## Computation Theory

### Exercise Sheet

**Exercise 1.** Show that the following arithmetic functions are all register machine computable.

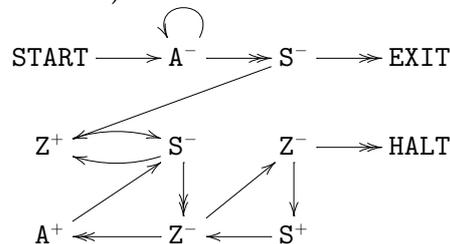

- (a) First projection function  $p \in \mathbb{N}^2 \rightarrow \mathbb{N}$ , where  $p(x, y) \triangleq x$
- (b) Constant function with value  $n \in \mathbb{N}$ ,  $c \in \mathbb{N} \rightarrow \mathbb{N}$ , where  $c(x) \triangleq n$
- (c) Truncated subtraction function,  $_ \dot{-} _ \in \mathbb{N}^2 \rightarrow \mathbb{N}$ , where  $x \dot{-} y \triangleq \begin{cases} x - y & \text{if } y \leq x \\ 0 & \text{if } y > x \end{cases}$
- (d) Integer division function,  $_ \text{div} _ \in \mathbb{N}^2 \rightarrow \mathbb{N}$ , where

$$x \text{ div } y \triangleq \begin{cases} \text{integer part of } x/y & \text{if } y > 0 \\ 0 & \text{if } y = 0 \end{cases}$$

- (e) Integer remainder function,  $_ \text{mod} _ \in \mathbb{N}^2 \rightarrow \mathbb{N}$ , where  $x \text{ mod } y \triangleq x \dot{-} y(x \text{ div } y)$
- (f) Exponentiation base 2,  $e \in \mathbb{N} \rightarrow \mathbb{N}$ , where  $e(x) \triangleq 2^x$ .
- (g) Logarithm base 2,  $\log_2 \in \mathbb{N} \rightarrow \mathbb{N}$ , where  $\log_2(x) \triangleq \begin{cases} \text{greatest } y \text{ such that } 2^y \leq x & \text{if } x > 0 \\ 0 & \text{if } x = 0 \end{cases}$

**Exercise 2.** Let  $\phi_e \in \mathbb{N} \rightarrow \mathbb{N}$  denote the unary partial function from numbers to numbers computed by the register machine with code  $e$ . Show that for any given register machine computable unary partial function  $f \in \mathbb{N} \rightarrow \mathbb{N}$ , there are infinitely many numbers  $e$  such that  $\phi_e = f$ . (Two partial functions are equal if they are equal as sets of ordered pairs; which is equivalent to saying that for all numbers  $x \in \mathbb{N}$ ,  $\phi_e(x)$  is defined if and only if  $f(x)$  is, and in that case they are equal numbers.)

**Exercise 3.** Consider the list of register machine instructions whose graphical representation is shown below. Assuming that register Z holds 0 initially, describe what happens when the code is executed (both in terms of the effect on registers A and S and whether the code halts by jumping to the label EXIT or HALT).

**Exercise 4.** Show that there is a register machine computable partial function  $f : \mathbb{N} \rightarrow \mathbb{N}$  such that both  $\{x \in \mathbb{N} \mid f(x) \downarrow\}$  and  $\{y \in \mathbb{N} \mid (\exists x \in \mathbb{N}) f(x) = y\}$  are register machine undecidable.

**Exercise 5.** Suppose  $S_1$  and  $S_2$  are subsets of  $\mathbb{N}$ . Suppose  $f \in \mathbb{N} \rightarrow \mathbb{N}$  is register machine computable function satisfying: for all  $x$  in  $\mathbb{N}$ ,  $x$  is an element of  $S_1$  if and only if  $f(x)$  is an element of  $S_2$ . Show that  $S_1$  is register machine decidable if  $S_2$  is.

**Exercise 6.** Show that the set of codes  $\langle e, e' \rangle$  of pairs of numbers  $e$  and  $e'$  satisfying  $\phi_e = \phi_{e'}$  is undecidable.

**Exercise 7.** For the example Turing machine given on slide 64, give the register machine program implementing  $(S, T, D) := \delta(S, T)$ , as described on slide 70. [Tedious!—maybe just do a bit.]

**Exercise 8.** Show that the following functions are all primitive recursive.

(a) Exponentiation,  $exp \in \mathbb{N}^2 \rightarrow \mathbb{N}$ , where  $exp(x, y) \triangleq x^y$ .

(b) Truncated subtraction,  $minus \in \mathbb{N}^2 \rightarrow \mathbb{N}$ , where  $minus(x, y) \triangleq \begin{cases} x - y & \text{if } x \geq y \\ 0 & \text{if } x < y \end{cases}$

(c) Conditional branch on zero,  $ifzero \in \mathbb{N}^3 \rightarrow \mathbb{N}$ , where  $ifzero(x, y, z) \triangleq \begin{cases} y & \text{if } x = 0 \\ z & \text{if } x > 0 \end{cases}$

(d) Bounded summation: if  $f \in \mathbb{N}^{n+1} \rightarrow \mathbb{N}$  is primitive recursive, then so is  $g \in \mathbb{N}^{n+1} \rightarrow \mathbb{N}$  where

$$g(\vec{x}, x) \triangleq \begin{cases} 0 & \text{if } x = 0 \\ f(\vec{x}, 0) & \text{if } x = 1 \\ f(\vec{x}, 0) + \dots + f(\vec{x}, x - 1) & \text{if } x > 1. \end{cases}$$

**Exercise 9.** Recall the definition of Ackermann's function  $ack$  (slide 102). Sketch how to build a register machine  $M$  that computes  $ack(x_1, x_2)$  in  $R_0$  when started with  $x_1$  in  $R_1$  and  $x_2$  in  $R_2$  and all other registers zero. [Hint: here's one way; the next question steers you another way to the computability of  $ack$ . Call a finite list  $L = [(x_1, y_1, z_1), (x_2, y_2, z_2), \dots]$  of triples of numbers *suitable* if it satisfies

(i) if  $(0, y, z) \in L$ , then  $z = y + 1$

(ii) if  $(x + 1, 0, z) \in L$ , then  $(x, 1, z) \in L$

(iii) if  $(x + 1, y + 1, z) \in L$ , then there is some  $u$  with  $(x + 1, y, u) \in L$  and  $(x, u, z) \in L$ .

The idea is that if  $(x, y, z) \in L$  and  $L$  is suitable then  $z = ack(x, y)$  and  $L$  contains all the triples  $(x', y', ack(x, y'))$  needed to calculate  $ack(x, y)$ . Show how to code lists of triples of numbers as numbers in such a way that we can (in principle, no need to do it explicitly!) build a register machine that recognises whether or not a number is the code for a *suitable* list of triples. Show how to use that machine to build a machine computing  $ack(x, y)$  by searching for the code of a suitable list containing a triple with  $x$  and  $y$  in its first two components.]

**Exercise 10.** For each  $n \in \mathbb{N}$ , let  $g_n$  be the function mapping each  $y \in \mathbb{N}$  to the value  $ack(n, y)$  of Ackermann's function at  $(n, y) \in \mathbb{N}^2$ .

(a) Show for all  $(n, y) \in \mathbb{N}^2$  that  $g_{n+1}(y) = (g_n)^{(y+1)}(1)$ , where  $h^{(k)}(z)$  is the result of  $k$  repeated applications of the function  $h$  to initial argument  $z$ .

(b) Deduce that each  $g_n$  is a primitive recursive function.

(c) Deduce that Ackermann's function is total recursive.

**Exercise 11.** If you are *still* not fed up with Ackermann's function  $ack \in \mathbb{N}^2 \rightarrow \mathbb{N}$ , show that the  $\lambda$ -term  $ack \triangleq \lambda x. x (\lambda f y. y f (f \underline{1})) \text{Succ}$  represents  $ack$  (where Succ is as on slide 123).

**Exercise 12.** Let  $l$  be the  $\lambda$ -term  $\lambda x. x$ . Show that  $\underline{n}l =_{\beta} l$  holds for every Church numeral  $\underline{n}$ . Now consider

$$B \triangleq \lambda f g x. g x l (f (g x))$$

Assuming the fact about normal order reduction mentioned on slide 115, show that if partial functions  $f, g \in \mathbb{N} \rightarrow \mathbb{N}$  are represented by closed  $\lambda$ -terms  $F$  and  $G$  respectively, then their composition  $(f \circ g)(x) \equiv f(g(x))$  is represented by  $B F G$ .
