

Introduction to Graphics

Computer Science Tripos Part 1A/1B
Michaelmas Term 2019/2020

Department of
Computer Science
and Technology
The Computer Laboratory

William Gates Building
15 JJ Thomson Avenue
Cambridge
CB3 0FD

www.cst.cam.ac.uk

This handout includes copies of the slides that will be used in lectures. These notes do not constitute a complete transcript of all the lectures and they are not a substitute for text books. They are intended to give a reasonable synopsis of the subjects discussed, but they give neither complete descriptions nor all the background material.

Selected slides contain a reference to the relevant section in the recommended textbook for this course: *Fundamentals of Computer Graphics* by Marschner & Shirley, CRC Press 2015 (4th edition). The references are in the format [FCG N.M], where N.M is the section number.

Material is copyright © Neil A Dodgson, Peter Robinson & Rafał Mantiuk, 1996-2019, except where otherwise noted.

All other copyright material is made available under the University's licence. All rights reserved.

Introduction to Computer Graphics

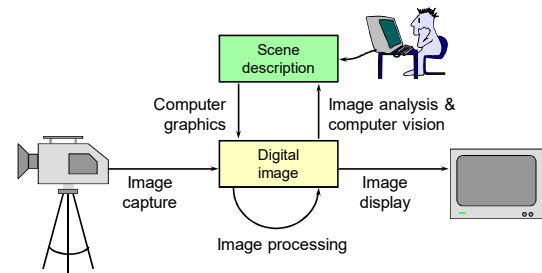

Rafał Mantiuk

www.cl.cam.ac.uk/~rkm38

Eight lectures & two practical tasks
Part IA 75% CST, Part IB 50% CST
Two supervisions suggested
Two exam questions on Paper 3

1

What are Computer Graphics & Image Processing?

2

Why bother with CG & IP?

- ✦ All visual computer output depends on CG
 - ◆ printed output (laser/ink jet/phototypesetter)
 - ◆ monitor (CRT/LCD/OLED/DMD)
 - ◆ all visual computer output consists of real images generated by the computer from some internal digital image
- ✦ Much other visual imagery depends on CG & IP
 - ◆ TV & movie special effects & post-production
 - ◆ most books, magazines, catalogues, brochures, junk mail, newspapers, packaging, posters, flyers

3

Course Structure

- ✦ **Background**
 - ◆ What is an image? Resolution and quantisation. Storage of images in memory. [1 lecture]
- ✦ **Rendering**
 - ◆ Perspective. Reflection of light from surfaces and shading. Geometric models. Ray tracing. [2 lectures]
- ✦ **Graphics pipeline**
 - ◆ Polygonal mesh models. Transformations using matrices in 2D and 3D. Homogeneous coordinates. Projection: orthographic and perspective. Rasterisation. [2 lectures]
- ✦ **Graphics hardware and modern OpenGL**
 - ◆ GPU APIs. Vertex processing. Fragment processing. Working with meshes and textures. [1 lectures]
- ✦ **Human vision, colour and tone mapping**
 - ◆ Colour perception. Colour spaces. Tone mapping [2 lectures]

4

Course books

- ✦ *Fundamentals of Computer Graphics*
 - ◆ Shirley & Marschner
CRC Press 2015 (4th edition)
 - ◆ [FCG 3.1] – reference to section 3.1
- ✦ *Computer Graphics: Principles & Practice*
 - ◆ Hughes, van Dam, McGuire, Sklar et al.
Addison-Wesley 2013 (3rd edition)
- ✦ *OpenGL Programming Guide: The Official Guide to Learning OpenGL Version 4.5 with SPIR-V*
 - ◆ Kessenich, Sellers & Shreiner
Addison Wesley 2016 (7th edition and later)

5

Computer Graphics & Image Processing

- ✦ **Background**
 - ◆ What is an image?
 - ◆ Resolution and quantisation
 - ◆ Storage of images in memory
- ✦ **Rendering**
- ✦ **Graphics pipeline**
- ✦ **Rasterization**
- ✦ **Graphics hardware and modern OpenGL**
- ✦ **Human vision and colour & tone mapping**

6

What is a (digital) image?

- ✦ A digital photograph? (“JPEG”)
- ✦ A snapshot of real-world lighting?

From computing perspective (discrete)

2D array of pixels

- To represent images in memory
- To create image processing software

Image

From mathematical perspective (continuous)

2D function

- To express image processing as a mathematical problem
- To develop (and understand) algorithms

7

Image

- ✦ 2D array of pixels
- ✦ In most cases, each pixel takes 3 bytes: one for each red, green and blue
- ✦ But how to store a 2D array in memory?

row-major

column-major

interleaved, row-major

planar, column-major

8

Stride

- ✦ Calculating the pixel component index in memory
 - ◆ For row-major order (grayscale)

$$i(x, y) = x + y \cdot n_{cols}$$
 - ◆ For column-major order (grayscale)

$$i(x, y) = x \cdot n_{rows} + y$$
 - ◆ For interleaved row-major (colour)

$$i(x, y, c) = x \cdot 3 + y \cdot 3 \cdot n_{cols} + c$$
 - ◆ General case

$$i(x, y, c) = x \cdot s_x + y \cdot s_y + c \cdot s_c$$

where s_x , s_y and s_c are the strides for the x, y and colour dimensions

9

Padded images and stride

- ✦ Sometimes it is desirable to “pad” image with extra pixels
 - ◆ for example when using operators that need to access pixels outside the image border
- ✦ Or to define a region of interest (ROI)

- ✦ How to address pixels for such an image and the ROI?

10

Padded images and stride

$$i(x, y, c) = i_{first} + x \cdot s_x + y \cdot s_y + c \cdot s_c$$

- ✦ For row-major, interleaved
 - ◆ $s_x = ?$
 - ◆ $s_y = ?$
 - ◆ $s_c = ?$

11

Pixel (Picture Element)

- ✦ Each pixel (usually) consist of three values describing the color

(red, green, blue)
- ✦ For example
 - ◆ (255, 255, 255) for white
 - ◆ (0, 0, 0) for black
 - ◆ (255, 0, 0) for red
- ✦ Why are the values in the 0-255 range?
- ✦ How many bytes are needed to store 5MPixel image? (uncompressed)

12

Pixel formats, bits per pixel, bit-depth

- Grayscale – single **color channel**, 8 bits (1 byte)
- Highcolor – $2^{16}=65,536$ colors (2 bytes)

Sample Length:	5	6	5	
Channel Membership:	Red	Green	Blue	
Bit Number:	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0			
RGBAX	R	G	B	X
Sample Length Notation:	5.6.5.0.0			

- Truecolor – $2^{24} = 16,8$ million colors (3 bytes)
- Deepcolor – even more colors (≥ 4 bytes)

Sample Length:	2	10	10	10		
Channel Membership:	None	Red	Green	Blue		
Bit Number:	31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0					
RGBAX		R	G	B	A	X
Sample Length Notation:	10.10.10.0.2					

But why? 13

13

Color banding

- If there are not enough bits to represent color
- Looks worse because of the **Mach band illusion**
- Dithering (added noise) can reduce banding
- Printers but also some LCD displays

Intensity profile 14

14

What is a (computer) image?

- A digital photograph? ("JPEG")
- A snapshot of real-world lighting?

From computing perspective (discrete)

Image

2D array of pixels

- To represent images in memory
- To create image processing software

From mathematical perspective (continuous)

Image

2D function

- To express image processing as a mathematical problem
- To develop (and understand) algorithms

15

15

Image – 2D function

- Image can be seen as a function $I(x,y)$, that gives intensity value for any given coordinate (x,y)

16

16

Sampling an image

- The image can be sampled on a rectangular sampling grid to yield a set of samples. These samples are pixels.

17

17

What is a pixel? (math)

- A pixel is not
 - a box
 - a disk
 - a teeny light
- A pixel is a point
 - it has no dimension
 - it occupies no area
 - it cannot be seen
 - it has coordinates
- A pixel is a **sample**

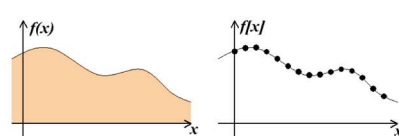

18

From: <http://groups.csail.mit.edu/graphics/classes/6.837/E01/lecture05/lecture05.pdf>

18

Sampling and quantization

- ✦ Physical world is described in terms of continuous quantities
- ✦ But computers work only with discrete numbers
- ✦ Sampling – process of mapping continuous function to a discrete one
- ✦ Quantization – process of mapping continuous variable to a discrete one

19

Computer Graphics & Image Processing 20

- ✦ **Background**
- ✦ **Rendering**
 - ◆ Perspective
 - ◆ Reflection of light from surfaces and shading
 - ◆ Geometric models
 - ◆ Ray tracing
- ✦ **Graphics pipeline**
- ✦ **Graphics hardware and modern OpenGL**
- ✦ **Human vision and colour & tone mapping**

19

22

Perspective in photographs 23

Gates Building – the rounded version (Stanford)

Gates Building – the rectilinear version (Cambridge)

23

Early perspective 24

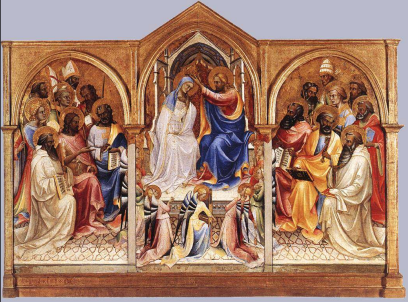

- ✦ Presentation at the Temple
- ✦ Ambrogio Lorenzetti 1342
- ✦ Uffizi Gallery Florence

24

25

Wrong perspective

- ✦ Adoring saints
- ✦ Lorenzo Monaco 1407-09
- ✦ National Gallery London

25

26

Renaissance perspective

- ✦ Geometrical perspective Filippo Brunelleschi 1413
- ✦ Holy Trinity fresco
- ✦ Masaccio (Tommaso di Ser Giovanni di Simone) 1425
- ✦ Santa Maria Novella Florence
- ✦ *De pictura* (On painting) textbook by Leon Battista Alberti 1435

26

27

More perspective

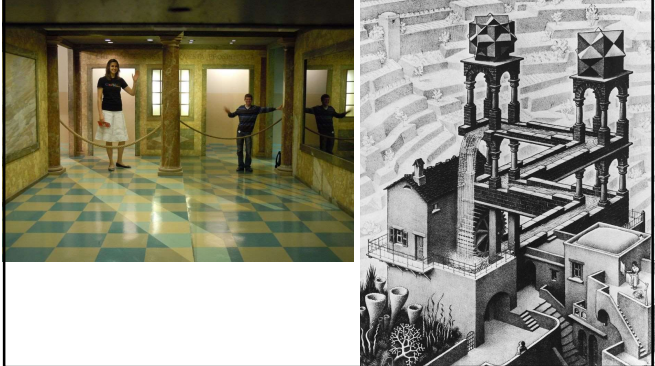

- ✦ The Annunciation with Saint Emidius
- ✦ Carlo Crivelli 1486
- ✦ National Gallery London

27

28

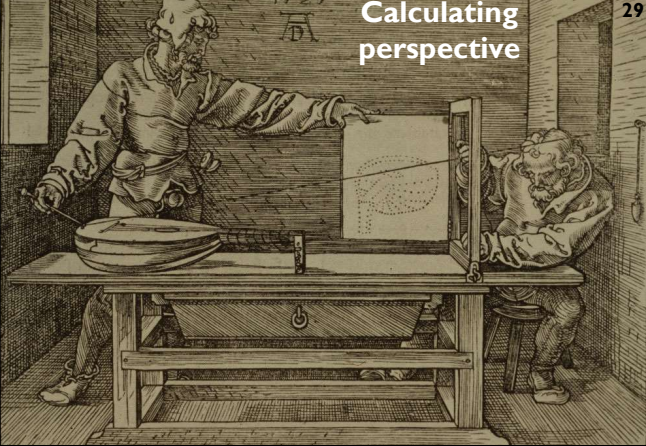

False perspective

28

29

Calculating perspective

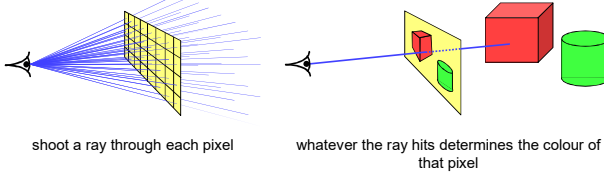

29

30

Ray tracing

- ✦ Identify point on surface and calculate illumination
- ✦ Given a set of 3D objects, shoot a ray from the eye through the centre of every pixel and see what surfaces it hits

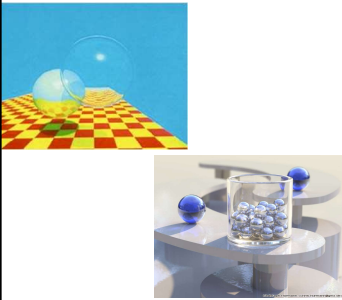

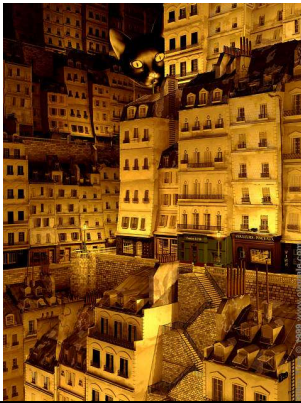

shoot a ray through each pixel

whatever the ray hits determines the colour of that pixel

[FCG 4]

30

Ray tracing: examples

ray tracing easily handles reflection, refraction, shadows and blur

ray tracing is computationally expensive

31

Ray tracing algorithm

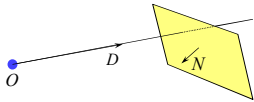

```

select an eye point and a screen plane
FOR every pixel in the screen plane
  determine the ray from the eye through the pixel's centre
  FOR each object in the scene
    IF the object is intersected by the ray
      IF the intersection is the closest (so far) to the eye
        record intersection point and object
      END IF ;
    END FOR ;
  END FOR ;
  set pixel's colour to that of the object at the closest intersection point
END FOR ;
    
```

32

Intersection of a ray with an object 1

◆ plane

ray: $P = O + sD, s \geq 0$
 plane: $P \cdot N + d = 0$

$$s = -\frac{d + N \cdot O}{N \cdot D}$$

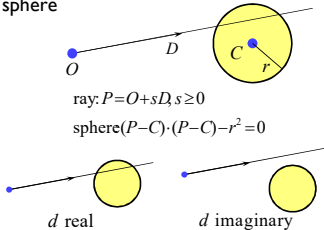

◆ polygon or disc

- intersection the ray with the plane of the polygon
- as above
- then check to see whether the intersection point lies inside the polygon
- a 2D geometry problem (which is simple for a disc)

33

Intersection of a ray with an object 2

◆ sphere

ray: $P = O + sD, s \geq 0$
 sphere: $(P - C) \cdot (P - C) - r^2 = 0$

$$a = D \cdot D$$

$$b = 2D \cdot (O - C)$$

$$c = (O - C) \cdot (O - C) - r^2$$

$$d = \sqrt{b^2 - 4ac}$$

$$s_1 = \frac{-b + d}{2a}$$

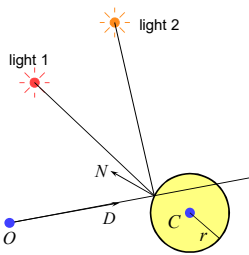

$$s_2 = \frac{-b - d}{2a}$$

◆ cylinder, cone, torus

- all similar to sphere
- try them as an exercise

34

Ray tracing: shading

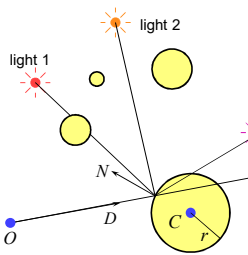

◆ once you have the intersection of a ray with the nearest object you can also:

- calculate the normal to the object at that intersection point
- shoot rays from that point to all of the light sources, and calculate the diffuse and specular reflections off the object at that point
- this (plus ambient illumination) gives the colour of the object (at that point)

35

Ray tracing: shadows

◆ because you are tracing rays from the intersection point to the light, you can check whether another object is between the intersection and the light and is hence casting a shadow

- also need to watch for self-shadowing

36

Ray tracing: reflection

- ◆ if a surface is totally or partially reflective then new rays can be spawned to find the contribution to the pixel's colour given by the reflection
 - this is perfect (mirror) reflection

37

Ray tracing: transparency & refraction

- ◆ objects can be totally or partially transparent
 - this allows objects behind the current one to be seen through it
- ◆ transparent objects can have refractive indices
 - bending the rays as they pass through the objects
- ◆ transparency + reflection means that a ray can split into two parts

38

Illumination and shading

- ✦ Dürer's method allows us to calculate what part of the scene is visible in any pixel
- ✦ But what colour should it be?
- ✦ Depends on:
 - ◆ lighting
 - ◆ shadows
 - ◆ properties of surface material

[FCG 4.5-4.8]

39

How do surfaces reflect light?

perfect specular reflection (mirror)

imperfect specular reflection

diffuse reflection (Lambertian reflection)

the surface of a specular reflector is faceted, each facet reflects perfectly but in a slightly different direction to the other facets

Johann Lambert, 18th century German mathematician

40

Comments on reflection

- ◆ the surface can absorb some wavelengths of light
 - e.g. shiny gold or shiny copper
- ◆ specular reflection has "interesting" properties at glancing angles owing to occlusion of micro-facets by one another

- ◆ plastics are good examples of surfaces with:
 - specular reflection in the light's colour
 - diffuse reflection in the plastic's colour

41

Calculating the shading of a surface

- ◆ gross assumptions:
 - there is only diffuse (Lambertian) reflection
 - all light falling on a surface comes directly from a light source
 - there is no interaction between objects
 - no object casts shadows on any other
 - so can treat each surface as if it were the only object in the scene
 - light sources are considered to be infinitely distant from the object
 - the vector to the light is the same across the whole surface
- ◆ observation:
 - the colour of a flat surface will be uniform across it, dependent only on the colour & position of the object and the colour & position of the light sources

42

Diffuse shading calculation

$I = I_l k_d \cos \theta$
 $= I_l k_d (N \cdot L)$

use this equation to calculate the colour of a pixel

L is a normalised vector pointing in the direction of the light source

N is the normal to the surface

I_l is the intensity of the light source

k_d is the proportion of light which is diffusely reflected by the surface

I is the intensity of the light reflected by the surface

43

Diffuse shading: comments

- ◆ can have different I_l and different k_d for different wavelengths (colours)
- ◆ watch out for $\cos \theta < 0$
 - implies that the light is behind the polygon and so it cannot illuminate this side of the polygon
- ◆ do you use one-sided or two-sided surfaces?
 - one sided: only the side in the direction of the normal vector can be illuminated
 - if $\cos \theta < 0$ then both sides are black
 - two sided: the sign of $\cos \theta$ determines which side of the polygon is illuminated
 - need to invert the sign of the intensity for the back side
- ◆ this is essentially a simple one-parameter (θ) BRDF

44

Specular reflection

★ Phong developed an easy-to-calculate approximation to specular reflection

$I = I_l k_s \cos^n \alpha$
 $= I_l k_s (R \cdot V)^n$

L is a normalised vector pointing in the direction of the light source

R is the vector of perfect reflection

N is the normal to the surface

V is a normalised vector pointing at the viewer

I_l is the intensity of the light source

k_s is the proportion of light which is specularly reflected by the surface

n is Phong's *ad hoc* "roughness" coefficient

I is the intensity of the specularly reflected light

$n=1$ $n=3$ $n=7$ $n=20$ $n=40$

Phong Bui-Tuong, "Illumination for computer generated pictures", CACM, 18(6), 1975, 311-7

45

Examples

diffuse reflection specular reflection

46

Shading: overall equation

- ◆ the overall shading equation can thus be considered to be the ambient illumination plus the diffuse and specular reflections from each light source

$$I = I_a k_a + \sum_i I_l k_d (L_i \cdot N) + \sum_i I_l k_s (R_i \cdot V)^n$$

- the more lights there are in the scene, the longer this calculation will take

47

The gross assumptions revisited

- ◆ diffuse reflection
- ◆ approximate specular reflection
- ◆ no shadows
 - need to do ray tracing or shadow mapping to get shadows
- ◆ lights at infinity
 - can add local lights at the expense of more calculation
 - need to interpolate the L vector
- ◆ no interaction between surfaces
 - cheat!
 - assume that all light reflected off all other surfaces onto a given surface can be amalgamated into a single constant term: "ambient illumination", add this onto the diffuse and specular illumination

48

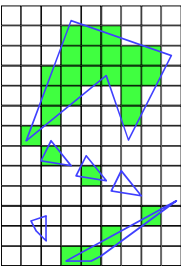

Sampling

◆ we have assumed so far that each ray passes through the centre of a pixel

- i.e. the value for each pixel is the colour of the object which happens to lie exactly under the centre of the pixel

◆ this leads to:

- stair step (jagged) edges to objects
- small objects being missed completely
- thin objects being missed completely or split into small pieces

49

Anti-aliasing

◆ these artefacts (and others) are jointly known as aliasing

◆ methods of ameliorating the effects of aliasing are known as *anti-aliasing*

- in signal processing *aliasing* is a precisely defined technical term for a particular kind of artefact
- in computer graphics its meaning has expanded to include most undesirable effects that can occur in the image
 - this is because the same anti-aliasing techniques which ameliorate true aliasing artefacts also ameliorate most of the other artefacts

50

Sampling in ray tracing

◆ single point

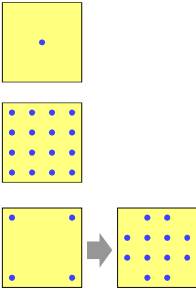

- shoot a single ray through the pixel's centre

◆ super-sampling for anti-aliasing

- shoot multiple rays through the pixel and average the result
- regular grid, random, jittered, Poisson disc

◆ adaptive super-sampling

- shoot a few rays through the pixel, check the variance of the resulting values, if similar enough stop, otherwise shoot some more rays

51

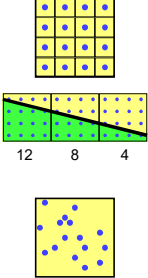

Types of super-sampling I

◆ regular grid

- divide the pixel into a number of sub-pixels and shoot a ray through the centre of each
- problem: can still lead to noticeable aliasing unless a very high resolution sub-pixel grid is used

◆ random

- shoot N rays at random points in the pixel
- replaces aliasing artefacts with noise artefacts
 - the eye is far less sensitive to noise than to aliasing

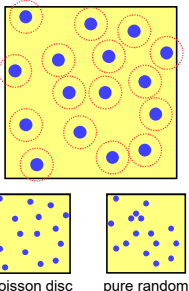

52

Types of super-sampling 2

◆ Poisson disc

- shoot N rays at random points in the pixel with the proviso that no two rays shall pass through the pixel closer than g to one another
- for N rays this produces a better looking image than pure random sampling
- very hard to implement properly

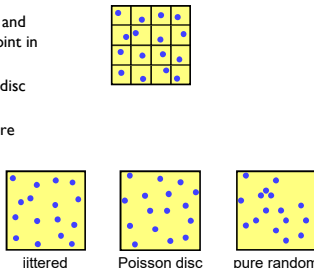

Poisson disc pure random

53

Types of super-sampling 3

◆ jittered

- divide pixel into N sub-pixels and shoot one ray at a random point in each sub-pixel
- an approximation to Poisson disc sampling
- for N rays it is better than pure random sampling
- easy to implement

jittered Poisson disc pure random

54

More reasons for wanting to take multiple samples per pixel

55

- ◆ super-sampling is only one reason why we might want to take multiple samples per pixel
- ◆ many effects can be achieved by distributing the multiple samples over some range
 - called *distributed* ray tracing
 - N.B. *distributed* means distributed over a range of values
- ◆ can work in two ways
 - each of the multiple rays shot through a pixel is allocated a random value from the relevant distribution(s)
 - all effects can be achieved this way with sufficient rays per pixel
 - each ray spawns multiple rays when it hits an object
 - this alternative can be used, for example, for area lights

55

Examples of distributed ray tracing

56

- distribute the samples for a pixel over the pixel area
 - get random (or jittered) super-sampling
 - used for anti-aliasing
- distribute the rays going to a light source over some area
 - allows area light sources in addition to point and directional light sources
 - produces soft shadows with penumbræ
- distribute the camera position over some area
 - allows simulation of a camera with a finite aperture lens
 - produces depth of field effects
- distribute the samples in time
 - produces motion blur effects on any moving objects

56

Anti-aliasing

57

one sample per pixel

multiple samples per pixel

57

Area vs point light source

58

an area light source produces soft shadows

a point light source produces hard shadows

58

Finite aperture

59

left, a pinhole camera
 below, a finite aperture camera
 below left, 12 samples per pixel
 below right, 120 samples per pixel
 note the depth of field blur: only objects at the correct distance are in focus

59

Computer Graphics & Image Processing

60

- ✦ Background
- ✦ Rendering
- ✦ **Graphics pipeline**
 - ◆ Polygonal mesh models
 - ◆ Transformations using matrices in 2D and 3D
 - ◆ Homogeneous coordinates
 - ◆ Projection: orthographic and perspective
- ✦ Rasterization
- ✦ Graphics hardware and modern OpenGL
- ✦ Human vision and colour & tone mapping

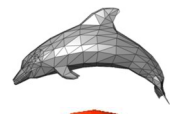

60

Unfortunately...

- ✦ Ray tracing is computationally expensive
 - ◆ used for super-high visual quality
- ✦ Video games and user interfaces need something faster
- ✦ Most real-time applications rely on **rasterization**
 - ◆ Model surfaces as polyhedra – meshes of polygons
 - ◆ Use composition to build scenes
 - ◆ Apply perspective transformation and project into plane of screen
 - ◆ Work out which surface was closest
 - ◆ Fill pixels with colour of nearest visible polygon
- ✦ Modern graphics cards have hardware to support this
- ✦ Ray tracing starts to appear in real-time rendering
 - ◆ The latest generation of GPUs offers accelerated ray-tracing
 - ◆ But it still not as efficient as rasterization

61

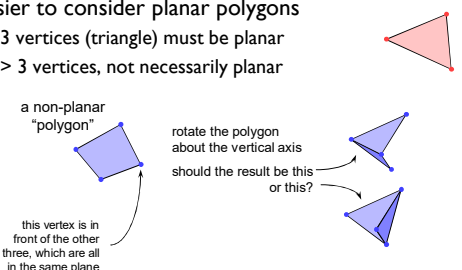

Three-dimensional objects

- ◆ Polyhedral surfaces are made up from meshes of multiple connected polygons
 
- ◆ Polygonal meshes
 - open or closed
 - manifold or non-manifold
- ◆ Curved surfaces
 - must be converted to polygons to be drawn

62

Surfaces in 3D: polygons

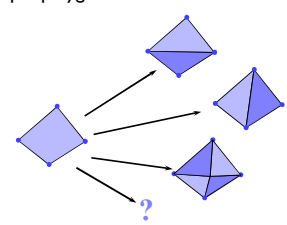

- ✦ Easier to consider planar polygons
 - ◆ 3 vertices (triangle) must be planar
 - ◆ > 3 vertices, not necessarily planar

63

Splitting polygons into triangles

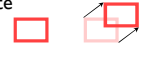

- ◆ Most Graphics Processing Units (GPUs) are optimised to draw triangles
- ◆ Split polygons with more than three vertices into triangles

which is preferable?

64

2D transformations

- ✦ scale
 
- ✦ rotate
 
- ✦ translate
 
- ✦ (shear)
 

✦ why?

- ◆ it is extremely useful to be able to transform predefined objects to an arbitrary location, orientation, and size
- ◆ any reasonable graphics package will include transforms
 - 2D → Postscript
 - 3D → OpenGL

[FCG 6]

65

Basic 2D transformations

- ◆ scale
 - about origin
 - by factor m
$$x' = mx$$

$$y' = my$$
- ◆ rotate
 - about origin
 - by angle θ
$$x' = x \cos \theta - y \sin \theta$$

$$y' = x \sin \theta + y \cos \theta$$
- ◆ translate
 - along vector (x_o, y_o)
$$x' = x + x_o$$

$$y' = y + y_o$$
- ◆ shear
 - parallel to x axis
 - by factor a
$$x' = x + ay$$

$$y' = y$$

66

Matrix representation of transformations 67

scale

- about origin, factor m

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} m & 0 \\ 0 & m \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

rotate

- about origin, angle θ

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

do nothing

- identity

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

shear

- parallel to x axis, factor a

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & a \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

67

Homogeneous 2D co-ordinates 68

- translations cannot be represented using simple 2D matrix multiplication on 2D vectors, so we switch to homogeneous co-ordinates

$$(x, y, w) \equiv \left(\frac{x}{w}, \frac{y}{w}\right)$$
- an infinite number of homogeneous co-ordinates map to every 2D point
- $w=0$ represents a point at infinity
- usually take the inverse transform to be:

$$(x, y) \equiv (x, y, 1)$$

[FCG 6.3]

68

Matrices in homogeneous co-ordinates 69

scale

- about origin, factor m

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} m & 0 & 0 \\ 0 & m & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

rotate

- about origin, angle θ

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta & 0 \\ \sin \theta & \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

do nothing

- identity

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

shear

- parallel to x axis, factor a

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & a & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

69

Translation by matrix algebra 70

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & 0 & x_0 \\ 0 & 1 & y_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

In homogeneous coordinates
 $x' = x + wx_0$ $y' = y + wy_0$ $w' = w$

In conventional coordinates
 $\frac{x'}{w'} = \frac{x}{w} + x_0$ $\frac{y'}{w'} = \frac{y}{w} + y_0$

70

Concatenating transformations 71

- often necessary to perform more than one transformation on the same object
- can concatenate transformations by multiplying their matrices e.g. a shear followed by a scaling:

scale

$$\begin{bmatrix} x'' \\ y'' \\ w'' \end{bmatrix} = \begin{bmatrix} m & 0 & 0 \\ 0 & m & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x' \\ y' \\ w' \end{bmatrix}$$

shear

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & a & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

scale shear

$$\begin{bmatrix} x'' \\ y'' \\ w'' \end{bmatrix} = \begin{bmatrix} m & 0 & 0 \\ 0 & m & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & a & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

both

$$\begin{bmatrix} x'' \\ y'' \\ w'' \end{bmatrix} = \begin{bmatrix} m & ma & 0 \\ 0 & m & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

71

Transformation are not commutative 72

be careful of the order in which you concatenate transformations

rotate then scale

$$\begin{bmatrix} \frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{2} & 0 \\ \frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 2 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

scale then rotate

$$\begin{bmatrix} \frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{2} & 0 \\ \frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 2 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

72

Scaling about an arbitrary point

◆ scale by a factor m about point (x_o, y_o)

- 1 translate point (x_o, y_o) to the origin
- 2 scale by a factor m about the origin
- 3 translate the origin to (x_o, y_o)

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & 0 & -x_o \\ 0 & 1 & -y_o \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

$$\begin{bmatrix} x'' \\ y'' \\ w'' \end{bmatrix} = \begin{bmatrix} m & 0 & 0 \\ 0 & m & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x' \\ y' \\ w' \end{bmatrix}$$

$$\begin{bmatrix} x''' \\ y''' \\ w''' \end{bmatrix} = \begin{bmatrix} 1 & 0 & x_o \\ 0 & 1 & y_o \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x'' \\ y'' \\ w'' \end{bmatrix}$$

$$\begin{bmatrix} x''' \\ y''' \\ w''' \end{bmatrix} = \begin{bmatrix} 1 & 0 & x_o & m & 0 & 0 \\ 0 & 1 & y_o & 0 & m & 0 \\ 0 & 0 & 1 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

Exercise: show how to perform rotation about an arbitrary point

73

3D transformations

◆ 3D homogeneous co-ordinates
 $(x, y, z, w) \rightarrow (\frac{x}{w}, \frac{y}{w}, \frac{z}{w})$

◆ 3D transformation matrices

translation $\begin{bmatrix} 1 & 0 & 0 & t_x \\ 0 & 1 & 0 & t_y \\ 0 & 0 & 1 & t_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$	identity $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$	rotation about x-axis $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta & 0 \\ 0 & \sin\theta & \cos\theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$
scale $\begin{bmatrix} m_x & 0 & 0 & 0 \\ 0 & m_y & 0 & 0 \\ 0 & 0 & m_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$	rotation about z-axis $\begin{bmatrix} \cos\theta & -\sin\theta & 0 & 0 \\ \sin\theta & \cos\theta & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$	rotation about y-axis $\begin{bmatrix} \cos\theta & 0 & \sin\theta & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\theta & 0 & \cos\theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$

74

3D transformations are not commutative

90° rotation about z-axis

90° rotation about x-axis

opposite faces

90° rotation about x-axis

90° rotation about z-axis

75

Model transformation 1

- the graphics package Open Inventor defines a cylinder to be:
 - centre at the origin, $(0,0,0)$
 - radius 1 unit
 - height 2 units, aligned along the y-axis
- this is the only cylinder that can be drawn, but the package has a complete set of 3D transformations
- we want to draw a cylinder of:
 - radius 2 units
 - the centres of its two ends located at $(1,2,3)$ and $(2,4,5)$
 - ✦ its length is thus 3 units
- what transforms are required? and in what order should they be applied?

76

Model transformation 2

✦ order is important:

- ◆ scale first
- ◆ rotate
- ◆ translate last

✦ scaling and translation are straightforward

$$S = \begin{bmatrix} 2 & 0 & 0 & 0 \\ 0 & 1.5 & 0 & 0 \\ 0 & 0 & 2 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

scale from size (2,2,2) to size (4,3,4)

$$T = \begin{bmatrix} 1 & 0 & 0 & 1.5 \\ 0 & 1 & 0 & 3 \\ 0 & 0 & 1 & 4 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

translate centre of cylinder from $(0,0,0)$ to halfway between $(1,2,3)$ and $(2,4,5)$

77

Model transformation 3

✦ rotation is a multi-step process

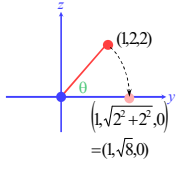

- ◆ break the rotation into steps, each of which is rotation about a principal axis
- ◆ work these out by taking the desired orientation back to the original axis-aligned position
- the centres of its two ends located at $(1,2,3)$ and $(2,4,5)$
- ◆ desired axis: $(2,4,5) - (1,2,3) = (1,2,2)$
- ◆ original axis: y-axis = $(0,1,0)$

78

Model transformation 4

- ◆ desired axis: $(2,4,5)-(1,2,3) = (1,2,2)$
- ◆ original axis: y-axis = $(0,1,0)$
- ◆ zero the z-coordinate by rotating about the x-axis

$$R_1 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos \theta & -\sin \theta & 0 \\ 0 & \sin \theta & \cos \theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

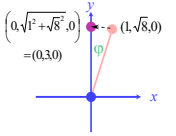

$$\theta = -\arcsin \frac{2}{\sqrt{2^2 + 2^2}}$$

79

Model transformation 5

- ◆ then zero the x-coordinate by rotating about the z-axis
- ◆ we now have the object's axis pointing along the y-axis

$$R_2 = \begin{bmatrix} \cos \phi & -\sin \phi & 0 & 0 \\ \sin \phi & \cos \phi & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\phi = \arcsin \frac{1}{\sqrt{1^2 + \sqrt{8}^2}}$$

80

Model transformation 6

- ✦ the overall transformation is:
 - ◆ first scale
 - ◆ then take the inverse of the rotation we just calculated
 - ◆ finally translate to the correct position

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = T \times R_1^{-1} \times R_2^{-1} \times S \times \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}$$

81

Application: display multiple instances

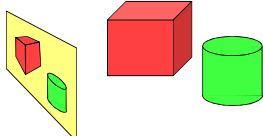

- ◆ transformations allow you to define an object at one location and then place multiple instances in your scene

82

3D ⇔ 2D projection

- ✦ to make a picture
 - ◆ 3D world is projected to a 2D image
 - like a camera taking a photograph
 - the three dimensional world is projected onto a plane

The 3D world is described as a set of (mathematical) objects

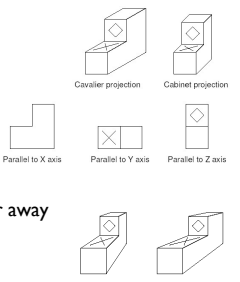

e.g. sphere radius (3,4)
 centre (0,2,9)

e.g. box size (2,4,3)
 centre (7, 2, 9)
 orientation (27°, 156°)

83

Types of projection

- ✦ parallel
 - ◆ e.g. $(x, y, z) \rightarrow (x, y)$
 - ◆ useful in CAD, architecture, etc
 - ◆ looks unrealistic
- ✦ perspective
 - ◆ e.g. $(x, y, z) \rightarrow (\frac{x}{z}, \frac{y}{z})$
 - ◆ things get smaller as they get farther away
 - ◆ looks realistic
 - this is how cameras work

84

Geometry of perspective projection

$x' = x \frac{d}{z}$

 $y' = y \frac{d}{z}$

85

Projection as a matrix operation

$$\begin{bmatrix} x \\ y \\ 1/d \\ z/d \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1/d \\ 0 & 0 & 1/d & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

$x' = x \frac{d}{z}$

 $y' = y \frac{d}{z}$

 $z' = \frac{1}{z}$

This is useful in the z-buffer algorithm where we need to interpolate $1/z$ values rather than z values.

86

Perspective projection with an arbitrary camera

- ◆ we have assumed that:
 - screen centre at $(0,0,d)$
 - screen parallel to xy -plane
 - z -axis into screen
 - y -axis up and x -axis to the right
 - eye (camera) at origin $(0,0,0)$
- ◆ for an arbitrary camera we can either:
 - work out equations for projecting objects about an arbitrary point onto an arbitrary plane
 - transform all objects into our standard co-ordinate system (viewing co-ordinates) and use the above assumptions

87

A variety of transformations

- the modelling transform and viewing transform can be multiplied together to produce a single matrix taking an object directly from object co-ordinates into viewing co-ordinates
- either or both of the modelling transform and viewing transform matrices can be the identity matrix
 - e.g. objects can be specified directly in viewing co-ordinates, or directly in world co-ordinates
- this is a useful set of transforms, not a hard and fast model of how things should be done

88

Model, View, Projection matrices

To position each object in the scene. Could be different for each object.

89

Model, View, Projection matrices

To position all objects relative to the camera

90

Model, View, Projection matrices

The default OpenGL coordinate system is right-handed

To project 3D coordinates to a 2D plane. Note that z coordinate is retained for depth testing.

View (camera) coordinates

Screen coordinates

x and y must be in the range -1 and 1

91

91

All together

Screen coordinates $\begin{bmatrix} x_S \\ y_S \\ z_S \\ w_S \end{bmatrix}$ $= P \cdot V \cdot M \cdot \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}$ 3D world vertex coordinates

x_S/w_S and y_S/w_S must be between -1 and 1

Projection, view and model matrices

92

92

Viewing transformation 1

world co-ordinates $\xrightarrow{\text{viewing transform}}$ viewing co-ordinates

- the problem:
 - to transform an arbitrary co-ordinate system to the default viewing co-ordinate system
- camera specification in world co-ordinates
 - eye (camera) at (e_x, e_y, e_z)
 - look point (centre of screen) at (l_x, l_y, l_z)
 - up along vector (u_x, u_y, u_z)
 - perpendicular to \vec{el}

93

93

Viewing transformation 2

- translate eye point, (e_x, e_y, e_z) , to origin, $(0,0,0)$

$$T = \begin{bmatrix} 1 & 0 & 0 & -e_x \\ 0 & 1 & 0 & -e_y \\ 0 & 0 & 1 & -e_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$
- scale so that eye point to look point distance, $|\vec{el}|$, is distance from origin to screen centre, d

$$S = \begin{bmatrix} \frac{d}{|\vec{el}|} & 0 & 0 & 0 \\ 0 & \frac{d}{|\vec{el}|} & 0 & 0 \\ 0 & 0 & \frac{d}{|\vec{el}|} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$|\vec{el}| = \sqrt{(l_x - e_x)^2 + (l_y - e_y)^2 + (l_z - e_z)^2}$$

94

94

Viewing transformation 3

- need to align line \vec{el} with z-axis
 - first transform e and l into new co-ordinate system

$$e'' = S \times T \times e = 0 \quad l'' = S \times T \times l$$
 - then rotate $e''l''$ into yz-plane, rotating about y-axis

$$R_1 = \begin{bmatrix} \cos \theta & 0 & \sin \theta & 0 \\ 0 & 1 & 0 & 0 \\ -\sin \theta & 0 & \cos \theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\theta = \arccos \frac{l''_z}{\sqrt{l''_x^2 + l''_z^2}}$$

95

95

Viewing transformation 4

- having rotated the viewing vector onto the yz plane, rotate it about the x-axis so that it aligns with the z-axis

$$l''' = R_1 \times l''$$

$$R_2 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos \phi & -\sin \phi & 0 \\ 0 & \sin \phi & \cos \phi & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\phi = \arccos \frac{l'''_z}{\sqrt{l'''_y^2 + l'''_z^2}}$$

96

96

Viewing transformation 5

♦ the final step is to ensure that the up vector actually points up, i.e. along the positive y-axis
 ♦ actually need to rotate the up vector about the z-axis so that it lies in the positive y half of the yz plane

$$\mathbf{u}''' = \mathbf{R}_2 \times \mathbf{R}_1 \times \mathbf{u}$$

$$\mathbf{R}_3 = \begin{bmatrix} \cos \psi & -\sin \psi & 0 & 0 \\ \sin \psi & \cos \psi & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\psi = \arccos \frac{u''''_y}{\sqrt{u''''_x^2 + u''''_y^2}}$$

why don't we need to multiply u by S or T?

u is a vector rather than a point, vectors do not get translated

scaling u by a uniform scaling matrix would make no difference to the direction in which it points

97

Viewing transformation 6

world co-ordinates

→ viewing transform

viewing co-ordinates

♦ we can now transform any point in world co-ordinates to the equivalent point in viewing co-ordinate

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \mathbf{R}_3 \times \mathbf{R}_2 \times \mathbf{R}_1 \times \mathbf{S} \times \mathbf{T} \times \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}$$

♦ in particular: $\mathbf{e} \rightarrow (0,0,0) \quad \mathbf{I} \rightarrow (0,0,d)$
 ♦ the matrices depend only on c, l, and u, so they can be pre-multiplied together

$$\mathbf{M} = \mathbf{R}_3 \times \mathbf{R}_2 \times \mathbf{R}_1 \times \mathbf{S} \times \mathbf{T}$$

98

Transforming normal vectors

♦ Transformation by a nonorthogonal matrix does not preserve angles

Scale

 $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

♦ Since: $N \cdot T = 0$

Normal transform

Vertex position transform

$$N' \cdot T' = (GN) \cdot (MT) = 0$$

Transformed normal and tangent vector

♦ We can find that: $G = (M^{-1})^T$
 ♦ Derivation shown on the visualizer

[FCG 6.2.2]

99

Scene construction

♦ We will build a robot from basic parts

♦ Body transformation
 $M_{body} = ?$

♦ Arm1 transformation
 $M_{arm1} = ?$

♦ Arm 2 transformation
 $M_{arm2} = ?$

Parts

Object coordinates

Final scene

World coordinates

100

Scene construction

♦ Body transformation

$$E_{body} = \text{scale} \begin{bmatrix} 1 \\ 2 \end{bmatrix}$$

$$T_{body} = \text{translate} \begin{bmatrix} x_0 \\ y_0 \end{bmatrix} \cdot \text{rotate}(30^\circ)$$

$$M_{body} = T_{body} E_{body}$$

♦ Arm1 transformation

$$T_{arm1} = \text{translate} \begin{bmatrix} 1 \\ 1.75 \end{bmatrix} \cdot \text{rotate}(-90^\circ)$$

$$M_{arm1} = T_{body} T_{arm1}$$

♦ Arm2 transformation

$$T_{arm2} = \text{translate} \begin{bmatrix} 0 \\ 2 \end{bmatrix} \cdot \text{rotate}(-90^\circ)$$

$$M_{arm2} = T_{body} T_{arm1} T_{arm2}$$

101

Scene Graph

♦ Scene can be drawn by traversing a scene graph:

```

    traverse( node, T_parent ) {
        M = T_parent * node.T * node.E
        node.draw(M)
        for each child {
            traverse( child, T_parent * node.T )
        }
    }
    
```

[FCG 12.2]

102

Introduction to Computer Graphics

- ✦ Background
- ✦ Rendering
- ✦ Graphics pipeline
- ✦ **Rasterization**
- ✦ Graphics hardware and modern OpenGL
- ✦ Human vision and colour & tone mapping

▶ 103

103

Rasterization algorithm(*)

```

Set model, view and projection (MVP) transformations

FOR every triangle in the scene
  transform its vertices using MVP matrices
  IF the triangle is within a view frustum
    clip the triangle to the screen border
    FOR each fragment in the triangle
      interpolate fragment position and attributes between vertices
      compute fragment colour
      IF the fragment is closer to the camera than any pixel drawn so far
        update the screen pixel with the fragment colour
      END IF ;
    END FOR ;
  END IF ;
END FOR ;
    
```

fragment – a candidate pixel in the triangle

(*) simplified

▶ 104

104

Illumination & shading

- ✦ Drawing polygons with uniform colours gives poor results
- ✦ Interpolate colours across polygons

▶ 105

105

Rasterization

- ▶ Efficiently draw (thousands of) triangles
 - ▶ Interpolate vertex attributes inside the triangle
- ▶ **Homogenous barycentric coordinates** are used to interpolate colours, normals, texture coordinates and other attributes inside the triangle

▶ 106

[FCG 2.7]

106

Homogenous barycentric coordinates

- ▶ Find barycentric coordinates of the point (x,y)
- ▶ Given the coordinates of the vertices
- ▶ Derivation in the lecture

$$\alpha = \frac{f_{cb}(x,y)}{f_{cb}(x_a,y_a)} \quad \beta = \frac{f_{ac}(x,y)}{f_{ac}(x_b,y_b)}$$

$f_{ab}(x,y)$ is the implicit line equation:
 $f_{ab}(x,y) = (y_a - y_b)x + (x_b - x_a)y + x_a y_b - x_b y_a$

▶ 107

107

Triangle rasterization

```

for y=y_min to y_max do
  for x=x_min to x_max do
    alpha = f_cb(x,y)/f_cb(x_a,y_a)
    beta = f_ac(x,y)/f_ac(x_b,y_b)
    gamma = 1 - alpha - beta
    if (alpha > 0 and beta > 0 and gamma > 0) then
      c = alpha*a + beta*b + gamma*c
      draw pixels (x,y) with colour c
    end if
  end for
end for
    
```

- ▶ Optimization: the barycentric coordinates will change by the same amount when moving one pixel right (or one pixel down) regardless of the position
- ▶ Precompute increments $\Delta\alpha, \Delta\beta, \Delta\gamma$ and use them instead of computing barycentric coordinates when drawing pixels sequentially

▶ 108

108

Surface normal vector interpolation

- for a polygonal model, interpolate normal vector between the vertices
- Calculate colour (Phong reflection model) for each pixel
- Diffuse component can be either interpolated or computed for each pixel

- N.B. Phong's approximation to specular reflection ignores (amongst other things) the effects of glancing incidence (the Fresnel term)

▶ 109

109

Occlusions (hidden surfaces)

Simple case

More difficult cases

▶ 110

[FCG 8.2.3]

110

Z-Buffer - algorithm

Colour buffer

Depth buffer

- Initialize the depth buffer and image buffer for all pixels
 $colour(x, y) = Background_colour,$
 $depth(x, y) = z_{max}$ // position of the far clipping plane
- For every triangle in a scene do**
 - For every fragment (x, y) in this triangle do**
 - Calculate z for current (x, y)
 - if** ($z < depth(x, y)$) and ($z > z_{min}$) **then**
 - $depth(x, y) = z$
 - $colour(x, y) = fragment_colour(x, y)$

▶ 111

111

View frustum

- Controlled by camera parameters: near-, far-clipping planes and field-of-view

▶ 112

112

Introduction to Computer Graphics

- Background
- Rendering
- Graphics pipeline
- Rasterization
- Graphics hardware and modern OpenGL
 - GPU & APIs
 - OpenGL Rendering pipeline
 - Example OpenGL code
 - GLSL
 - Textures
 - Raster buffers
- Human vision, colour & tone mapping

▶ 113

113

What is a GPU?

- Graphics Processing Unit
- Like CPU (Central Processing Unit) but for processing graphics
- Optimized for floating point operations on large arrays of data
 - Vertices, normals, pixels, etc.

▶ 114

114

What does a GPU do

- ▶ Performs all low-level tasks & a lot of high-level tasks
 - ▶ Clipping, rasterisation, hidden surface removal, ...
 - ▶ Essentially draws millions of triangles very efficiently
 - ▶ Procedural shading, texturing, animation, simulation, ...
 - ▶ Video rendering, de- and encoding, deinterlacing, ...
 - ▶ Physics engines
- ▶ Full programmability at several pipeline stages
 - ▶ fully programmable
 - ▶ but optimized for massively parallel operations

▶ 115

115

What makes GPU so fast?

- ▶ 3D rendering can be very efficiently parallelized
 - ▶ Millions of pixels
 - ▶ Millions of triangles
 - ▶ Many operations executed independently at the same time
- ▶ This is why modern GPUs
 - ▶ Contain between hundreds and thousands of SIMD processors
 - ▶ Single Instruction Multiple Data – operate on large arrays of data
 - ▶ >>400 GB/s memory access
 - ▶ This is much higher bandwidth than CPU
 - ▶ But peak performance can be expected for very specific operations

▶ 116

116

GPU APIs (Application Programming Interfaces)

- | | |
|---|---|
| <p>OpenGL </p> <ul style="list-style-type: none"> ▶ Multi-platform ▶ Open standard API ▶ Focus on general 3D applications <ul style="list-style-type: none"> ▶ Open GL driver manages the resources | <p>DirectX </p> <ul style="list-style-type: none"> ▶ Microsoft Windows / Xbox ▶ Proprietary API ▶ Focus on games <ul style="list-style-type: none"> ▶ Application manages resources |
|---|---|

▶ 117

117

One more API

- ▶ Vulkan – cross platform, open standard
- ▶ Low-overhead API for high performance 3D graphics
- ▶ Compared to OpenGL / DirectX
 - ▶ Reduces CPU load
 - ▶ Better support of multi-CPU-core architectures
 - ▶ Finer control of GPU
- ▶ But
 - ▶ The code for drawing a few primitives can take 1000s line of code
 - ▶ Intended for game engines and code that must be very well optimized

▶ 118

118

And one more

- ▶ Metal (Apple iOS8)
 - ▶ low-level, low-overhead 3D GFX and compute shaders API
 - ▶ Support for Apple A7, Intel HD and Iris, AMD, Nvidia
 - ▶ Similar design as modern APIs, such as Vulkan
 - ▶ Swift or Objective-C API
 - ▶ Used mostly on iOS

▶ 119

119

GPGPU - general purpose computing

- ▶ OpenGL and DirectX are not meant to be used for general purpose computing
 - ▶ Example: physical simulation, machine learning
- ▶ CUDA – Nvidia's architecture for parallel computing
 - ▶ C-like programming language
 - ▶ With special API for parallel instructions
 - ▶ Requires Nvidia GPU
- ▶ OpenCL – Similar to CUDA, but open standard
 - ▶ Can run on both GPU and CPU
 - ▶ Supported by AMD, Intel and NVidia, Qualcomm, Apple, ...

▶ 120

120

GPU and mobile devices

- ▶ **OpenGL ES 1.0-3.2**
 - ▶ Stripped version of OpenGL
 - ▶ Removed functionality that is not strictly necessary on mobile devices
- ▶ **Devices**
 - ▶ iOS: iPhone, iPad
 - ▶ Android phones
 - ▶ PlayStation 3
 - ▶ Nintendo 3DS
 - ▶ and many more

OpenGL ES 2.0 rendering (iOS)

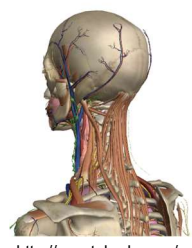

▶ 121

121

WebGL

- ▶ JavaScript library for 3D rendering in a web browser
- ▶ **WebGL 1.0** - based on OpenGL ES 2.0
- ▶ **WebGL 2.0** – based on OpenGL ES 3.0
 - ▶ Chrome and Firefox (2017)
- ▶ Most modern browsers support WebGL
- ▶ Potentially could be used to create 3D games in a browser
 - ▶ and replace Adobe Flash

<http://zygotebody.com/>

▶ 122

122

OpenGL in Java

- ▶ Standard Java API does not include OpenGL interface
- ▶ But several wrapper libraries exist
 - ▶ Java OpenGL – JOGL
 - ▶ Lightweight Java Game Library - LWJGL
- ▶ **We will use LWJGL 3**
 - ▶ Seems to be better maintained
 - ▶ Access to other APIs (OpenCL, OpenAL, ...)
- ▶ **We also need a linear algebra library**
 - ▶ JOML – Java OpenGL Math Library
 - ▶ Operations on 2, 3, 4-dimensional vectors and matrices

▶ 123

123

OpenGL History

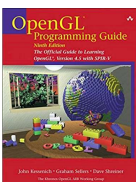

- ▶ Proprietary library IRIS GL by SGI
- ▶ OpenGL 1.0 (1992)
- ▶ OpenGL 1.2 (1998)

137

GLSL - fundamentals

138

Shaders

- ▶ Shaders are small programs executed on a GPU
 - ▶ Executed for each vertex, each pixel (fragment), etc.
- ▶ They are written in GLSL (OpenGL Shading Language)
 - ▶ Similar to C and Java
 - ▶ Primitive (int, float) and aggregate data types (ivec3, vec3)
 - ▶ Structures and arrays
 - ▶ Arithmetic operations on scalars, vectors and matrices
 - ▶ Flow control: if, switch, for, while
 - ▶ Functions

▶ 139

139

Example of a vertex shader

```
#version 330
in vec3 position;           // vertex position in local space
in vec3 normal;            // vertex normal in local space
out vec3 frag_normal;      // fragment normal in world space
uniform mat4 mvp_matrix;    // model-view-projection matrix

void main()
{
    // Typically normal is transformed by the model matrix
    // Since the model matrix is identity in our case, we do not modify normals
    frag_normal = normal;

    // The position is projected to the screen coordinates using mvp_matrix
    gl_Position = mvp_matrix * vec4(position, 1.0);
}
```

▶ 140

Why is this piece of code needed?

140

Data types

- ▶ **Basic types**
 - ▶ float, double, int, uint, bool
 - ▶ **Aggregate types**
 - ▶ float: vec2, vec3, vec4; mat2, mat3, mat4
 - ▶ double: dvec2, dvec3, dvec4; dmat2, dmat3, dmat4
 - ▶ int: ivec2, ivec3, ivec4
 - ▶ uint: uvec2, uvec3, uvec4
 - ▶ bool: bvec2, bvec3, bvec4
- ```
vec3 V = vec3(1.0, 2.0, 3.0); mat3 M = mat3(1.0, 2.0, 3.0,
 4.0, 5.0, 6.0,
 7.0, 8.0, 9.0);
```

▶ 141

141

## Indexing components in aggregate types

- ▶ **Subscripts: rgba, xyzw, stpq (work exactly the same)**
  - ▶ float red = color.r;
  - ▶ float v\_y = velocity.y;
- ▶ but also
  - ▶ float red = color.x;
  - ▶ float v\_y = velocity.g;
- ▶ **With 0-base index:**
  - ▶ float red = color[0];
  - ▶ float m22 = M[1][1]; // second row and column // of matrix M

▶ 142

142

## Swizzling

You can select the elements of the aggregate type:

```
vec4 rgba_color(1.0, 1.0, 0.0, 1.0);
vec3 rgb_color = rgba_color.rgb;
vec3 bgr_color = rgba_color.bgr;
vec3 luma = rgba_color.ggg;
```

▶ 143

143

## Arrays

- ▶ **Similar to C**

```
float lut[5] = float[5](1.0, 1.42, 1.73, 2.0, 2.23);
```
- ▶ **Size can be checked with "length()"**

```
for(int i = 0; i < lut.length(); i++) {
 lut[i] *= 2;
}
```

▶ 144

144

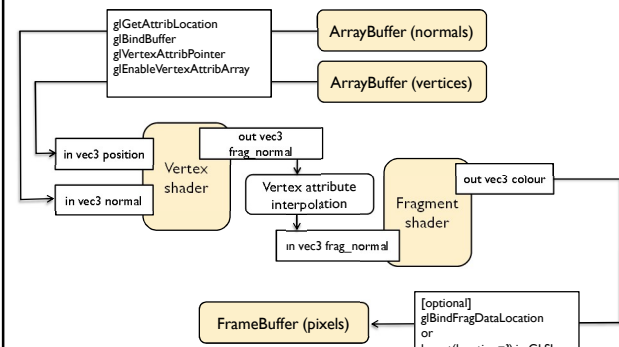

## Storage qualifiers

- ▶ `const` – read-only, fixed at compile time
  - ▶ `in` – input to the shader
  - ▶ `out` – output from the shader
  - ▶ `uniform` – parameter passed from the application (Java), constant for the primitive
  - ▶ `buffer` – shared with the application
  - ▶ `shared` – shared with local work group (compute shaders only)
- ▶ Example: `const float pi=3.14;`

▶ 145

145

## Shader inputs and outputs

▶ 146

146

## GLSL Operators

- ▶ **Arithmetic:** `+`, `-`, `++`, `--`
    - ▶ Multiplication:
      - ▶ `vec3 * vec3` – element-wise
      - ▶ `mat4 * vec4` – matrix multiplication (with a column vector)
  - ▶ **Bitwise (integer):** `<<`, `>>`, `&`, `|`, `^`
  - ▶ **Logical (bool):** `&&`, `||`, `^^`
  - ▶ **Assignment:**

```
float a=0;
a += 2.0; // Equivalent to a = a + 2.0
```
- ▶ See the quick reference guide at: <https://www.opengl.org/documentation/glsl/>

▶ 147

147

## GLSL Math

- ▶ **Trigonometric:**
    - ▶ `radians( deg )`, `degrees( rad )`, `sin`, `cos`, `tan`, `asin`, `acos`, `atan`, `sinh`, `cosh`, `tanh`, `asinh`, `acosh`, `atanh`
  - ▶ **Exponential:**
    - ▶ `pow`, `exp`, `log`, `exp2`, `log2`, `sqrt`, `inversesqrt`
  - ▶ **Common functions:**
    - ▶ `abs`, `round`, `floor`, `ceil`, `min`, `max`, `clamp`, ...
  - ▶ **And many more**
- ▶ See the quick reference guide at: <https://www.opengl.org/documentation/glsl/>

▶ 148

148

## GLSL flow control

```
if(bool) {
 // true
} else {
 // false
}

switch(int_value) {
 case n:
 // statements
 break;
 case m:
 // statements
 break;
 default:
 // statements
}

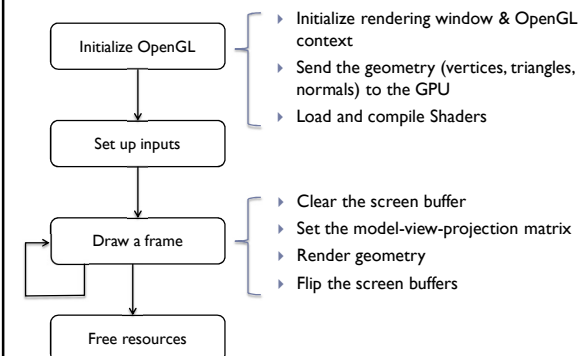

while(n < 10) {
 // statements
}

do {
 // statements
} while (n < 10)
```

▶ 149

149

## Simple OpenGL application - flow

▶ 150

150

## Rendering geometry

- ▶ To render a single object with OpenGL
  1. `glUseProgram()` – to activate vertex & fragment shaders
  2. `glVertexAttribPointer()` – to indicate which Buffers with vertices and normal should be input to fragment shader
  3. `glUniform*()` – to set uniforms (parameters of the fragment/vertex shader)
  4. `glBindTexture()` – to bind the texture
  5. `glBindVertexArray()` – to bind the vertex array
  6. `glDrawElements()` – to queue drawing the geometry
  7. Unbind all objects
- ▶ OpenGLAPI is designed around the idea of a state-machine – set the state & queue drawing command

▶ 151

151

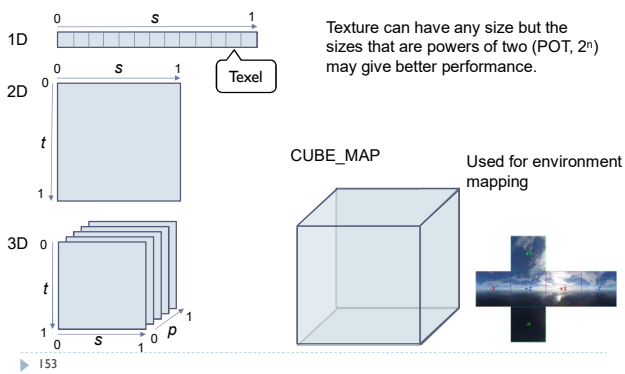

## Textures

▶

152

## (Most important) OpenGL texture types

▶ 153

153

## Texture mapping

- ▶ 1. Define your texture function (image)  $T(u,v)$
- ▶  $(u,v)$  are texture coordinates

▶ 154

154

## Texture mapping

- ▶ 2. Define the correspondence between the vertices on the 3D object and the texture coordinates

▶ 155

155

## Texture mapping

- ▶ 3. When rendering, for every surface point compute texture coordinates. Use the texture function to get texture value. Use as color or reflectance.

▶ 156

156

### Sampling

Texture

Up-sampling  
More pixels than texels  
Values need to be interpolated

Down-sampling  
Fewer pixels than texels  
Values need to be averaged over an area of the texture (usually using a mipmap)

157

157

### Nearest neighbor vs. bilinear interpolation (upsampling)

Nearest neighbour

Pick the nearest texel: D

Bilinear interpolation

Interpolate first along x-axis between AB and CD, then along y-axis between the interpolated points.

158

158

### Texture mapping examples

nearest-neighbour

bilinear

159

159

### Up-sampling

nearest-neighbour

*blocky artefacts*

bilinear

*blurry artefacts*

- if one pixel in the texture map covers several pixels in the final image, you get visible artefacts
- only practical way to prevent this is to ensure that texture map is of sufficiently high resolution that it does not happen

160

160

### Down-sampling

- if the pixel covers quite a large area of the texture, then it will be necessary to average the texture across that area, not just take a sample in the middle of the area

161

161

### Mipmap

- Textures are often stored at multiple resolutions as a mipmap
- Each level of the pyramid is half the size of the lower level
- Mipmap resolution is always power-of-two (1024, 512, 256, 128, ...)
- It provides pre-filtered texture (area-averaged) when screen pixels are larger than the full resolution texels
- Mipmap requires just an additional 1/3 of the original texture size to store
- OpenGL can generate a mipmap with `glGenerateMipmap(GL_TEXTURE_2D)`

This image is an illustration showing only 1/3 increase in storage. Mipmaps are stored differently in the GPU memory.

162

162

### Down-sampling

without area averaging      with area averaging

▶ 163

163

### Texture tiling

- ▶ Repetitive patterns can be represented as texture tiles.
- ▶ The texture folds over, so that
  - ▶  $T(u=1.1, v=0) = T(u=0.1, v=0)$

▶ 164

164

### Multi-surface UV maps

- ▶ A single texture is often used for multiple surfaces and objects

Example from:  
<http://awshub.com/blog/blog/2011/11/01/hi-poly-vs-low-poly/>

▶ 165

165

### Bump (normal) mapping

- ▶ Special kind of texture that modifies surface normal
  - ▶ Surface normal is a vector that is perpendicular to a surface
- ▶ The surface is still flat but shading appears as on an uneven surface
- ▶ Easily done in fragment shaders

From Computer Desktop Encyclopedia  
 Reproduced with permission.  
 © 2001 Intergraph Computer Systems

▶ 166

166

### Displacement mapping

- ▶ Texture that modifies surface
- ▶ Better results than bump mapping since the surface is not flat
- ▶ Requires geometry shaders

▶ 167

167

### Environment mapping

- ▶ To show environment reflected by an object

▶ 168

168

### Environment mapping

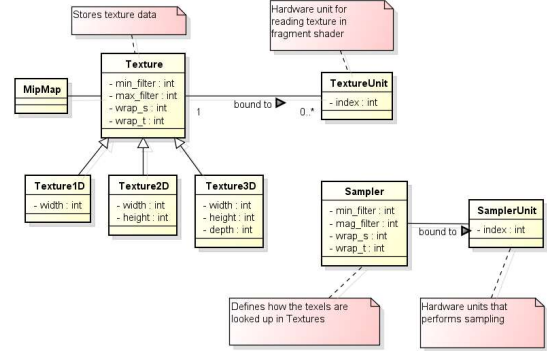

- ▶ Environment cube
- ▶ Each face captures environment in that direction

▶ 169

169

### Texture objects in OpenGL

▶ 170

170

### Texture parameters

```
//Setup filtering, i.e. how OpenGL will interpolate the pixels
when scaling up or down
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER,
GL_LINEAR);
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER,
GL_LINEAR_MIPMAP_NEAREST);

//Setup wrap mode, i.e. how OpenGL will handle pixels outside of
the expected range
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_S,
GL_CLAMP_TO_EDGE);
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_T,
GL_CLAMP_TO_EDGE);
```

▶ 171

171

### Raster buffers (colour, depth, stencil)

▶

172

### Render buffers in OpenGL

|            |               |                |                                                                                     |
|------------|---------------|----------------|-------------------------------------------------------------------------------------|
| Colour:    | GL_FRONT      | GL_BACK        | Four components: RGBA                                                               |
|            | GL_FRONT_LEFT | GL_FRONT_RIGHT | Typically 8 bits per component                                                      |
| In stereo: | GL_BACK_LEFT  | GL_BACK_RIGHT  |                                                                                     |
| Depth:     | DEPTH         |                | To resolve occlusions (see Z-buffer algorithm)<br>Single component, usually >8 bits |
| Stencil:   | STENCIL       |                | To block rendering selected pixels<br>Single component, usually 8 bits.             |

▶ 173

173

### Double buffering

- ▶ To avoid flicker, tearing
- ▶ Use two buffers (rasters):
  - ▶ Front buffer – what is shown on the screen
  - ▶ Back buffer – not shown, GPU draws into that buffer
- ▶ When drawing is finished, swap front- and back-buffers

▶ 174

174

### Triple buffering

- Do not wait for swapping to start drawing the next frame

Get rid of these gaps

Shortcomings

- More memory needed
- Higher delay between drawing and displaying a frame

175

175

### Vertical Synchronization: V-Sync

- Pixels are copied from colour buffer to monitor row-by-row
- If front & back buffer are swapped during this process:
  - Upper part of the screen contains previous frame
  - Lower part of the screen contains current frame
  - Result: tearing artefact
- Solution: When V-Sync is enabled
  - `glfwSwapInterval(1);`
  - `glSwapBuffers()` waits until the last row is copied to the display.

176

176

### No V-Sync vs. V-Sync

177

177

### FreeSync (AMD) & G-Sync (Nvidia)

- Adaptive sync
  - Graphics card controls timing of the frames on the display
  - Can save power for 30fps video of when the screen is static
  - Can reduce lag for real-time graphics

178

178

### Vision, colour and colour spaces

179

179

### The workings of the human visual system

- to understand the requirements of displays (resolution, quantisation and colour) we need to know how the human eye works...

The lens of the eye forms an image of the world on the retina: the back surface of the eye

180

180

### Structure of the human eye

- ▶ the **retina** is an array of light detection cells
- ▶ the **fovea** is the high resolution area of the retina
- ▶ the **optic nerve** takes signals from the retina to the visual cortex in the brain
- ▶ **cornea** and **lens** focus the light on the retina
- ▶ **pupil** shrinks and expands to control the amount of light

See Animagraffs web page for an animated visualization <https://animagraffs.com/human-eye/>

▶ 181

181

### Retina, cones and rods

- ▶ 2 classes of photoreceptors
- ▶ **Cones** are responsible for day-light vision and colour perception
  - ▶ Three types of cones: sensitive to short, **medium** and **long** wavelengths
- ▶ **Rods** are responsible for night vision

▶ 182

182

### Fovea, distribution of photoreceptors

- ▶ the **fovea** is a densely packed region in the centre of the macula
  - ▶ contains the highest density of cones
  - ▶ provides the highest resolution vision

receptors in 1000/mm<sup>2</sup>

▶ 183

183

### Electromagnetic spectrum

- ▶ **Visible light**
  - ▶ Electromagnetic waves of wavelength in the range 380nm to 730nm
  - ▶ Earth's atmosphere lets through a lot of light in this wavelength band
  - ▶ Higher in energy than thermal infrared, so heat does not interfere with vision

▶ 184

184

### Colour

- ▶ There is no physical definition of colour – colour is the result of our perception
- ▶ For emissive displays / objects
  - ▶ colour = perception( spectral\_emission )
- ▶ For reflective displays / objects
  - ▶ colour = perception( illumination \* reflectance )

▶ 185

185

### Reflectance

- ▶ Most of the light we see is reflected from objects
- ▶ These objects absorb a certain part of the light spectrum

#### Spectral reflectance of ceramic tiles

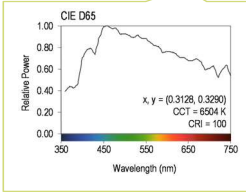

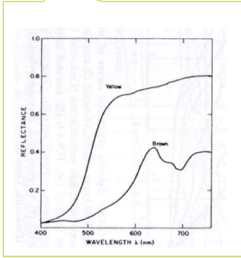

▶ 186

186

### Reflected light

$$L(\lambda) = I(\lambda)R(\lambda)$$

- ▶ Reflected light = illumination × reflectance

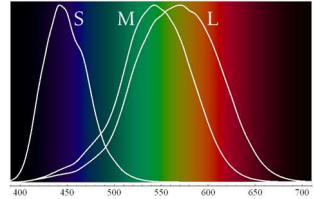

The same object may appear to have different color under different illumination.

▶ 187

187

### Colour vision

- ▶ Cones are the photoreceptors responsible for color vision
- ▶ Only daylight, we see no colors when there is not enough light
- ▶ Three types of cones
  - ▶ S – sensitive to short wavelengths
  - ▶ M – sensitive to medium wavelengths
  - ▶ L – sensitive to long wavelengths

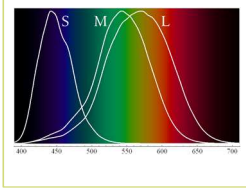

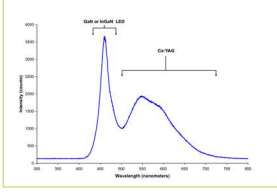

Sensitivity curves – probability that a photon of that wavelength will be absorbed by a photoreceptor. S, M and L curves are normalized in this plot.

▶ 188

188

### Perceived light

- ▶ cone response = sum( sensitivity × reflected light )

Although there is an infinite number of wavelengths, we have only three photoreceptor types to sense differences between light spectra

Formally

$$R_s = \int_{380}^{730} S_s(\lambda) \cdot L(\lambda) d\lambda$$

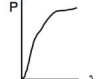

Index S for S-cones

▶ 189

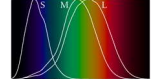

189

### Metamers

- ▶ Even if two light spectra are different, they may appear to have the same colour
- ▶ The light spectra that appear to have the same colour are called **metamers**
- ▶ Example:
 

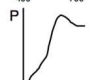

\*

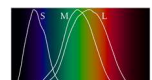

= [L<sub>1</sub>, M<sub>1</sub>, S<sub>1</sub>]

II

\*

= [L<sub>2</sub>, M<sub>2</sub>, S<sub>2</sub>]

▶ 190

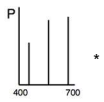

190

### Practical application of metamerism

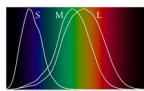

- ▶ Displays do not emit the same light spectra as real-world objects
- ▶ Yet, the colours on a display look almost identical

On the display

\*

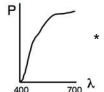

= [L<sub>1</sub>, M<sub>1</sub>, S<sub>1</sub>]

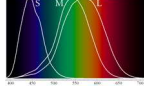

II

In real world

\*

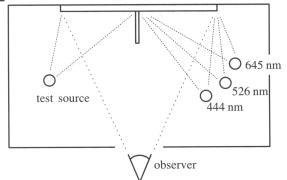

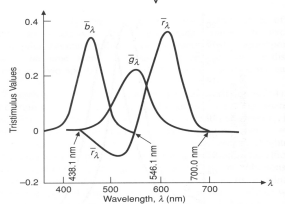

= [L<sub>2</sub>, M<sub>2</sub>, S<sub>2</sub>]

▶ 191

191

### Tristimulus Colour Representation

- ▶ Observation
  - ▶ Any colour can be matched using three linear independent reference colours
  - ▶ May require “negative” contribution to test colour
  - ▶ Matching curves describe the value for matching monochromatic spectral colours of equal intensity
    - ▶ With respect to a certain set of primary colours

▶ 192

192

### Standard Colour Space CIE-XYZ

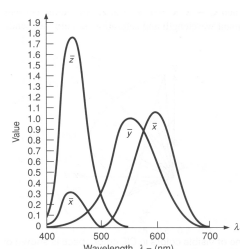

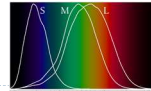

- ▶ CIE Experiments [Guild and Wright, 1931]
  - ▶ Colour matching experiments
  - ▶ Group ~12 people with „normal“ colour vision
  - ▶ 2 degree visual field (fovea only)
- ▶ CIE 2006 XYZ
  - ▶ Derived from LMS color matching functions by Stockman & Sharpe
  - ▶ S-cone response differs the most from CIE 1931
- ▶ CIE-XYZ Colour Space
  - ▶ Goals
    - ▶ Abstract from concrete primaries used in experiment
    - ▶ All matching functions are positive
    - ▶ Primary „Y“ is roughly proportionally to light intensity (luminance)

▶ 193

193

### Standard Colour Space CIE-XYZ

- ▶ Standardized imaginary primaries CIE XYZ (1931)
  - ▶ Could match all physically realizable colour stimuli
  - ▶ Y is roughly equivalent to luminance
    - ▶ Shape similar to luminous efficiency curve
  - ▶ Monochromatic spectral colours form a curve in 3D XYZ-space

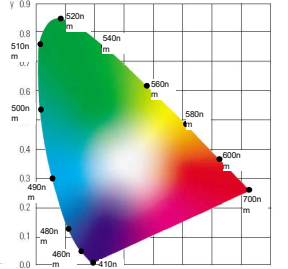

▶ 194

Cone sensitivity curves can be obtained by a linear transformation of CIE XYZ

194

### CIE chromaticity diagram

- ▶ chromaticity values are defined in terms of x, y, z
 
$$x = \frac{X}{X+Y+Z}, \quad y = \frac{Y}{X+Y+Z}, \quad z = \frac{Z}{X+Y+Z} \quad x + y + z = 1$$
  - ▶ ignores luminance
  - ▶ can be plotted as a 2D function
  - ▶ pure colours (single wavelength) lie along the outer curve
  - ▶ all other colours are a mix of pure colours and hence lie inside the curve
  - ▶ points outside the curve do not exist as colours

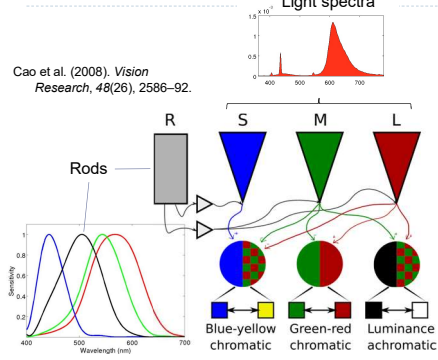

▶ 195

195

### Achromatic/chromatic vision mechanisms

Cao et al. (2008), Vision Research, 48(26), 2586–92.

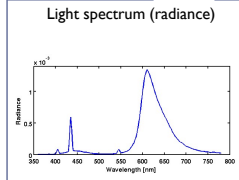

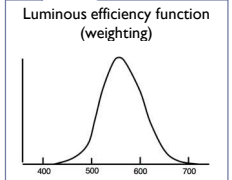

▶ 200

200

### Luminance

- ▶ Luminance – measure of light weighted by the response of the achromatic mechanism. Units: cd/m<sup>2</sup>

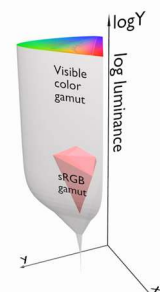

$$L_V = \int_{350}^{700} kL(\lambda)V(\lambda)d\lambda \quad k = \frac{1}{683.002}$$

▶ 201

201

### Visible vs. displayable colours

- ▶ All physically possible and visible colours form a solid in XYZ space
- ▶ Each display device can reproduce a subspace of that space
- ▶ A chromaticity diagram is a slice taken from a 3D solid in XYZ space
- ▶ Colour Gamut – the solid in a colour space
  - ▶ Usually defined in XYZ to be device-independent

▶ 202

202

### Standard vs. High Dynamic Range

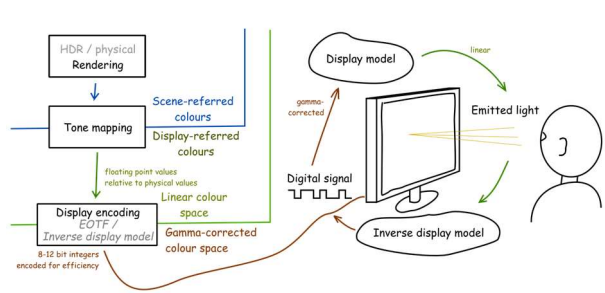

- ▶ **HDR** cameras/formats/displays attempt capture/represent/reproduce (almost) all visible colours
  - ▶ They represent scene colours and therefore we often call this representation *scene-referred*
- ▶ **SDR** cameras/formats/devices attempt to capture/represent/reproduce only colours of a standard sRGB colour gamut, mimicking the capabilities of CRTs monitors
  - ▶ They represent display colours and therefore we often call this representation *display-referred*

▶ 203

203

### From rendering to display

▶ 206

206

### Display encoding for SDR: gamma correction

- ▶ Gamma correction is often used to encode luminance or tri-stimulus color values (RGB) in imaging systems (displays, printers, cameras, etc.)

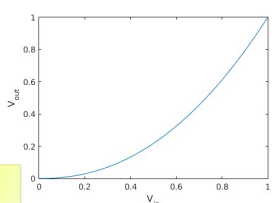

$$V_{out} = a \cdot V_{in}^\gamma$$

Gain

Gamma (usually =2.2)

(relative) Luminance Physical signal

Luma Digital signal (0-1)

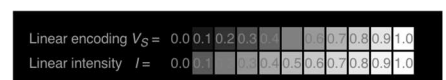

Inverse:  $V_{in} = \left(\frac{1}{a} \cdot V_{out}\right)^{\frac{1}{\gamma}}$

Colour: the same equation applied to red, green and blue colour channels.

▶ 207

207

### Why is gamma needed?

- ▶ Gamma-corrected pixel values give a scale of brightness levels that is more perceptually uniform
- ▶ At least 12 bits (instead of 8) would be needed to encode each color channel without gamma correction
- ▶ And accidentally it was also the response of the CRT gun

▶ 208

208

### Luma – gray-scale pixel value

- ▶ **Luma** - pixel brightness in gamma corrected units
 
$$L' = 0.2126R' + 0.7152G' + 0.0722B'$$
  - ▶  $R'$ ,  $G'$  and  $B'$  are gamma-corrected colour values
  - ▶ Prime symbol denotes gamma corrected
  - ▶ Used in image/video coding
- ▶ Note that relative **luminance** is often approximated with
 
$$L = 0.2126R + 0.7152G + 0.0722B$$

$$= 0.2126(R')^\gamma + 0.7152(G')^\gamma + 0.0722(B')^\gamma$$
  - ▶  $R$ ,  $G$ , and  $B$  are linear colour values
  - ▶ Luma and luminance are different quantities despite similar formulas

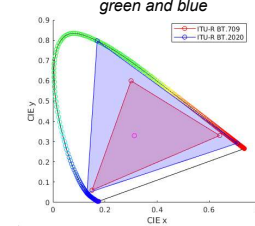

▶ 209

209

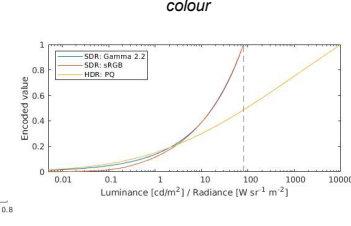

### Standards for display encoding

| Display type           | Colour space | EOTF                | Bit depth |
|------------------------|--------------|---------------------|-----------|
| Standard Dynamic Range | ITU-R 709    | 2.2 gamma / sRGB    | 8 to 10   |
| High Dynamic Range     | ITU-R 2020   | ITU-R 2100 (PQ/HLG) | 10 to 12  |

**Colour space**  
What is the colour of "pure" red, green and blue

**Electro-Optical Transfer Function**  
How to efficiently encode each primary colour

▶ 210

210

## How to transform between RGB colour spaces?

- ▶ From ITU-R 709 RGB to XYZ:

$$\begin{bmatrix} X \\ Y \\ Z \end{bmatrix} = \begin{bmatrix} 0.4124 & 0.3576 & 0.1805 \\ 0.2126 & 0.7152 & 0.0722 \\ 0.0193 & 0.1192 & 0.9505 \end{bmatrix}_{R709toXYZ} \cdot \begin{bmatrix} R \\ G \\ B \end{bmatrix}_{R709}$$

Relative XYZ of the red primary, Relative XYZ of the green primary, Relative XYZ of the blue primary

▶ 211

211

## How to transform between RGB colour spaces?

- ▶ From ITU-R 709 RGB to ITU-R 2020 RGB:

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix}_{R2020} = M_{XYZtoR2020} \cdot M_{R709toXYZ} \cdot \begin{bmatrix} R \\ G \\ B \end{bmatrix}_{R709}$$

- ▶ From ITU-R 2020 RGB to ITU-R 709 RGB:

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix}_{R709} = M_{XYZtoR709} \cdot M_{R2020toXYZ} \cdot \begin{bmatrix} R \\ G \\ B \end{bmatrix}_{R2020}$$

- ▶ Where:

$$M_{R709toXYZ} = \begin{bmatrix} 0.4124 & 0.3576 & 0.1805 \\ 0.2126 & 0.7152 & 0.0722 \\ 0.0193 & 0.1192 & 0.9505 \end{bmatrix} \text{ and } M_{XYZtoR709} = M_{R709toXYZ}^{-1}$$

$$M_{R2020toXYZ} = \begin{bmatrix} 0.6370 & 0.1446 & 0.1689 \\ 0.2627 & 0.6780 & 0.0593 \\ 0.0000 & 0.0281 & 1.0610 \end{bmatrix} \text{ and } M_{XYZtoR2020} = M_{R2020toXYZ}^{-1}$$

▶ 212

212

## Representing colour

- ▶ We need a mechanism which allows us to represent colour in the computer by some set of numbers
  - ▶ A) preferably a small set of numbers which can be quantised to a fairly **small number of bits** each
    - ▶ Linear and gamma corrected RGB, sRGB
  - ▶ B) a set of numbers that are **easy to interpret**
    - ▶ Munsell's artists' scheme
    - ▶ HSV, HLS
  - ▶ C) a set of numbers in a 3D space so that the (Euclidean) distance in that space corresponds to approximately **perceptually uniform** colour differences
    - ▶ CIE Lab, CIE Luv

▶ 213

213

## RGB space

- ▶ Most display devices that output light mix red, green and blue lights to make colour
  - ▶ televisions, CRT monitors, LCD screens
- ▶ Nominally, *RGB* space is a cube
- ▶ The device puts physical limitations on:
  - ▶ the range of colours which can be displayed
  - ▶ the brightest colour which can be displayed
  - ▶ the darkest colour which can be displayed

▶ 214

214

## RGB in XYZ space

- ▶ CRTs and LCDs mix red, green, and blue to make all other colours
- ▶ the red, green, and blue **primaries** each map to a point in CIE xy space
- ▶ any colour within the resulting triangle can be displayed
  - ▶ any colour outside the triangle cannot be displayed
  - ▶ for example: CRTs cannot display very saturated purple, turquoise, or yellow

▶ 215

215

## CMY space

- ▶ printers make colour by mixing coloured inks
- ▶ the important difference between inks (*CMY*) and lights (*RGB*) is that, while lights *emit* light, inks *absorb* light
  - ▶ cyan absorbs red, reflects blue and green
  - ▶ magenta absorbs green, reflects red and blue
  - ▶ yellow absorbs blue, reflects green and red
- ▶ *CMY* is, at its simplest, the inverse of *RGB*
- ▶ *CMY* space is nominally a cube

▶ 216

216

### CMYK space

- ▶ in real printing we use black (key) as well as *CMY*
- ▶ why use black?
  - ▶ inks are not perfect absorbers
  - ▶ mixing  $C + M + Y$  gives a muddy grey, not black
  - ▶ lots of text is printed in black: trying to align  $C, M$  and  $Y$  perfectly for black text would be a nightmare

217

217

### Munsell's colour classification system

- ▶ three axes
  - ▶ hue — the dominant colour
  - ▶ value — bright colours/dark colours
  - ▶ chroma — vivid colours/dull colours
- ▶ can represent this as a 3D graph

218

218

### Munsell's colour classification system

- ▶ any two adjacent colours are a standard "perceptual" distance apart
  - ▶ worked out by testing it on people
  - ▶ a highly irregular space
    - ▶ e.g. vivid yellow is much brighter than vivid blue

invented by Albert H. Munsell, an American artist, in 1905 in an attempt to systematically classify colours

219

219

### Colour spaces for user-interfaces

- ▶ *RGB* and *CMY* are based on the physical devices which produce the coloured output
- ▶ *RGB* and *CMY* are difficult for humans to use for selecting colours
- ▶ Munsell's colour system is much more intuitive:
  - ▶ hue — what is the principal colour?
  - ▶ value — how light or dark is it?
  - ▶ chroma — how vivid or dull is it?
- ▶ computer interface designers have developed basic transformations of *RGB* which resemble Munsell's human-friendly system

220

220

### HSV: hue saturation value

- ▶ three axes, as with Munsell
- ▶ hue and value have same meaning
- ▶ the term "saturation" replaces the term "chroma"

- ◆ designed by Alvy Ray Smith in 1978
- ◆ algorithm to convert *HSV* to *RGB* and back can be found in Foley et al., Figs 13.33 and 13.34

221

221

### HLS: hue lightness saturation

- ▶ a simple variation of *HSV*
  - ◆ hue and saturation have same meaning
  - ◆ the term "lightness" replaces the term "value"
- ▶ designed to address the complaint that *HSV* has all pure colours having the same lightness/value as white
  - ◆ designed by Metrick in 1979
  - ◆ algorithm to convert *HLS* to *RGB* and back can be found in Foley et al., Figs 13.36 and 13.37

222

222

### Perceptually uniformity

- ▶ MacAdam ellipses & visually indistinguishable colours

In CIE xy chromatic coordinates      In CIE u'v' chromatic coordinates

▶ 223

223

### CIE L\*u\*v\* and u'v'

- ▶ Approximately perceptually uniform
- ▶ u'v' chromaticity
 
$$u' = \frac{4X}{X + 15Y + 3Z} = \frac{4x}{-2x + 12y + 3}$$

$$v' = \frac{9Y}{X + 15Y + 3Z} = \frac{9y}{-2x + 12y + 3}$$
- ▶ CIE LUV
 
$$\text{Lightness } L^* = \begin{cases} \left(\frac{29}{3}\right)^3 Y/Y_n, & Y/Y_n \leq \left(\frac{6}{29}\right)^3 \\ 116(Y/Y_n)^{1/3} - 16, & Y/Y_n > \left(\frac{6}{29}\right)^3 \end{cases}$$

$$\text{Chromaticity coordinates } \begin{cases} u^* = 13L^* \cdot (u' - u'_n) \\ v^* = 13L^* \cdot (v' - v'_n) \end{cases}$$

Colours less distinguishable when dark
- ▶ Hue and chroma
 
$$C_{uv} = \sqrt{(u^*)^2 + (v^*)^2}$$

$$h_{uv} = \text{atan2}(v^*, u^*),$$

sRGB in CIE L\*u\*v'

▶ 224

224

### CIE L\*a\*b\* colour space

- ▶ Another approximately perceptually uniform colour space

$$L^* = 116f\left(\frac{Y}{Y_n}\right) - 16$$

$$a^* = 500\left(f\left(\frac{X}{X_n}\right) - f\left(\frac{Y}{Y_n}\right)\right)$$

$$b^* = 200\left(f\left(\frac{Y}{Y_n}\right) - f\left(\frac{Z}{Z_n}\right)\right)$$

Trichromatic values of the white point, e.g.  
 $X_n = 95.047,$   
 $Y_n = 100.000,$   
 $Z_n = 108.883$

$$f(t) = \begin{cases} \sqrt[3]{t} & \text{if } t > \delta^3 \\ \frac{6}{29}t + \frac{4}{29} & \text{otherwise} \end{cases}$$

$$\delta = \frac{6}{29}$$

- ▶ Chroma and hue
 
$$C^* = \sqrt{a^{*2} + b^{*2}}, \quad h^* = \arctan\left(\frac{b^*}{a^*}\right)$$

Adobe RGB gamut in CIE L\*a\*b\* space, top view

▶ 225

225

### Lab space

- ▶ this visualization shows those colours in Lab space which a human can perceive
- ▶ again we see that human perception of colour is not uniform
  - ▶ perception of colour diminishes at the white and black ends of the L axis
  - ▶ the maximum perceivable chroma differs for different hues

▶ 226

### Tone-mapping problem

Moonless Sky  $3 \cdot 10^{-5} \text{ cd/m}^2$       Full Moon  $6 \cdot 10^3 \text{ cd/m}^2$       Sun  $2 \cdot 10^9 \text{ cd/m}^2$

luminance range [cd/m<sup>2</sup>]

human vision simultaneously adapted

conventional display

▶ 228

228

### Why do we need tone mapping?

- ▶ To **reduce dynamic range**
- ▶ To **customize the look** (colour grading)
- ▶ To **simulate human vision** (for example night vision)
- ▶ To **simulate a camera** (for example motion blur)
- ▶ To **adapt** displayed images to a display and **viewing conditions**
- ▶ To make rendered images look **more realistic**
- ▶ To map from **scene- to display-referred** colours

▶ Different tone mapping operators achieve different goals

▶ 229

229

### From scene- to display-referred colours

- ▶ The primary purpose of tone mapping is to transform an image from *scene-referred* to *display-referred* colours

▶ 230

230

### Tone mapping and display encoding

- ▶ Tone mapping is often combined with display encoding

- ▶ Display encoding can model the display and account for
  - ▶ Display contrast (dynamic range), brightness and ambient light levels

▶ 231

231

### sRGB textures and display coding

- ▶ OpenGL offers sRGB textures to automate RGB to/from sRGB conversion
  - ▶ sRGB textures store data in gamma-corrected space
  - ▶ sRGB converted to (linear) RGB on texture look-up (and filtering)
    - ▶ Inverse display coding
  - ▶ RGB to sRGB conversion when writing to sRGB texture
    - ▶ with `glEnable(GL_FRAMEBUFFER_SRGB)`
    - ▶ Forward display coding

▶ 232

232

### Basic tone-mapping and display coding

- ▶ The simplest form of tone-mapping is the exposure/brightness adjustment:
 
$$R_d = \frac{R_s}{L_{white}}$$
  - ▶ R for red, the same for green and blue
  - ▶ No contrast compression, only for a moderate dynamic range
- ▶ The simplest form of display coding is the "gamma"
 
$$R' = (R_d)^{\frac{1}{\gamma}}$$
  - ▶ Prime (') denotes a gamma-corrected value
  - ▶ Typically  $\gamma=2.2$
- ▶ For SDR displays only

▶ 233

233

### Tone-curve

### Scattering of the light in the eye

From: Sekuler, R., and Blake, R. Perception, second ed. McGraw- Hill, New York, 1990

▶ 242

242

### Point Spread Function of the eye

▶ What portion of the light is scattered towards a certain visual angle

▶ To simulate:

- ▶ construct a digital filter
- ▶ convolve the image with that filter

From: Spencer, G. et al. 1995. Proc. of SIGGRAPH. (1995)

▶ 243

243

### Selective application of glare

▶ A) Glare applied to the entire image

$$I_g = I * G$$

Glare kernel (PSF)

▶ Reduces image contrast and sharpness

▶ B) Glare applied only to the clipped pixels

$$I_g = I + I_{clipped} * G - I_{clipped}$$

where  $I_{clipped} = \begin{cases} I & \text{for } I > 1 \\ 0 & \text{otherwise} \end{cases}$

Better image quality

▶ 244

244

### Selective application of glare

A) Glare applied to the entire image

Original image

B) Glare applied to clipped pixels only

▶ 245

245

### Glare (or bloom) in games

- ▶ Convolution with large, non-separable filters is too slow
- ▶ The effect is approximated by a combination of Gaussian filters
  - ▶ Each filter with different "sigma"
- ▶ The effect is meant to look good, not be an accurate model of light scattering
- ▶ Some games simulate a camera rather than the eye

▶ 246

246
