

Lecture 3:

Goal-oriented interaction

Using cognitive theories of planning, learning and understanding to understand user behaviour, and what they find hard.

Overview of the course

- Theory driven approaches to HCI
- Design of visual displays
- **Goal-oriented interaction**
- Designing smart systems (guest lecturer)
- Designing efficient systems
- Designing meaningful systems (guest lecturer)
- Evaluating interactive system designs
- Designing complex systems

***A Metatheory* (in first-wave HCI):**
**User interaction can be modelled as
search**

Reminder from Prolog course: problem solving using graph search

From Rice &
Beresford

Turn the problem into a graph

Encode as Prolog facts to solve

route(a,g).

route(g,l).

route(l,s).

...

travel(A,A).

travel(A,C) :- route(A,B),travel(B,C).

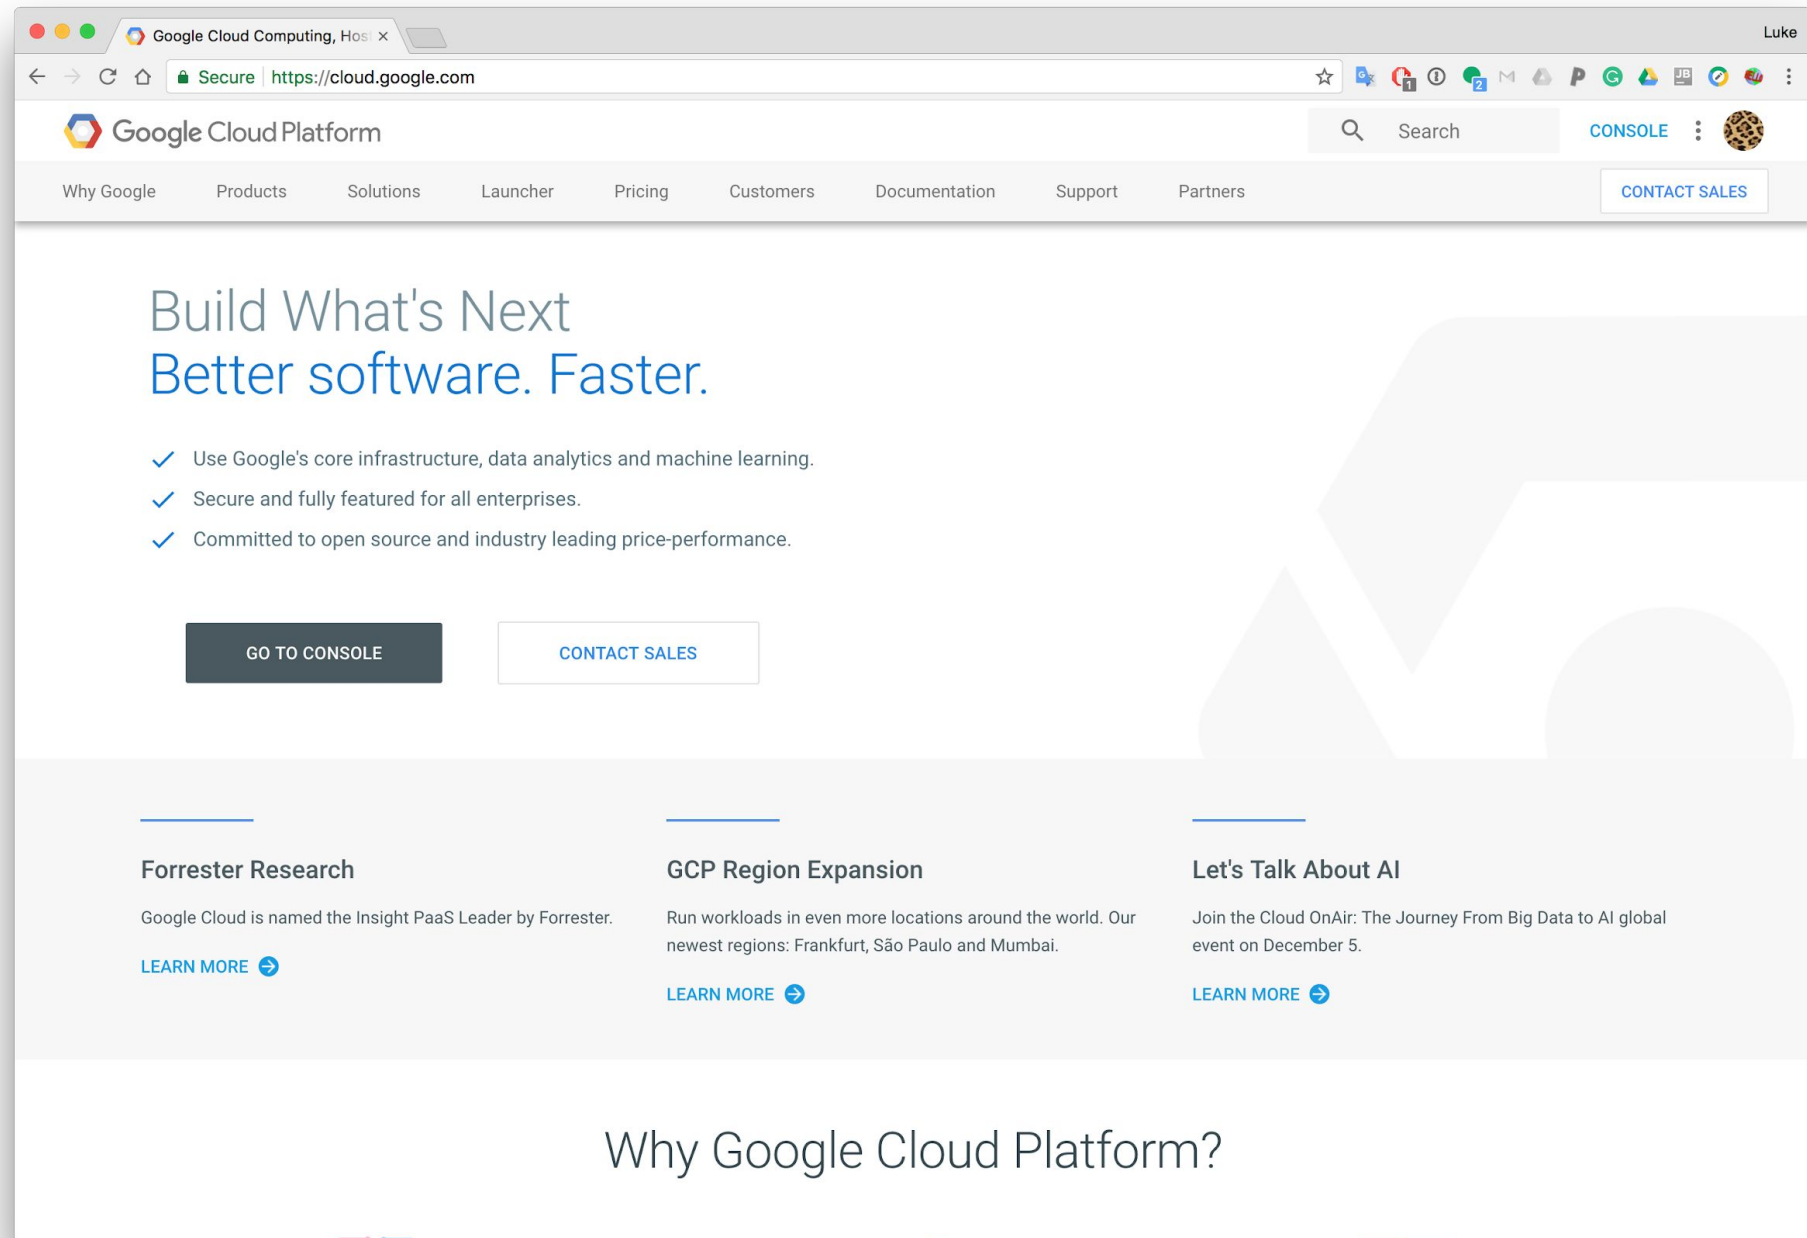

solve :- start(A),finish(B), travel(A,B).

start(a).

finish(u).

HCI example of a **User Goal**:

“How much did my use of Google Cloud Platform cost me last month?”

Build What's Next Better software. Faster.

- ✓ Use Google's core infrastructure, data analytics and machine learning.
- ✓ Secure and fully featured for all enterprises.
- ✓ Committed to open source and industry leading price-performance.

The screenshot shows the Google Cloud Platform website in a browser window. The browser's address bar displays 'Secure | https://cloud.google.com'. The page features a navigation bar with the Google Cloud Platform logo, a search bar, and a 'CONSOLE' button. Below the navigation bar is a horizontal menu with links: 'Why Google', 'Products', 'Solutions', 'Launcher', 'Pricing', 'Customers', 'Documentation', 'Support', and 'Partners'. A 'CONTACT SALES' button is located on the right side of the navigation bar. The main content area has a large heading 'Build What's Next Better software. Faster.' followed by three bullet points: 'Use Google's core infrastructure, data analytics and machine learning.', 'Secure and fully featured for all enterprises.', and 'Committed to open source and industry leading price-performance.'. Below the bullet points are two buttons: 'GO TO CONSOLE' and 'CONTACT SALES'. The footer section contains three columns of content: 'Forrester Research' with a 'LEARN MORE' button, 'GCP Region Expansion' with a 'LEARN MORE' button, and 'Let's Talk About AI' with a 'LEARN MORE' button. The text 'Why Google Cloud Platform?' is visible at the bottom of the page.

The screenshot shows the Google Cloud Platform console interface. Red circles highlight the following elements:

- Google Cloud Platform logo and search bar in the top navigation bar.
- Navigation menu items: Compute Engine, App Engine, Datastore, Storage, Cloud Launcher, Billing, APIs & Services, Support, IAM & admin, Getting started, App Engine, Compute Engine, Kubernetes Engine, and Cloud Functions.
- Dashboard tabs: DASHBOARD and ACTIVITY.
- Project info section: Go to project settings.
- Resources section: App Engine (2 versions), Compute Engine (1 instance), and Cloud Storage (2 buckets).
- Trace section: Go to latency overview.
- App Engine summary chart: Go to the App Engine dashboard.
- Compute Engine summary chart: Go to the Compute Engine dashboard.
- Google Cloud Platform status: Go to Cloud status dashboard.
- Billing section: View detailed charges.
- Error Reporting section: Go to Error Reporting.

The console also displays various charts and data, including a line chart for App Engine response count, a line chart for Compute Engine CPU utilization, and a table for latency percentiles of most requested URIs.

Human problems as AI search

Alan's ultimate goal: Make a lot of money

Some nodes in the search tree that must be arranged in order:

- Get a high paying job
- Save the money
- Work in the City
- Attend a job interview
- Apply for a job
- Travel to London
- Buy a train ticket
- Go to the station ...

Reminder from Part 1a: Cognitive Walkthrough

“eh?”

(Example from Richard Young)

How many times should the
calculator user press AC?

Classical theories of metareasoning

- Optimal search
 - Find the best possible solution within stated constraints on resources
- Bounded rationality
 - Computation is one of the constraints
- Satisficing
 - Find a satisfactory solution within computation constraints

Neuro-economic models of reasoning

- Behavioural economics, popularly known as “Nudge”
- Original basis in “prospect theory” (Kahneman & Tversky)
 - General theory of decision making
 - Construct a utility model, based on outcome of possible actions
 - Weight estimated values by likelihood
 - Choose action with optimal utility
 - May include future value discounting
- In practice, the optimisation is more likely to involve satisficing, due to reasoning with bounded rationality constraints
 - In Kahneman’s terms “thinking fast and slow”

Bounded rationality in humans

- Apply *heuristics* rather than searching for optimal plan
 - Availability heuristic - reason based on examples easily to hand
 - Affect heuristic – base decision on emotion rather than calculating cost / benefit
 - Representativeness heuristic - judge probability based on resemblance
- Apply *biases* to ensure estimation error within tolerable bounds
 - Loss aversion - losses hurt more than gains feel good
 - Expectation bias - researchers (even in HCI) find results they expected
 - Bandwagon effect - do what other people do
- And many others!

Behavioural economics in programming

- “Attention Investment theory” of abstraction use
 - Automation requires abstract specification
 - e.g. defining a regular expression for search and replace
 - Benefit of automation is saving time and concentration in future
 - But abstract specification (programming) takes time and concentration!
 - And powerful abstractions (programs) can go wrong powerfully
 - User may prefer repetitive manual operations - safe and incremental
- So utility function will compare future saving of attention from programming vs costs of concentrating on a risky strategy
 - Biases such as loss aversion will apply
 - Bounded rationality will apply, since deciding what to do takes even more concentration

The limitations of goal based HCI

It assumes the user doesn't make mistakes

- Would need a cognitive model of why error occurred
 - Information loss due to cognitive limitations
 - Incorrect mental model
 - Misleading design
- Need description of user journey that accounts for problem identification, diagnosis, debugging, testing, iteration etc

It assumes the user has the right goal

- Persuasive design is a field of HCI that addresses goal formation
- Applications:
 - Reduce energy consumption
 - Promote exercise
 - Manage diet and nutrition
 - Smoking cessation
- May include “nudge” to account for biases
 - But paternalistic / patronising

It assumes the user knows what the goal is

- Not true when the purpose is an experience (third wave HCI)
- Not true in “exploratory design”
- More attention to this later in the course
- Some problems can't be decomposed into actions
- Sometimes actions have side effects

Wicked problems

Including material provided by
Steven Tanimoto

A Wicked Problem:

Slowing climate change

More Wicked Problems

- Stopping the spread of antibiotic-resistant diseases
- Halting nuclear proliferation
- Ending homelessness in Cambridge
- Avoiding species extinction
- Colonizing Mars

Rittel-Webber Characteristics 1-5 of 10

1. There is no definitive formulation of a wicked problem
2. Wicked problems have no stopping rule
3. Solutions to wicked problems are not true-or-false, but good-or-bad
4. There is no immediate and no ultimate test of a solution to a wicked problem
5. Every solution to a wicked problem is a “one-shot operation”; because there is no opportunity to learn by trial-and-error, every attempt counts significantly

Rittel-Webber Characteristics 6-10 of 10

6. Wicked problems do not have an enumerable (or an exhaustively describable) set of potential solutions, **nor is there a well-described set of permissible operations** that may be incorporated into the plan
7. Every wicked problem is essentially unique
8. Every wicked problem can be considered to be a symptom of another problem
9. The existence of a discrepancy representing a wicked problem can be explained in numerous ways. The choice of explanation determines the nature of the problem's resolution
10. **The planner has no right to be wrong**

Discuss with your supervisor:

“How might you design software to help solve wicked problems?”
