## Natural Language Processing: Part II Overview of Natural Language Processing (L90): ACS

Paula Buttery (materials by Ann Copestake)

Computer Laboratory University of Cambridge

October 2019

## Outline of today's lecture

#### Lecture 1: Introduction

Overview of the course Why NLP is hard

Scope of NLP

A sample application: sentiment classification

NLP subtasks

#### Part II / ACS / CUED

- Part II Paper 10 Unit of Assessment
  - 12 lectures (Paula Buttery, Ryan Cotterell)
  - no supervisions;
  - Assessment by practical tasks (Simone Teufel): 1) sentiment analysis; 2) text understanding question answering system;

#### Part II / ACS / CUED

- Part II Paper 10 Unit of Assessment
  - 12 lectures (Paula Buttery, Ryan Cotterell)
  - no supervisions;
  - Assessment by practical tasks (Simone Teufel): 1) sentiment analysis; 2) text understanding question answering system;
- ► ACS L90
  - Overview of NLP: other modules go into much greater depth: L90 intended for people with no substantial background in NLP.
  - Same 12 lectures as Part II
  - Extended practical (Andreas Vlachos)

#### Part II / ACS / CUED

- Part II Paper 10 Unit of Assessment
  - ▶ 12 lectures (Paula Buttery, Ryan Cotterell)
  - no supervisions;
  - Assessment by practical tasks (Simone Teufel): 1) sentiment analysis; 2) text understanding question answering system;
- ► ACS L90
  - Overview of NLP: other modules go into much greater depth: L90 intended for people with no substantial background in NLP.
  - Same 12 lectures as Part II
  - Extended practical (Andreas Vlachos)
- CUED
  - Same 12 lectures as Part II
  - Same practical as ACS (possibly different marking criteria
    - please contact Kate Knill)

#### Also note:

- Lecture notes in batches.
- No notes for lecture 12: can tailor this session to student interests
- Slides: on web page (in advance where possible), but possible (slight) differences to slides used in lecture.
- Glossary in lecture notes.
- Webpage with links to demos etc.
- Recommended Book: Jurafsky and Martin (2008).
- Linguistics background: Bender (2013).

### NLP and linguistics

NLP: the computational modelling of human language.

- 1. Morphology the structure of words: lecture 2.
- 2. Syntax the way words are used to form phrases: lectures 3, 4 and 5.
- 3. Semantics
  - Compositional semantics the construction of meaning based on syntax: lecture 6.
  - ► Lexical semantics the meaning of individual words: lecture 7, 8 and 9 (sort of).
- 4. Pragmatics meaning in context: lecture 10.
- 5. Language generation lecture 11.
- 6. Some current research lecture 12.

Lecture 1: Introduction

Why NLP is hard

## Querying a knowledge base

#### User query:

Has my order number 4291 been shipped yet?

#### Database:

#### **ORDER**

Order number	Date ordered	Date shipped
4290	2/2/13	2/2/13
4291	2/2/13	2/2/13
4292	2/2/13	

**USER:** Has my order number 4291 been shipped yet?

**DB QUERY:** order(number=4291,date\_shipped=?)

RESPONSE: Order number 4291 was shipped on 2/2/13

## Why is this difficult?

# Similar strings mean different things, different strings mean the same thing:

- 1. How fast is the TZ?
- 2. How fast will my TZ arrive?
- 3. Please tell me when I can expect the TZ I ordered.

- ▶ Do you sell Sony laptops and disk drives?
- ▶ Do you sell (Sony (laptops and disk drives))?
- Do you sell (Sony laptops) and disk drives)?

## Why is this difficult?

## Similar strings mean different things, different strings mean the same thing:

- 1. How fast is the TZ?
- 2. How fast will my TZ arrive?
- Please tell me when I can expect the TZ I ordered.

- ▶ Do you sell Sony laptops and disk drives?
- ▶ Do you sell (Sony (laptops and disk drives))?
- Do you sell (Sony laptops) and disk drives)?

Lecture 1: Introduction
Why NLP is hard

#### Wouldn't it be better if ...?

The properties which make natural language difficult to process are essential to human communication:

- Flexible
- Learnable but compact
- Emergent, evolving systems

Synonymy and ambiguity go along with these properties.

Natural language communication can be indefinitely precise:

- Ambiguity is mostly local (for humans)
- Semi-formal additions and conventions for different genres

```

```

#### Wouldn't it be better if ...?

The properties which make natural language difficult to process are essential to human communication:

- Flexible
- Learnable but compact
- Emergent, evolving systems

Synonymy and ambiguity go along with these properties.

Natural language communication can be indefinitely precise:

- Ambiguity is mostly local (for humans)
- Semi-formal additions and conventions for different genres

## Some NLP applications

- spelling and grammar checking
- predictive text
- optical character recognition (OCR)
- augmentative and alternative communication
- machine aided translation
- lexicographers' tools

- information retrieval
- document classification
- document clustering
- information extraction
- sentiment classification
- text mining

## Some specialities of the NLIP group ...

- question answering
- summarization
- automated exam marking
- automated language teaching
- dialogue systems

- syntactic parsing
- semantic parsing (and generation)
- ethics and bias in NLP
- machine learning for NLP

## Opinion mining: what do they think about me?

- ► Task: scan documents (webpages, tweets etc) for positive and negative opinions on people, products etc.
- Find all references to entity in some document collection: list as positive, negative (possibly with strength) or neutral.
- Fine-grained classification:
   e.g., for phone, opinions about: design, performance,
   battery life . . .
- Construct summary report plus examples (text snippets).

<sup>-</sup> Lecture 1: Introduction

<sup>☐</sup> A sample application: sentiment classification

The iPhone 8 has Apple's latest and best processor. The six-core A11 Bionic has two high-performance cores and four power-efficient cores and is apparently the most powerful so far because it can use a combination of all six at once.

Performance was excellent, but I struggled to see a real difference in day-to-day speed compared to the iPhone 7. But what I'm very pleased to be able to report is that Apple has finally improved battery life for the 4.7in iPhone.

We're not talking a two-day battery here, but the iPhone 8 lasted just over 26 hours . . .

<sup>-</sup> Lecture 1: Introduction

<sup>-</sup> Lecture 1: Introduction

A sample application: sentiment classification

#### Sentiment classification: the research task

- Full task: information retrieval, cleaning up text structure, named entity recognition, identification of relevant parts of text. Evaluation by humans.
- Research task: preclassified documents, topic known, opinion in text along with some straightforwardly extractable score.
- Movie review corpus (Pang et al 2002): strongly positive or negative reviews from IMDb, 50:50 split, with rating score.

<sup>-</sup> Lecture 1: Introduction

<sup>☐</sup> A sample application: sentiment classification

Rating: 9/10

Ooooo. Scary.

The old adage of the simplest ideas being the best is once again demonstrated in this, one of the most entertaining films of the early 80's, and almost certainly Jon Landis' best work to date. The script is light and witty, the visuals are great and the atmosphere is top class. Plus there are some great freeze-frame moments to enjoy again and again. Not forgetting, of course, the great transformation scene which still impresses to this day.

- Lecture 1: Introduction

A sample application: sentiment classification

## Bag of words technique

- Treat the reviews as collections of individual words.
- Classify reviews according to positive or negative words.
- Could use word lists prepared by humans, but machine learning based on a portion of the corpus (training set) is preferable.
- Use human rankings for training and evaluation.
- ▶ Pang et al, 2002: Chance success is 50% (corpus artificially balanced), bag-of-words gives 80%.

## Some sources of errors for bag-of-words

Negation:

Ridley Scott has never directed a bad film.

- Overfitting the training data: e.g., if training set includes a lot of films from before 2005, Ridley may be a strong positive indicator, ('Alien,' 'Thelma & Louise,' 'Gladiator,' 'Black Hawk Down') but then we test on reviews for 'Kingdom of Heaven'?
- Comparisons and contrasts.

<sup>-</sup> Lecture 1: Introduction

A sample application: sentiment classification

#### Contrasts in the discourse

This film should be brilliant. It sounds like a great plot, the actors are first grade, and the supporting cast is good as well, and Stallone is attempting to deliver a good performance. However, it can't hold up.

Lecture 1: Introduction

A sample application: sentiment classification

#### More contrasts

AN AMERICAN WEREWOLF IN PARIS is a failed attempt...Julie Delpy is far too good for this movie. She imbues Serafine with spirit, spunk, and humanity. This isn't necessarily a good thing, since it prevents us from relaxing and enjoying AN AMERICAN WEREWOLF IN PARIS as a completely mindless, campy entertainment experience. Delpy's injection of class into an otherwise classless production raises the specter of what this film could have been with a better script and a better cast ... She was radiant, charismatic, and effective ...

Lecture 1: Introduction

A sample application: sentiment classification

- Lecture 1: Introduction

A sample application: sentiment classification

## Doing sentiment classification 'properly'?

- Morphology, syntax and compositional semantics: who is talking about what, what terms are associated with what, tense . . .
- Lexical semantics: are words positive or negative in this context? Word senses (e.g., spirit)?
- Pragmatics and discourse structure: what is the topic of this section of text? Pronouns and definite references.
- Getting all this to work well on arbitrary text is very hard.
- Ultimately the problem is Al-complete, but can we do well enough for NLP to be useful?

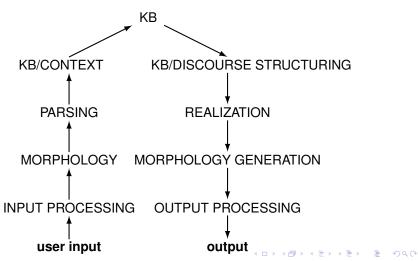

#### NLP subtasks

- input preprocessing: speech recognizer, text preprocessor or gesture recognizer.
- morphological analysis (2)
- part of speech tagging (3)
- parsing: this includes syntax and compositional semantics (4, 5, 6)
- disambiguation, inference (6, 7, 8, 9)
- context processing (10)
- discourse structuring (11)
- realization (11)
- morphological generation (2)
- output processing: text-to-speech, text formatter, etc.

∟NLP subtasks

# Subtasks in natural language interface to a knowledge base

#### General comments

- Even 'simple' applications might need complex knowledge sources.
- Applications cannot be 100% perfect.
- ▶ Applications that are < 100% perfect can be useful.
- Aids to humans are easier than replacements for humans.
- NLP interfaces compete with non-language approaches.
- Typically: shallow processing on arbitrary input or deep processing on narrow domains.
- Limited domain systems require expensive expertise to port or large amounts of (expensive) data.
- External influences on NLP are very important.
