

# Advanced Operating Systems

Through tracing, analysis, and experimentation

ACS/Part III L41: Advanced Operating Systems

Part II: Advanced Operating Systems

Lecture 1, Part 2: The Course

Prof. Robert N. M. Watson

2021-2022

# Why study operating systems?

The OS plays a central role in **whole-system design** when building efficient, effective, and secure systems:

- Strong influence on whole-system performance
- Critical foundation for computer security
- Exciting programming techniques, algorithms, problems
  - Virtual memory; network stack; filesystem; run-time linker; ...
- Co-evolves with platforms, applications, users
- Multiple active research communities
- Reusable techniques for building complex systems
- Boatloads of fun (best text adventure ever)

# Where is the OS research?

A sub-genre of **systems research**:

- Evolving hardware-software interfaces
  - New computation models/architectures
  - New kinds of peripheral devices
- Integration with programming languages and runtimes
- Concurrent/parallel programming models; scheduling
- Security and virtualisation
- Networking, storage, and distributed systems
- Tracing and debugging techniques
- Formal modeling and verification
- As a platform for other research – e.g., mobile systems

**Venues:** SOSP, OSDI; ATC; EuroSys; HotOS; FAST; NSDI; HotNets; ASPLOS; USENIX Sec.; ACM CCS; IEEE SSP; ...

# What are the research questions?

Just a few examples: By changing the OS, can I...

- Create new abstractions for new hardware?
- Make my application run faster by...
  - Better masking latency?
  - Using parallelism more effectively?
  - Exploiting new storage mediums?
  - Adopting distributed-system ideas in local systems?
- Make my application more {reliable, energy efficient}
- Limit {security, privacy} impact of exploited programs?
- Use new language/analysis techniques in new ways?

Systems research focuses on **evaluation** with respect to **applications** or **workloads**: How can we measure whether it is {faster, better, ...}?

# Teaching operating systems

- Two common teaching tropes:
  - **Trial by fire**: in micro, recreate classic elements of operating systems: microkernels with processes, filesystems, etc.
  - **Research readings course**: read, present, discuss, and write about classic works in systems research
- This module adopts elements of both styles while:
  - mitigating the risk of OS kernel hacking in a short course
  - working on real-world systems rather than toys; and
  - targeting research skills not just operating-system design
- Trace and analyse real systems driven by specially crafted benchmarks
- Possible only because of (fairly) recent developments in tracing and hardware-based performance analysis tools

# Aims of the module (1/2)

Teaching **methodology, skills, and knowledge** required to understand and perform research on contemporary operating systems by...

- Employing systems methodology and practice
- Exploring real-world systems artefacts through performance and functional evaluation/analysis
- Developing scientific writing skills (**L41 only**)
- Reading original systems research (**L41 only**)

# Aims of the module (2/2)

On completion of this module, students should:

- Have an understanding of high-level OS kernel structure.
- Gained insight into hardware-software interactions for compute and I/O.
- Have practical skills in system tracing and performance analysis.
- Have been exposed to research ideas in system structure and behaviour. **(L41 only)**
- Have learned how to write systems-style performance evaluations. **(L41 only)**

# Prerequisites

We will take for granted:

- **High-level knowledge of OS terminology** from an undergraduate course (or equivalent); e.g.,:
  - What **schedulers** do
  - What **processes** are ... and how they differ from threads
  - What **Inter-Process Communication (IPC)** does
  - How might a simple **filesystem** might work
- Reasonable fluency in **reading** multithreaded C
- Good working knowledge of Python
- Comfort with the UNIX command-line environment
- Undergraduate skills with statistics  
(mean/median/mode/stddev/*t*-tests/linear regression/boxplots/scatterplots ... )

You can pick up some of this as you go (e.g., IPC, Python, or *t*-tests), but will struggle if you are missing several

# Module structure – four complementary strands

- **Online lectures (6 hours; 2-3 segments per lecture)**
  - Theory, methodology, architecture, and practice
- **Assigned research and applied readings**
  - Selected portions of module texts – learn skills, methodology
  - Related research readings – research exposure (**L41 only**)
- **Online lab exercises (X3)**
  - Short online lecturelet introduces each lab
  - RPi4 cluster to run experiments (one board per student)
  - Module demonstrators available to answer questions
- **Lab assignments (Part II – X2) or reports (L41 – X3)**
  - Based on experiments done via lab exercises
  - Develop scientific + writing skills suitable for systems research
  - First lab has lower weighting as you learn baseline skills

# Outline of module schedule

- **Submodule 1: Introduction to kernels and tracing/analysis**
  - 1 lecture, 1 lab (I/O)
  - **Introduction:** OSES, Systems Research, and L41
  - **The Kernel:** Kernel and Tracing
- **Submodule 2: The Process Model**
  - 1 lecture, 2 labs (IPC, PMC)
  - **The Process Model (1)** – Binaries and Processes
  - **The Process Model (2)** – Traps, System Calls, and Virtual Memory
- **Submodule 3: The Network Stack (TCP/IP)**
  - 1 lecture, 2 labs (TCP state machine, congestion control)
  - **The Network Stack (1)** – Sockets, NICs, and Work Distribution
  - **The Network Stack (2)** – TCP protocol
- Each submodule has one lab report or lab assignment
- Please consult online materials for all deadlines

# The lab platform

- 50x Raspberry Pi 4 boards in a rack
  - Broadcom BCM2711 SoC
  - 4x 64-bit A72 ARMv8-A cores
  - 8GB DRAM, 64G SD Card
- FreeBSD operating system
  - DTrace tracing tool
  - HWPMC counter framework
  - Bespoke potted benchmarks motivating OS and microarchitectural performance analysis
  - Jupyter lab notebook environment
- Remotely accessed via SSH + tunneling for Jupyter

# Lab Assignments (Part II only)

- A series of questions requiring short answers
  - Answers consist of written text, selected data, and plots
  - Perform your work in the Jupyter lab framework
  - Your submission will consist of generated PDF of the completed lab notebook – e.g., by printing to a PDF file
  - Submissions are accepted only via Moodle
- Ensure that your submission is well presented; e.g.,
  - Plots don't span page boundaries or run off the side
  - Plots have clearly labeled axes, data sets, and so on
  - Make sure your text is concise and clear, addressing the questions that are answered
- Marked based on submitted data, text, and plots
- The third lab assignment (TCP/IP) is optional

# Lab Reports (L41 only)

Lab reports document an experiment and analyse its results – typically using **one or more hypotheses**.

Our lab reports will contain the following sections (see notes, template):

1. Title + abstract (1 page)	5. Conclusion (1-2 para)
2. Introduction (1-2 para)	6. References
3. Experimental setup and methodology (1-2 pages)	7. Appendices
4. Results and discussion (3-4 pages)	

Some formats break out (e.g.) experimental setup vs. methodology, and results vs. discussion. The combined format seems to work better for systems experimentation as compared to (e.g.) biology.

- The target length is **8 pages excluding appendices, references**
- **Over-length reports** will be penalized – please stop by the limit!
- **Appendices** will not be read if too long, and should not be essential to understanding the core content of the report

# Module texts – core material

You will need to make frequent reference to these books both in the labs and outside of the classroom:

**Operating systems:** Marshall Kirk McKusick, George V. Neville-Neil, and Robert N. M. Watson, *The Design and Implementation of the FreeBSD Operating System, 2nd Edition*, Pearson Education, Boston, MA, USA, September 2014.

**Performance measurement:** Raj Jain, *The Art of Computer Systems Performance Analysis: Techniques for Experimental Design, Measurement, Simulation, and Modeling*, Wiley - Interscience, New York, NY, USA, April 1991.

**Tracing and profiling:** Brendan Gregg and Jim Mauro, *DTrace: Dynamic Tracing in Oracle Solaris, Mac OS X and FreeBSD*, Prentice Hall Press, Upper Saddle River, NJ, USA, April 2011.

The FreeBSD and DTrace books are available online via vlebooks.com:

<https://www.vlebooks.com/Vleweb/Search/Keyword?keyword=freebsd>

# Module texts – additional material

If your OS recollections feel a bit hazy:

**Operating systems:** Abraham Silberschatz, Peter Baer Galvin, and Greg Gagne. ***Operating System Concepts***, Eighth Edition, John Wiley & Sons, Inc., New York, NY, USA, July 2008.

If you want to learn a bit more about architecture and measurement:

**Performance measurement and diagnosis:** Brendan Gregg, ***Systems Performance: Enterprise and the Cloud***, Prentice Hall Press, Upper Saddle River, NJ, USA, October 2013.

# Wrapping up

- In this lecture, we have:
  - Explored the idea of an operating system
  - Detailed the structure of the course and its expectations
- Our next lecture will explore:
  - DTrace, the kernel tracing facility we will use
  - The *probe effect* and its impact
  - The dynamics of kernel execution (just a taster)
- Readings for the next lecture:
  - Paper - Cantrill, et al. 2004
  - McKusick, et al. Chapter 3 (Kernel Subsystems)
