fmax*1.1]) % plot
w = repmat(w, 1, 20);  % repeat waveform 20x
audiowrite('ladder.wav', w, fs, 'BitsPerSample', 16); % make audio file
```

A variant of this audio effect, where each tone is exactly one octave (factor 2 in frequency) from the next, is known as the *Shepard–Risset glissando*.

What changes to the parameters would produce that?
