

# Common Protocols

An Engineering Approach to Computer Networking

## The grand finale

- Previous chapters presented principles, but not protocol details
  - ◆ these change with time
  - ◆ real protocols draw many things together
- Overview of real protocols
  - ◆ standards documents are the final resort
- Three sets of protocols
  - ◆ telephone
  - ◆ Internet
  - ◆ ATM

## Telephone network protocols

	<i>Data Plane</i>	<i>Control Plane (SS7)</i>
<b>App</b>	Voice/Fax	ASE/ISDN-UP TCAP
<b>Session</b>		
<b>Transport</b>		
<b>Network</b>		SCCP/MTP-3
<b>Datalink</b>	Sonet/PDH	MTP-2
<b>Physical</b>	Many	MTP-1

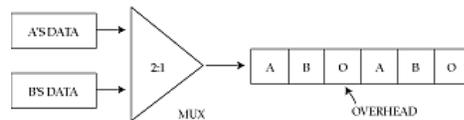

## Traditional digital transmission

- Long distance trunks carry multiplexed calls
- Standard multiplexing levels
- Digital transmission hierarchy

	U S and Japan		
Multiplexing level	Name	# calls	Rate (Mbps)
1	DS1	24	1.544
2	DS2	96	6.312
3	DS3	672	44.736
4	DS4	4032	274.176

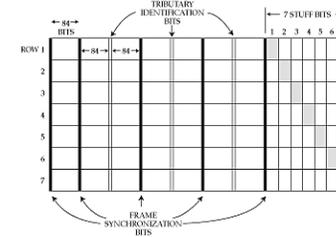

## Plesiochronous hierarchy

- Plesiochronous = nearly synchronous
- Tight control on deviation from synchrony
- What if stream runs a little faster or slower?
- Need *justification*

## Justification

- Output runs a bit faster always
- Overhead identifies bits from a particular stream
- If a stream runs faster, use overhead to identify it
- Overhead used everywhere except at first level (DS1)

## Problems with plesiochrony

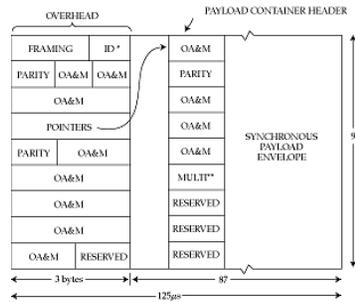

- Incompatible hierarchies around the world
- Data is spread out! Hard to extract a single call
- Cannot switch bundles of calls

## Synchronous Digital Hierarchy

- All levels are synchronous
- Justification uses pointers

Data Rate (Mbps)	US Name
1 51.84	OC-1
2 155.52	OC-3
3 466.56	OC-9
4 622.08	OC-12
5 933.12	OC-18
6 1244.16	OC-24
8 1866.24	OC-36
9 2488.32	OC-48
9953.28	OC-192

## SDH (SONET) frame

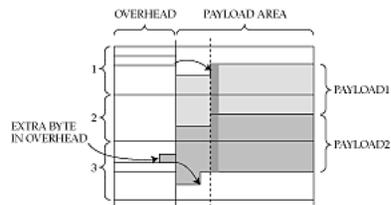

\*ID - IDENTIFIES THE OC-N NUMBER (1...N) IN AN OC-N FRAME  
 \*\*MULTI - INDICATES THAT PAYLOAD SPANS MULTIPLE PAYLOAD ENVELOPES

## SDH

- 9 rows, 90 columns
- Each payload container (SPE) served in 125 microseconds
- One byte = 1 call
- All overhead is in the headers
- Pointers for justification
  - ◆ if sending too fast, use a byte in the overhead, increasing sending rate
  - ◆ if sending too slow, skip a byte and move the pointer
  - ◆ can always locate a payload envelope, and thus a call within it => cheaper add drop mux

## SDH justification

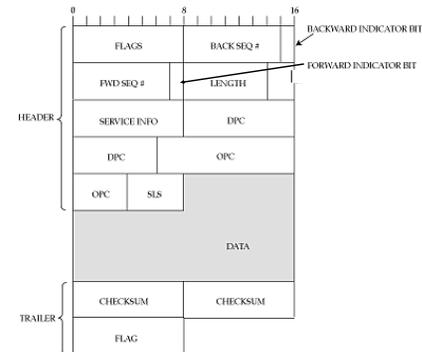

## Signaling System 7 (SS7)

OSI layer name	SS7 layer name	Functionality	Internet example
Application	Application Service Element	Application	FTP
	Transaction Capabilities Application part	RPC	RPC
Transport	Signaling Connection Control Part	Connections, sequence numbers, segmentation and reassembly, flow control	TCP
Network	Message Transfer Part 3 (MTP-3)	Routing	IP
Datalink	MTP-2	Framing, link-level error detection and retransmission	Ethernet
Physical	MTP-1	Physical bit transfer	Ethernet

## SS7 example

- Call forwarding
  - To register
    - ◆ call special number
    - ◆ connects to ASE
    - ◆ authenticates user, stores forwarding number in database
  - On call arrival
    - ◆ call setup protocol checks database for forwarding number
    - ◆ if number present, reroutes call
- SS7 provides all the services necessary for communication and coordination between registry ASE, database, and call setup entity

## MTP Header

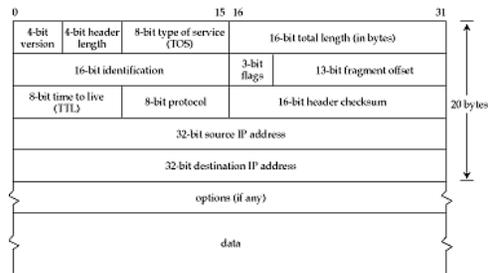

## Internet stack

	<i>Data Plane</i>	<i>Control Plane</i>
<b>App</b>	HTTP	RSVP/OSPF
<b>Session</b>	Sockets/Streams	
<b>Transport</b>	TCP/UDP	
<b>Network</b>	IP	IP/ICMP
<b>Datalink</b>	Many	Many
<b>Physical</b>	Many	Many

## IP

- Unreliable
- Best effort
- End-to-end
- IP on everything- interconnect the world

## IP

## Fragmentation

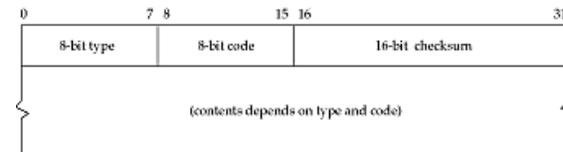

- IP can fragment, reassemble at receiver
- Fragment offset field
- More fragments flag and Don't fragment flag
- Reassembly lockup
  - ◆ decrement timer and drop when it reaches 0
- Fragmentation is harmful
  - ◆ extra work
  - ◆ lockup
  - ◆ error multiplication
- Path MTU discovery
  - ◆ send large pkt with Don't fragment set
  - ◆ if error, try smaller

## IP fields

- TTL
  - ◆ decremented on each hop
  - ◆ decremented every 500 ms at endpt
  - ◆ terminates routing loops
- Traceroute
  - ◆ if router decrements to 0, send ICMP error packet
  - ◆ source sends packets with increasing TTL and waits for errors
- Options
  - ◆ record route
  - ◆ timestamp
  - ◆ loose source routing

## ICMP

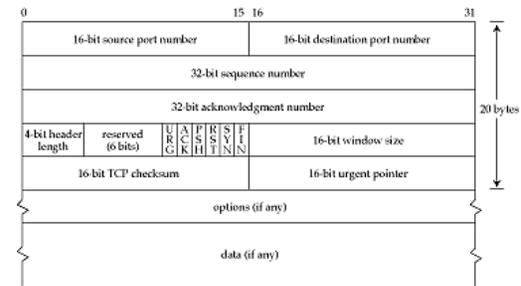

- Destination unreachable
- Source quench
- Redirect
- Router advertisement
- Time exceeded (TTL)
- Fragmentation needed, but Dont frag flag set

## TCP

- Multiplexed
- Duplex
- Connection-oriented
- Reliable
- Flow-controlled
- Byte-stream

## TCP

## Fields

- Port numbers
- Sequence and ack number
- Header length
- Window size
  - ◆ 16 bits => 64 Kbytes (more with scaling)
  - ◆ receiver controls the window size
  - ◆ if zero, need sender persistence
  - ◆ silly window syndrome
- Checksum
- Urgent pointer
- Options
  - ◆ max segment size

## HTTP

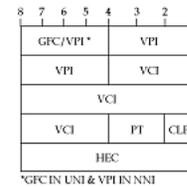

- Request response
- Protocol is simple, browser is complex
- Address space encapsulation
- Request types
  - ◆ GET
  - ◆ HEAD
  - ◆ POST
- Response
  - ◆ status
  - ◆ headers
  - ◆ body

## ATM stack

	<i>Data Plane</i>	<i>Control Plane</i>
<b>Application</b>		UNI/PNNI
<b>Application</b>		Q.2931
<b>Session</b>		
<b>Transport</b>		SSCOP
<b>Network</b>	AAL1-5	S-AAL (AAL5)
<b>Data Link</b>	ATM	ATM
<b>Physical</b>	Many	Many

## ATM

- Connection-oriented
- In-sequence
- Unreliable
- Quality of service assured

## Virtual paths

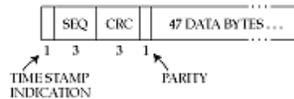

- High order bits of VCI
- All VCIs in a VP share path and resource reservation
- Saves table space in switches
  - ◆ faster lookup
- Avoids signaling
- May waste resources
- Dynamic renegotiation of VP capacity may help
- Set of virtual paths defines a *virtual private network*

## AAL

- Was supposed to provide “rest of stack”
- Scaled back
- 4 versions: 1, 2, 3/4, 5
- Only 1, 3/4 and 5 important in practice

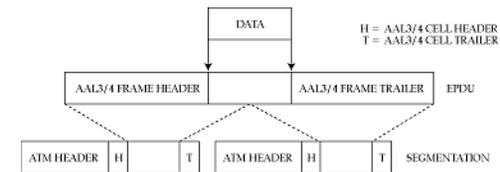

## AAL 1

- For synchronous apps
  - provides timestamps and clocking
  - sequencing
  - always CBR
  - FEC in data bytes

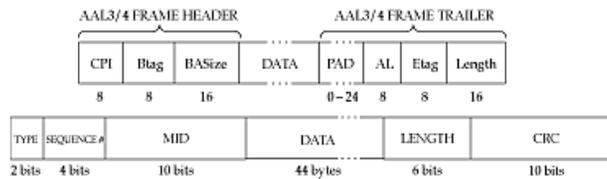

## AAL 3/4

- For data traffic (from a telco perspective!)
  - First create an encapsulated protocol data unit EPDU
    - (common part convergence sublayer-protocol data unit CPCS-PDU)
  - Then fragment it and add ATM headers

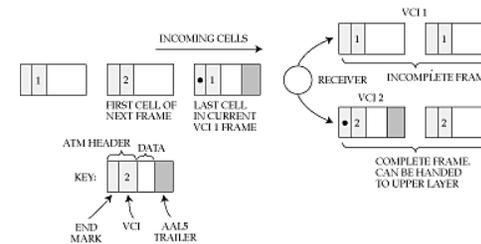

## AAL 3/4

- Error detection, segmentation, reassembly
- Header and trailer per EPDU *and* per-cell header!

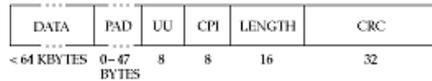

## AAL 5

- Violates layering, but efficient
- Bit in header marks end of frame

## AAL5 frame format

## SSCOP

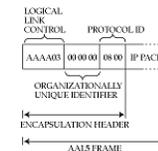

- Reliable transport for signaling messages
- Functionality similar to TCP
  - ◆ error control (described below)
  - ◆ flow control (static window)
- Four packet types
  - ◆ sequenced data / poll / stat / ustat
- No acks!
- Sender polls, receiver sends status
  - ◆ includes cumulative ack and window size
- If out of order, sends unsolicited status (ustat)
- Key variable is poll interval

## IP-over-ATM

- Key idea: treat ATM as a link-level technology
  - ◆ ignore routing and QoS aspects
- Key problems
  - ◆ ATM is connection-oriented and IP is not
  - ◆ different addressing schemes
  - ◆ ATM LAN is point-to-point while IP assumes broadcast
- Basic technologies
  - ◆ IP encapsulation in ATM
  - ◆ Resolving IP addresses to ATM addresses
  - ◆ Creating an ATM-based IP subnet
  - ◆ Mapping multicast groups to ATM

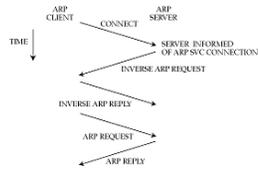

## IP encapsulation in ATM

- Put data portion of IP packets in AAL5 frame
  - ◆ works only if endpoints understand AAL5
- Instead, place entire IP packet with AAL5 frame
- General solution allows *multiprotocol encapsulation*

## Resolving IP addresses to ATM addresses

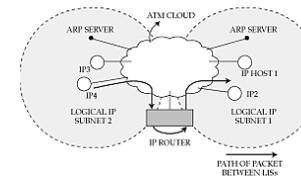

- Need something like ARP, but can't use broadcast
- Designate one of the ATM hosts as an ARP server

- Inverse ARP automatically creates database

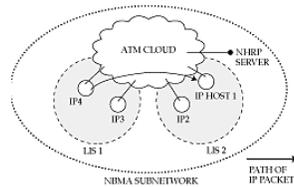

## Creating an ATM-based IP subnet

- IP assumes free availability of bandwidth within a subnet
- If all hosts on ATM are on same IP subnet, broadcast reaches all => congestion
- Partition into *logical IP subnets*
  - at the cost of longer paths between ATM-attached hosts

## Next-hop routing

- Avoids long paths
- Next-hop server stores IP-to-ATM translations independent of subnet boundaries
  - like DNS

## Resolving multicast addresses

- ARP server cannot resolve multicast addresses (why?)
- Actively maintain set of endpoints that correspond to a particular Class D address
- Multicast Address Resolution Server* provides and updates this translation
