Register machines

Algorithms, informally

No precise definition of "algorithm" at the time Hilbert posed the *Entscheidungsproblem*, just examples.

Common features of the examples:

- finite description of the procedure in terms of elementary operations
- deterministic (next step uniquely determined if there is one)
- procedure may not terminate on some input data, but we can recognize when it does terminate and what the result is.

Register Machines, informally

They operate on natural numbers $\mathbb{N} = \{0, 1, 2, \ldots\}$ stored in (idealized) registers using the following "elementary operations":

- add 1 to the contents of a register
- test whether the contents of a register is 0
- subtract 1 from the contents of a register if it is non-zero
- jumps ("goto")
- conditionals ("if_then_else_")

Definition. A register machine is specified by:

- finitely many registers $\mathtt{R}_0$, $\mathtt{R}_1$, . . . , $\mathtt{R}_n$
  (each capable of storing a natural number);
- a program consisting of a finite list of instructions of the form $label : body$, where for $i = 0, 1, 2, \ldots$, the $(i+1)^{\text{th}}$ instruction has label $\mathtt{L}_i$.

Definition. A register machine is specified by:

- finitely many registers $\mathtt{R}_0$, $\mathtt{R}_1$, . . . , $\mathtt{R}_n$ (each capable of storing a natural number);
- a program consisting of a finite list of instructions of the form *label* : *body*, where for $i = 0, 1, 2, \ldots$, the $(i+1)^{\text{th}}$ instruction has label $\mathtt{L}_i$.

Instruction body takes one of three forms:

$R^+ \to L'$	add 1 to contents of register R and jump to instruction labelled L'
$R^- \to L', L''$	if contents of R is > 0, then subtract 1 from it and jump to L', else jump to L''
HALT	stop executing instructions

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 :$ HALT

example computation:

L_i	R_0	R_1	R_2
0	0	1	2

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 :$ HALT

example computation:

L_i	R_0	R_1	R_2
0	0	1	2

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 :$ HALT

example computation:

L_i	R_0	R_1	R_2
0	0	1	2
1	0	0	2

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 :$ HALT

example computation:

L_i	R_0	R_1	R_2
0	0	1	2
1	0	0	2
0	1	0	2

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 :$ HALT

example computation:

L_i	R_0	R_1	R_2
0	0	1	2
1	0	0	2
0	1	0	2
2	1	0	2

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 : \mathtt{HALT}$

example computation:

L_i	R_0	R_1	R_2
0	0	1	2
1	0	0	2
0	1	0	2
2	1	0	2
3	1	0	1

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 : \mathtt{HALT}$

example computation:

L_i	R_0	R_1	R_2
0	0	1	2
1	0	0	2
0	1	0	2
2	1	0	2
3	1	0	1
2	2	0	1

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 :$ HALT

example computation:

L_i	R_0	R_1	R_2
0	0	1	2
1	0	0	2
0	1	0	2
2	1	0	2
3	1	0	1
2	2	0	1
3	2	0	0

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 : \mathrm{HALT}$

example computation:

L_i	R_0	R_1	R_2
0	0	1	2
1	0	0	2
0	1	0	2
2	1	0	2
3	1	0	1
2	2	0	1
3	2	0	0
2	3	0	0

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 : \mathtt{HALT}$

example computation:

L_i	R_0	R_1	R_2
0	0	1	2
1	0	0	2
0	1	0	2
2	1	0	2
3	1	0	1
2	2	0	1
3	2	0	0
2	3	0	0
4	3	0	0

Register machine computation

Register machine configuration:

$$c = (\ell, r_0, \ldots, r_n)$$

where ℓ = current label and r_i = current contents of $\mathtt{R}_i$.

Notation: "$\mathtt{R}_i = x$ [in configuration c]" means $c = (\ell, r_0, \ldots, r_n)$ with $r_i = x$.

Register machine computation

Register machine configuration:

$$c = (\ell, r_0, \dots, r_n)$$

where ℓ = current label and r_i = current contents of $\mathtt{R}_i$.

Notation: "$\mathtt{R}_i = x$ [in configuration c]" means $c = (\ell, r_0, \dots, r_n)$ with $r_i = x$.

Initial configurations:

$$c_0 = (0, r_0, \dots, r_n)$$

where r_i = initial contents of register $\mathtt{R}_i$.

Register machine computation

A computation of a RM is a (finite or infinite) sequence of configurations

$$c_0, c_1, c_2, \ldots$$

where

- $c_0 = (0, r_0, \ldots, r_n)$ is an initial configuration
- each $c = (\ell, r_0, \ldots, r_n)$ in the sequence determines the next configuration in the sequence (if any) by carrying out the program instruction labelled L_ℓ with registers containing $r_0, \ldots, r_n$.

Halting

For a finite computation $c_0, c_1, \ldots, c_m$, the last configuration $c_m = (\ell, r, \ldots)$ is a halting configuration, i.e.

either $\ell \geq$ number of instructions in program (an "erroneous halt")

or ℓ^{th} instruction in program has body HALT (a "proper halt")

E.g.

$$\begin{array}{l} L_0 : R_0^+ \to L_2 \\ L_1 : \mathrm{HALT} \end{array}$$

halts erroneously (has computation sequences $[(0, x), (2, x+1)]$)

Halting

For a finite computation $c_0, c_1, \ldots, c_m$, the last configuration $c_m = (\ell, r, \ldots)$ is a halting configuration, i.e.

either $\ell \geq$ number of instructions in program (an "erroneous halt")

or ℓ^{th} instruction in program has body HALT (a "proper halt")

N.B. can always modify programs (without affecting their computations) to turn all erroneous halts into proper halts by adding extra `HALT` instructions to the list with appropriate labels.

Halting

For a finite computation $c_0, c_1, \ldots, c_m$, the last configuration $c_m = (\ell, r, \ldots)$ is a halting configuration.

Note that computations may never halt. For example,

$\mathtt{L_0} : \mathtt{R_0^+} \to \mathtt{L_0}$
$\mathtt{L_1} : \mathtt{HALT}$

only has infinite computation sequences

$$(0, r), (0, r+1), (0, r+2), \ldots$$

Graphical representation

- one node in the graph for each instruction
- arcs represent jumps between instructions
- lose sequential ordering of instructions—so need to indicate initial instruction with START.

instruction	representation
$R^+ \to L$	$R^+ \longrightarrow [L]$
$R^- \to L, L'$	R^- $\nearrow [L]$ $\searrow\!\!\!\to [L']$
HALT	HALT
L_0	START $\longrightarrow [L_0]$

Example

registers:

$R_0\ R_1\ R_2$

program:

$L_0 : R_1^- \to L_1, L_2$

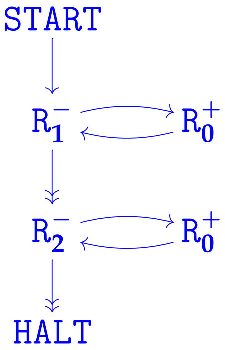
$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 : \mathtt{HALT}$

graphical representation:



Example

registers:

$R_0 \; R_1 \; R_2$

program:

$L_0 : R_1^- \to L_1, L_2$

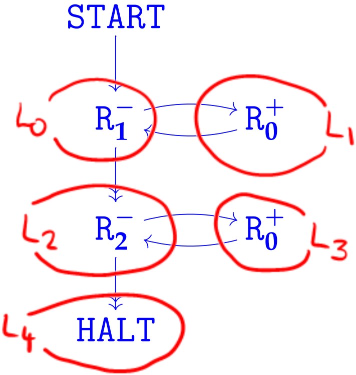
$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 : \mathrm{HALT}$

graphical representation:



Graphical representation is helpful for seeing what function a machine computes...

Example

registers:

$\mathtt{R}_0\ \mathtt{R}_1\ \mathtt{R}_2$

program:

$\mathtt{L}_0 : \mathtt{R}_1^- \to \mathtt{L}_1, \mathtt{L}_2$

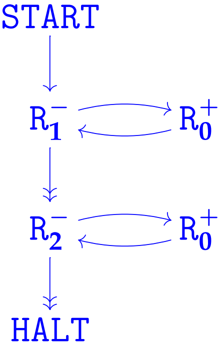
$\mathtt{L}_1 : \mathtt{R}_0^+ \to \mathtt{L}_0$

$\mathtt{L}_2 : \mathtt{R}_2^- \to \mathtt{L}_3, \mathtt{L}_4$

$\mathtt{L}_3 : \mathtt{R}_0^+ \to \mathtt{L}_2$

$\mathtt{L}_4 : \mathtt{HALT}$

graphical representation:



Claim: starting from initial configuration $(0, 0, x, y)$, this machine's computation halts with configuration $(4, x + y, 0, 0)$.

Example

registers:

R_0 R_1 R_2

program:

$L_0 : R_1^- \to L_1, L_2$

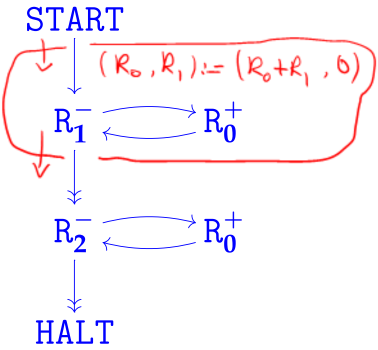
$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 :$ HALT

graphical representation:



Claim: starting from initial configuration $(0, 0, x, y)$, this machine's computation halts with configuration $(4, x + y, 0, 0)$.

Example

registers:

$R_0 \; R_1 \; R_2$

program:

$L_0 : R_1^- \to L_1, L_2$

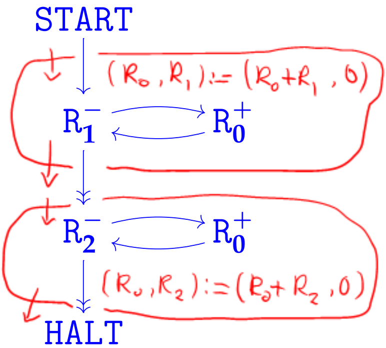
$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

$L_4 : \text{HALT}$

graphical representation:



Claim: starting from initial configuration $(0, 0, x, y)$, this machine's computation halts with configuration $(4, x+y, 0, 0)$.

Partial functions

Register machine computation is deterministic: in any non-halting configuration, the next configuration is uniquely determined by the program.

So the relation between initial and final register contents defined by a register machine program is a partial function...

Partial functions

Register machine computation is deterministic: in any non-halting configuration, the next configuration is uniquely determined by the program.

So the relation between initial and final register contents defined by a register machine program is a partial function…

Definition. A partial function from a set X to a set Y is specified by any subset $f \subseteq X \times Y$ satisfying

$$(x, y) \in f \wedge (x, y') \in f \rightarrow y = y'$$

for all $x \in X$ and $y, y' \in Y$.

Partial functions

ordered pairs $\{(x, y) \mid x \in X \wedge y \in Y\}$

i.e. for all $x \in X$ there is at most one $y \in Y$ with $(x, y) \in f$

Definition. A partial function from a set X to a set Y is specified by any subset $f \subseteq X \times Y$ satisfying

$$(x, y) \in f \wedge (x, y') \in f \rightarrow y = y'$$

for all $x \in X$ and $y, y' \in Y$.

Partial functions

Notation:

- "$f(x) = y$" means $(x, y) \in f$
- "$f(x)\downarrow$" means $\exists y \in Y\,(f(x) = y)$
- "$f(x)\uparrow$" means $\neg\exists y \in Y\,(f(x) = y)$
- $X \rightharpoonup Y$ = set of all partial functions from X to Y
  $X \to Y$ = set of all (total) functions from X to Y

Definition. A partial function from a set X to a set Y is specified by any subset $f \subseteq X \times Y$ satisfying

$$(x, y) \in f \wedge (x, y') \in f \to y = y'$$

for all $x \in X$ and $y, y' \in Y$.

Partial functions

Notation:

- "$f(x) = y$" means $(x, y) \in f$
- "$f(x)\downarrow$" means $\exists y \in Y \, (f(x) = y)$
- "$f(x)\uparrow$" means $\neg\exists y \in Y \, (f(x) = y)$
- $X \rightharpoonup Y$ = set of all partial functions from X to Y
  $X \to Y$ = set of all (total) functions from X to Y

Definition. A partial function from a set X to a set Y is total if it satisfies

$$f(x)\downarrow$$

for all $x \in X$.

Computable functions

Definition. $f \in \mathbb{N}^n \rightharpoonup \mathbb{N}$ is (register machine) computable if there is a register machine M with at least $n + 1$ registers R_0, R_1, ..., R_n (and maybe more) such that for all $(x_1, \ldots, x_n) \in \mathbb{N}^n$ and all $y \in \mathbb{N}$,

> the computation of M starting with $R_0 = 0$, $R_1 = x_1$, ..., $R_n = x_n$ and all other registers set to 0, halts with $R_0 = y$

if and only if $f(x_1, \ldots, x_n) = y$.

Note the [somewhat arbitrary] I/O convention: in the initial configuration registers R_1, ..., R_n store the function's arguments (with all others zeroed); and in the halting configuration register R_0 stores it's value (if any).

Computable functions

Definition. $f \in \mathbb{N}^n \rightharpoonup \mathbb{N}$ is (register machine) computable if there is a register machine M with at least $n+1$ registers R_0, R_1, ..., R_n (and maybe more) such that for all $(x_1, \ldots, x_n) \in \mathbb{N}^n$ and all $y \in \mathbb{N}$,

> the computation of M starting with $R_0 = 0$, $R_1 = x_1$, ..., $R_n = x_n$ and all other registers set to 0, halts with $R_0 = y$

if and only if $f(x_1, \ldots, x_n) = y$.

N.B. there may be many different M that compute the same partial function f.

Example

registers:

$R_0\ R_1\ R_2$

program:

$L_0 : R_1^- \to L_1, L_2$

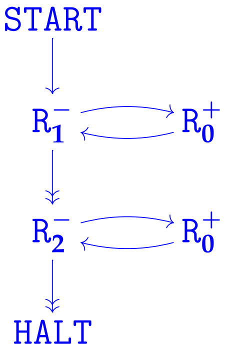
$L_1 : R_0^+ \to L_0$

$L_2 : R_2^- \to L_3, L_4$

$L_3 : R_0^+ \to L_2$

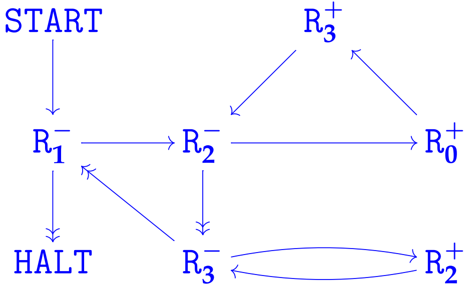
$L_4 : \mathrm{HALT}$

graphical representation:

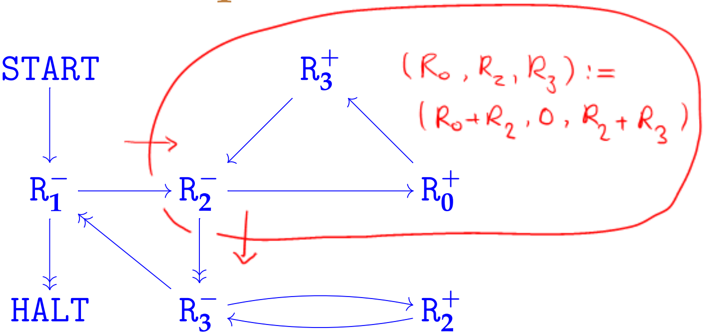


Claim: starting from initial configuration $(0, 0, x, y)$, this machine's computation halts with configuration $(4, x + y, 0, 0)$. So $f(x, y) \triangleq x + y$ is computable.

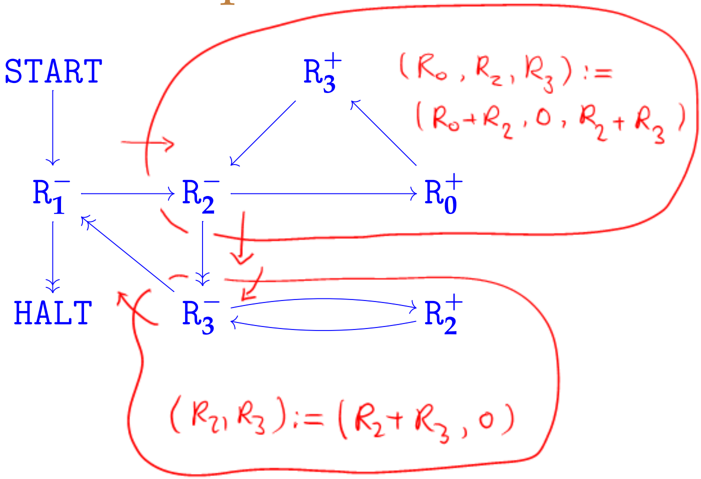
Multiplication $f(x,y) \triangleq xy$ is computable



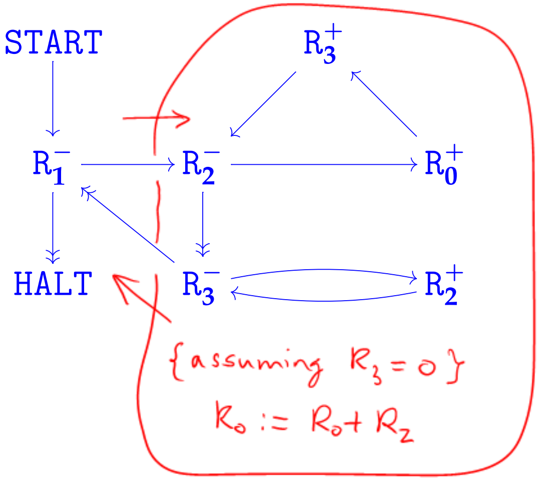
Multiplication $f(x,y) \triangleq xy$ is computable



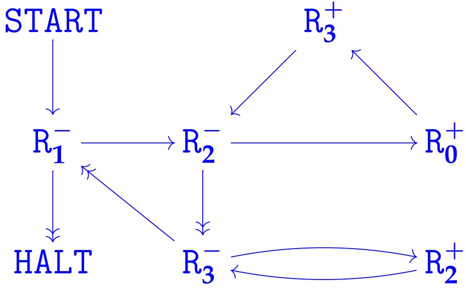
Multiplication $f(x, y) \triangleq xy$ is computable



Multiplication $f(x, y) \triangleq xy$ is computable



Multiplication $f(x, y) \triangleq xy$ is computable



If the machine is started with $(R_0, R_1, R_2, R_3) = (0, x, y, 0)$, it halts with $(R_0, R_1, R_2, R_3) = (xy, 0, y, 0)$.

Further examples

The following arithmetic functions are all computable. (Proof—left as an exercise!)

projection: $p(x, y) \triangleq x$

constant: $c(x) \triangleq n$

truncated subtraction: $x \dot{-} y \triangleq \begin{cases} x - y & \text{if } y \leq x \\ 0 & \text{if } y > x \end{cases}$

Further examples

The following arithmetic functions are all computable.
(Proof—left as an exercise!)

integer division:

$$x \; div \; y \triangleq \begin{cases} integer\ part\ of\ x/y & \text{if } y > 0 \\ 0 & \text{if } y = 0 \end{cases}$$

integer remainder: $x \; mod \; y \triangleq x \dot{-} y(x \; div \; y)$

exponentiation base 2: $e(x) \triangleq 2^x$

logarithm base 2:

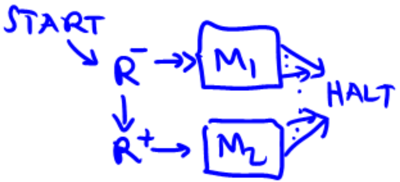
$$\log_2(x) \triangleq \begin{cases} greatest\ y\ such\ that\ 2^y \leq x & \text{if } x > 0 \\ 0 & \text{if } x = 0 \end{cases}$$

W.l.o.g. can use RMs with only one HALT

N.B. interference

Sequential composition $M_1 ; M_2$

IF R=0 THEN M_1 ELSE M_2



WHILE R≠0 DO M
