

Recall : λ -Terms, M

are built up from a given, countable collection of

- ▶ variables x, y, z, \dots

by two operations for forming λ -terms:

- ▶ λ -abstraction: $(\lambda x.M)$
(where x is a variable and M is a λ -term)
- ▶ application: $(M M')$
(where M and M' are λ -terms).

β -Reduction

Recall that $\lambda x.M$ is intended to represent the function f such that $f(x) = M$ for all x . We can regard $\lambda x.M$ as a function on λ -terms via substitution: map each N to $M[N/x]$.

↑ result of Substituting
N for free x in M

Substitution $N[M/x]$

$$\begin{aligned}x[M/x] &= M \\y[M/x] &= y \quad \text{if } y \neq x \\(\lambda y.N)[M/x] &= \lambda y.N[M/x] \quad \text{if } y \# (M x) \\(N_1 N_2)[M/x] &= N_1[M/x] N_2[M/x]\end{aligned}$$

$N[M/x]$ = result of replacing all free occurrences
of x in N with M , avoiding
"Capture" of free variables in M by
 λ -binders in N

Substitution $N[M/x]$

$$\begin{aligned} x[M/x] &= M \\ y[M/x] &= y \quad \text{if } y \neq x \\ (\lambda y. N)[M/x] &= \lambda y. N[M/x] \quad \text{if } y \# (M x) \\ (N_1 N_2)[M/x] &= N_1[M/x] N_2[M/x] \end{aligned}$$

Side-condition $y \# (M x)$ (y does not occur in M and $y \neq x$) makes substitution “capture-avoiding”.

E.g. if $x \neq y$

$$(\lambda y. x)[y/x] \neq \lambda y. y$$

Substitution $N[M/x]$

$$\begin{aligned}x[M/x] &= M \\y[M/x] &= y \quad \text{if } y \neq x \\(\lambda y.N)[M/x] &= \lambda y.N[M/x] \quad \text{if } y \# (M x) \\(N_1 N_2)[M/x] &= N_1[M/x] N_2[M/x]\end{aligned}$$

Can always satisfy this up to α -equivalence

E.g. if $x \neq y \neq z \neq x$

$$(\lambda y.x)[y/x] =_{\alpha} (\lambda z.x)[y/x] = \lambda z.y$$

In fact $N \mapsto N[M/x]$ induces a totally defined function from the set of α -equivalence classes of λ -terms to itself.

$$\lambda x. (\lambda z. z) y x [\lambda z. y / y]$$

=

$$\lambda x. (\lambda z. z) y x [\lambda z. y / y]$$

no possible
capture

=

$$\lambda x. (\lambda z.z) y x [\lambda z.y / y]$$

$$= \lambda x. (\lambda z.z)(\lambda z.y) x$$

$$\lambda x. (\lambda u.u) xy [\lambda y.x / y]$$

=

$$\lambda x. (\lambda z. z) y x [\lambda x. y / y]$$

$$= \lambda x. (\lambda z. z) (\lambda x. y) x$$

$$\lambda x. (\lambda u. u) x y [\lambda y. x / y] \quad \text{possible capture}$$

=

$$\begin{aligned} & \lambda x. (\lambda z. z) y x [\lambda x. y / y] \\ = & \lambda x. (\lambda z. z) (\lambda x. y) x \end{aligned}$$

$$\begin{aligned} & \lambda x. (\lambda u. u) x y [\lambda y. x / y] \quad \text{possible capture...} \\ =_{\alpha} & \lambda z. (\lambda u. u) z y [\lambda y. x / y] \quad \dots \alpha\text{-convert to avoid} \end{aligned}$$

$$\begin{aligned} & \lambda x. (\lambda z. z) y x [\lambda x. y / y] \\ = & \lambda x. (\lambda z. z) (\lambda x. y) x \end{aligned}$$

$$\begin{aligned} & \lambda x. (\lambda u. u) x y [\lambda y. x / y] \quad \text{possible capture...} \\ =_{\alpha} & \lambda z. (\lambda u. u) z y [\lambda y. x / y] \quad \dots \alpha\text{-convert to avoid} \\ = & \lambda z. (\lambda u. u) z (\lambda y. x) \end{aligned}$$

β -Reduction

Recall that $\lambda x.M$ is intended to represent the function f such that $f(x) = M$ for all x . We can regard $\lambda x.M$ as a function on λ -terms via substitution: map each N to $M[N/x]$.

So the natural notion of computation for λ -terms is given by stepping from a

β -redex $(\lambda x.M)N$

to the corresponding

β -reduct $M[N/x]$

β -Reduction

One-step β -reduction, $M \rightarrow M'$:

$$\frac{}{(\lambda x.M)N \rightarrow M[N/x]}$$

$$\frac{M \rightarrow M'}{\lambda x.M \rightarrow \lambda x.M'}$$

$$\frac{M \rightarrow M'}{MN \rightarrow M'N}$$

$$\frac{M \rightarrow M'}{NM \rightarrow NM'}$$

$$\frac{N =_{\alpha} M \quad M \rightarrow M' \quad M' =_{\alpha} N'}{N \rightarrow N'}$$

β -Reduction

E.g.

$$\begin{array}{ccc} & ((\lambda y.\lambda z.z)u)y & \\ (\lambda x.x\,y)((\lambda y.\lambda z.z)u) \nearrow & & \searrow (\lambda z.z)y \longrightarrow y \\ & (\lambda x.x\,y)(\lambda z.z) & \end{array}$$

β -Reduction

E.g.

$$\begin{array}{ccc} & ((\lambda y.\lambda z.z)u)y & \\ (\lambda x.x\,y)((\lambda \textcolor{red}{y}.\lambda z.z)\textcolor{red}{u}) & \xrightarrow{\hspace{10em}} & (\lambda z.z)y \longrightarrow y \\ & \xrightarrow{\hspace{10em}} & (\lambda x.x\,y)(\lambda z.z) \end{array}$$

β -Reduction

E.g.

$$\begin{array}{ccc} & ((\lambda y.\lambda z.z)u)y & \\ (\lambda x.x y)((\lambda y.\lambda z.z)u) \nearrow & & \searrow \\ & (\lambda x.x y)(\lambda z.z) & \\ & \nearrow & \searrow \\ & (\lambda z.z)y \longrightarrow y & \end{array}$$

β -Reduction

E.g.

$$\begin{array}{ccc} & ((\lambda y.\lambda z.z)u)y & \\ (\lambda x.x\,y)((\lambda y.\lambda z.z)u) \nearrow & & \searrow \\ & (\lambda x.x\,y)(\lambda z.z) & \\ & \nearrow & \searrow \\ & (\lambda z.z)y \longrightarrow y & \end{array}$$

β -Reduction

E.g.

$$\begin{array}{ccc} & ((\lambda y.\lambda z.z)u)y & \\ (\lambda x.x y)((\lambda y.\lambda z.z)u) \nearrow & & \searrow \\ & (\lambda x.x y)(\lambda z.z) & \\ & \nearrow & \searrow \\ & (\lambda z.z)y \longrightarrow y & \end{array}$$

Many-step β -reduction, $M \twoheadrightarrow M'$:

$$\frac{M =_{\alpha} M'}{M \rightarrow M'}$$

(no steps)

$$\frac{M \rightarrow M' \quad M' \rightarrow M''}{M \twoheadrightarrow M''}$$

(1 more step)

E.g.

$$(\lambda x.x\ y)((\lambda y\ z.z)u) \twoheadrightarrow y$$

$$(\lambda x.\lambda y.x)y \twoheadrightarrow \lambda z.y$$

β -Conversion $M =_{\beta} N$

Informally: $M =_{\beta} N$ holds if N can be obtained from M by performing zero or more steps of α -equivalence, β -reduction, or β -expansion (= inverse of a reduction).

E.g. $u((\lambda x y. v x)y) =_{\beta} (\lambda x. u x)(\lambda x. v y)$

because $(\lambda x. u x)(\lambda x. v y) \rightarrow u(\lambda x. v y)$

and so we have

$$u((\lambda x y. v x)y) =_{\alpha} u((\lambda x y'. v x)y)$$

β -Conversion $M =_{\beta} N$

Informally: $M =_{\beta} N$ holds if N can be obtained from M by performing zero or more steps of α -equivalence, β -reduction, or β -expansion (= inverse of a reduction).

E.g. $u((\lambda x y. v x)y) =_{\beta} (\lambda x. u x)(\lambda x. v y)$

because $(\lambda x. u x)(\lambda x. v y) \rightarrow u(\lambda x. v y)$

and so we have

$$\begin{aligned} u((\lambda x y. v x)y) &=_{\alpha} u((\lambda x y'. v x)y) \\ &\rightarrow u(\lambda y'. v y) \end{aligned} \quad \text{reduction}$$

β -Conversion $M =_{\beta} N$

Informally: $M =_{\beta} N$ holds if N can be obtained from M by performing zero or more steps of α -equivalence, β -reduction, or β -expansion (= inverse of a reduction).

E.g. $u((\lambda x y. v x)y) =_{\beta} (\lambda x. u x)(\lambda x. v y)$

because $(\lambda x. u x)(\lambda x. v y) \rightarrow u(\lambda x. v y)$

and so we have

$$\begin{aligned} u((\lambda x y. v x)y) &=_{\alpha} u((\lambda x y'. v x)y) \\ &\rightarrow u(\lambda y'. v y) && \text{reduction} \\ &=_{\alpha} u(\lambda x. v y) \end{aligned}$$

β -Conversion $M =_{\beta} N$

Informally: $M =_{\beta} N$ holds if N can be obtained from M by performing zero or more steps of α -equivalence, β -reduction, or β -expansion (= inverse of a reduction).

E.g. $u((\lambda x y. v x)y) =_{\beta} (\lambda x. u x)(\lambda x. v y)$

because $(\lambda x. u x)(\lambda x. v y) \rightarrow u(\lambda x. v y)$

and so we have

$$\begin{aligned} u((\lambda x y. v x)y) &=_{\alpha} u((\lambda x y'. v x)y) \\ &\rightarrow u(\lambda y'. v y) && \text{reduction} \\ &=_{\alpha} u(\lambda x. v y) \\ &\leftarrow (\lambda x. u x)(\lambda x. v y) && \text{expansion} \end{aligned}$$

β -Conversion $M =_{\beta} N$

is the binary relation inductively generated by the rules:

$$\frac{M =_{\alpha} M'}{M =_{\beta} M'}$$

$$\frac{M \rightarrow M'}{M =_{\beta} M'}$$

$$\frac{M =_{\beta} M'}{M' =_{\beta} M}$$

$$\frac{M =_{\beta} M' \quad M' =_{\beta} M''}{M =_{\beta} M''}$$

$$\frac{M =_{\beta} M'}{\lambda x.M =_{\beta} \lambda x.M'}$$

$$\frac{M =_{\beta} M' \quad N =_{\beta} N'}{MN =_{\beta} M'N'}$$

Church-Rosser Theorem

Theorem. $\rightarrow\!\!\!\rightarrow$ is confluent, that is, if $M_1 \xleftarrow{} M \rightarrow\!\!\!\rightarrow M_2$, then there exists M' such that $M_1 \rightarrow\!\!\!\rightarrow M' \xleftarrow{} M_2$.

[Proof omitted.]

Church-Rosser Theorem

Theorem. \Rightarrow is confluent, that is, if $M_1 \xleftarrow{} M \xrightarrow{} M_2$, then there exists M' such that $M_1 \xrightarrow{} M' \xleftarrow{} M_2$.

Corollary. To show that two terms are β -convertible, it suffices to show that they both reduce to the same term. More precisely: $M_1 =_{\beta} M_2$ iff $\exists M (M_1 \xrightarrow{} M \xleftarrow{} M_2)$.

Church-Rosser Theorem

Theorem. $\rightarrow\!\rightarrow$ is confluent, that is, if $M_1 \xleftarrow{} M \rightarrow\!\rightarrow M_2$, then there exists M' such that $M_1 \rightarrow\!\rightarrow M' \xleftarrow{} M_2$.

Corollary. $M_1 =_{\beta} M_2$ iff $\exists M (M_1 \rightarrow\!\rightarrow M \xleftarrow{} M_2)$.

Proof. $=_{\beta}$ satisfies the rules generating $\rightarrow\!\rightarrow$; so $M \rightarrow\!\rightarrow M'$ implies $M =_{\beta} M'$. Thus if $M_1 \rightarrow\!\rightarrow M \xleftarrow{} M_2$, then $M_1 =_{\beta} M =_{\beta} M_2$ and so $M_1 =_{\beta} M_2$.

Conversely,

Church-Rosser Theorem

Theorem. $\rightarrow\!\!\!\rightarrow$ is confluent, that is, if $M_1 \xleftarrow{M} M \rightarrow\!\!\!\rightarrow M_2$, then there exists M' such that $M_1 \rightarrow\!\!\!\rightarrow M' \xleftarrow{M} M_2$.

Corollary. $M_1 =_{\beta} M_2$ iff $\exists M (M_1 \rightarrow\!\!\!\rightarrow M \xleftarrow{M} M_2)$.

Proof. $=_{\beta}$ satisfies the rules generating $\rightarrow\!\!\!\rightarrow$; so $M \rightarrow\!\!\!\rightarrow M'$ implies $M =_{\beta} M'$. Thus if $M_1 \rightarrow\!\!\!\rightarrow M \xleftarrow{M} M_2$, then $M_1 =_{\beta} M =_{\beta} M_2$ and so $M_1 =_{\beta} M_2$.

Conversely, the relation $\{(M_1, M_2) \mid \exists M (M_1 \rightarrow\!\!\!\rightarrow M \xleftarrow{M} M_2)\}$ satisfies the rules generating $=_{\beta}$: the only difficult case is closure of the relation under transitivity and for this we use the Church-Rosser theorem: $M_1 \longrightarrow\!\!\!\rightarrow M \xleftarrow{M} M_2 \longrightarrow\!\!\!\rightarrow M' \xleftarrow{M} M_3$

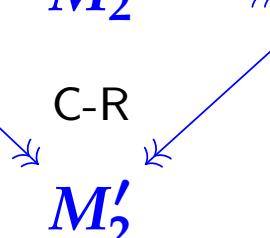

Church-Rosser Theorem

Theorem. $\rightarrow\!\!\!\rightarrow$ is confluent, that is, if $M_1 \xleftarrow{} M \rightarrow\!\!\!\rightarrow M_2$, then there exists M' such that $M_1 \rightarrow\!\!\!\rightarrow M' \xleftarrow{} M_2$.

Corollary. $M_1 =_{\beta} M_2$ iff $\exists M (M_1 \rightarrow\!\!\!\rightarrow M \xleftarrow{} M_2)$.

Proof. $=_{\beta}$ satisfies the rules generating $\rightarrow\!\!\!\rightarrow$; so $M \rightarrow\!\!\!\rightarrow M'$ implies $M =_{\beta} M'$. Thus if $M_1 \rightarrow\!\!\!\rightarrow M \xleftarrow{} M_2$, then $M_1 =_{\beta} M =_{\beta} M_2$ and so $M_1 =_{\beta} M_2$.

Conversely, the relation $\{(M_1, M_2) \mid \exists M (M_1 \rightarrow\!\!\!\rightarrow M \xleftarrow{} M_2)\}$ satisfies the rules generating $=_{\beta}$: the only difficult case is closure of the relation under transitivity and for this we use the Church-Rosser theorem:

$$M_1 \xrightarrow{\quad} M \xleftarrow{\quad} M_2 \xrightarrow{\quad} M' \xleftarrow{\quad} M_3$$

Church-Rosser Theorem

Theorem. $\rightarrow\!\rightarrow$ is confluent, that is, if $M_1 \xleftarrow{M} M \rightarrow\!\rightarrow M_2$, then there exists M' such that $M_1 \rightarrow\!\rightarrow M' \xleftarrow{M} M_2$.

Corollary. $M_1 =_{\beta} M_2$ iff $\exists M (M_1 \rightarrow\!\rightarrow M \xleftarrow{M} M_2)$.

Proof. $=_{\beta}$ satisfies the rules generating $\rightarrow\!\rightarrow$; so $M \rightarrow\!\rightarrow M'$ implies $M =_{\beta} M'$. Thus if $M_1 \rightarrow\!\rightarrow M \xleftarrow{M} M_2$, then $M_1 =_{\beta} M =_{\beta} M_2$ and so $M_1 =_{\beta} M_2$.

Hence $M_1 =_{\beta} M_2$ implies $\exists M (M_1 \rightarrow\!\rightarrow M' \xleftarrow{M} M_2)$.

β -Normal Forms

Definition. A λ -term N is in β -normal form (nf) if it contains no β -redexes (no sub-terms of the form $(\lambda x.M)M'$). M has β -nf N if $M =_{\beta} N$ with N a β -nf.

β -Normal Forms

Definition. A λ -term N is in β -normal form (nf) if it contains no β -redexes (no sub-terms of the form $(\lambda x.M)M'$). M has β -nf N if $M =_{\beta} N$ with N a β -nf.

Note that if N is a β -nf and $N \rightarrow N'$, then it must be that $N =_{\alpha} N'$ (why?).

Hence if $N_1 =_{\beta} N_2$ with N_1 and N_2 both β -nfs, then $N_1 =_{\alpha} N_2$. (For if $N_1 =_{\beta} N_2$, then by Church-Rosser $N_1 \rightarrow M' \leftarrow N_2$ for some M' , so $N_1 =_{\alpha} M' =_{\alpha} N_2$.)

So the β -nf of M is unique up to α -equivalence if it exists.

(and if M does have β -nf N , then
 $M \rightarrow N$)

Non-termination

Some λ terms have no β -nf.

E.g. $\Omega \triangleq (\lambda x.x\,x)(\lambda x.x\,x)$ satisfies

- ▶ $\Omega \rightarrow (x\,x)[(\lambda x.x\,x)/x] = \Omega$,
- ▶ $\Omega \twoheadrightarrow M$ implies $\Omega =_\alpha M$.

So there is no β -nf N such that $\Omega =_\beta N$.

Non-termination

Some λ terms have no β -nf.

E.g. $\Omega \triangleq (\lambda x.x x)(\lambda x.x x)$ satisfies

- ▶ $\Omega \rightarrow (x x)[(\lambda x.x x)/x] = \Omega$,
- ▶ $\Omega \twoheadrightarrow M$ implies $\Omega =_\alpha M$.

So there is no β -nf N such that $\Omega =_\beta N$.

A term can possess both a β -nf and infinite chains of reduction from it.

E.g. $(\lambda x.y)\Omega \rightarrow y$, but also $(\lambda x.y)\Omega \rightarrow (\lambda x.y)\Omega \rightarrow \dots$

Non-termination

Normal-order reduction is a deterministic strategy for reducing λ -terms: reduce the “left-most, outer-most” redex first.

- ▶ left-most: reduce M before N in MN , and then
- ▶ outer-most: reduce $(\lambda x.M)N$ rather than either of M or N .

(cf. call-by-name evaluation).

Fact: normal-order reduction of M always reaches the β -nf of M if it possesses one.

$$\frac{M_1 =_\alpha M'_1 \quad M'_1 \rightarrow_{\text{NOR}} M'_2 \quad M'_2 =_\alpha M_2}{M_1 \rightarrow_{\text{NOR}} M_2}$$

$$M_1 \rightarrow_{\text{NOR}} M_2$$

$$\frac{M \rightarrow_{\text{NOR}} M'}{\lambda x. M \rightarrow_{\text{NOR}} \lambda x. M'}$$

$$M_1 \rightarrow_{\text{NOR}} M'_1$$

$$M_1 M_2 \rightarrow_{\text{NOR}} M'_1 M'_2$$

$$(\lambda x. N) M \rightarrow_{\text{NOR}} N[M/x]$$

$$M \rightarrow_{\text{NOR}} M'$$

$$UM \rightarrow_{\text{NOR}} UM'$$

where $\left\{ \begin{array}{l} U ::= x \mid UN \\ N ::= \lambda x. N \mid U \end{array} \right.$

β -normal forms "neutral" forms
