## Circuits

A circuit is a directed graph G = (V, E), with  $V = \{1, ..., n\}$  together with a labeling:  $I : V \rightarrow \{\texttt{true}, \texttt{false}, \land, \lor, \neg\}$ , satisfying:

- If there is an edge (i, j), then i < j;
- Every node in V has *indegree* at most 2.

```
    A node v has
indegree 0 iff l(v) ∈ {true, false};
indegree 1 iff l(v) = ¬;
indegree 2 iff l(v) ∈ {∨, ∧}
```

The value of the expression is given by the value at node n.

A circuit is a more compact way of representing a Boolean expression. Identical subexpressions need not be repeated.

CVP - the *circuit value problem* is, given a circuit, determine the value of the result node n.

CVP is solvable in polynomial time, by the algorithm which examines the nodes in increasing order, assigning a value true or false to each node.

CVP is complete for P under L reductions. That is, for every language A in P,

 $A \leq_L CVP$ 

# Reachability

Similarly, it can be shown that Reachability is, in fact, NL-complete. For any language  $A \in NL$ , we have  $A \leq_L Reachability$ 

L = NL if, and only if, Reachability  $\in L$ 

*Note:* it is known that the reachability problem for *undirected* graphs is in L.

## Provable Intractability

Our aim now is to show that there are languages (*or, equivalently, decision problems*) that we can prove are not in P.

This is done by showing that, for every *reasonable* function f, there is a language that is not in TIME(f).

The proof is based on the diagonal method, as in the proof of the undecidability of the halting problem.

## Time Hierarchy Theorem

For any constructible function f, with  $f(n) \ge n$ , define the f-bounded halting language to be:

 $H_f = \{[M], x \mid M \text{ accepts } x \text{ in } f(|x|) \text{ steps} \}$ 

where [M] is a description of M in some fixed encoding scheme. Then, we can show  $H_f \in \mathsf{TIME}(f(n)^2)$  and  $H_f \notin \mathsf{TIME}(f(\lfloor n/2 \rfloor))$ 

### Time Hierarchy Theorem

For any constructible function  $f(n) \ge n$ , TIME(f(n)) is properly contained in TIME $(f(2n + 1)^2)$ .

# Strong Hierarchy Theorems

For any constructible function  $f(n) \ge n$ , TIME(f(n)) is properly contained in TIME $(f(n)(\log f(n)))$ .

#### Space Hierarchy Theorem

For any pair of constructible functions f and g, with f = O(g) and  $g \neq O(f)$ , there is a language in SPACE(g(n)) that is not in SPACE(f(n)).

Similar results can be established for nondeterministic time and space classes.

### Consequences

- For each k,  $TIME(n^k) \neq P$ .
- $P \neq EXP$ .
- Any language that is EXP-complete is not in P.
- $L \neq PSPACE$ .
- $NL \neq PSPACE$ .
- There are no problems in P that are complete under linear time reductions.

## The End
